INDEX TO VOLUME 118

MINING AND SCIENTIFIC PRESS

January to June, 1919

A

Page

- Accidents in hoisting.... 180
- Accounting, graphical analysis of....W. E. Gaby.... 260
- Acetylene and hydrogen pas pipes.... 570
- Acid for leaching lead carbonates.... 278
  - Sulphuric, forecast for 1919.... 296
- Adamson, A. V..........Notes on powdered coal.... 92
- Agitator, origin of pachuca.... 627
- Air and chlorine, refining gold bullion with.... R. R. Kahan.... 48
  - And corrosion of cables.... 589
  - Compressors, all about them.... 746
  - Compressors, new types of small.... 728
  - Efficient compression of....C. A. Hirschberg.... 746
  - Piping for pneumatic tools, draining.... 389
- Alabama graphite, mining and milling.... 283
- Alaska ....Editorial.... 40
  - As a meat producer.... 475
  - Bulletin on Nelchina-Susitna area.... 615
  - Canning River region.... 542
  - Description of features.... 54
  - Examining a prospect in..F. LeRoi Thurmond.... 599
  - Investigations by H. V. Winchell.... 215
  - Metal output in 1918.... 68
  - Mineral development during 1918.... J. L. McPherson.... 45
  - Railroad administration ....Editorial.... 485
  - Railroad, appropriation for.... 227
  - Resources ....Editorial.... 587
  - Shortage of labor in.... 896
  - Terms, definition of some.... 599
- Alaskan Engineering Commission..William Gerig.... 113
- Alaska Gastineau Mining Co., company report...685, 827
- Alaska Gold Mines in 1918.... 130
- Alaska Juneau Gold Mining Co., company report.... 864
- Alaska Sulphur Co..... 475
- Alcohol in engines and engineers.... 801
- Alma, Colorado, letter.... 611
- Aluminum dust fires.... 156
  - Output of United States in 1918.... 339
- Amalgam from plates, removal of.... A. J. Herald and A. King.... 850
- Amalgamation at Oriental Consolidated mills.... 423
- American engineers in the War.... 874
  - Rights in Mexico.... 173
  - Ditto ....Editorial.... 203
  - Shipping problems.... 446
  - Supply of potash....Herbert Lang.... 5
- Americans and British traditions, outlook, and character.... 889
  - And foreigners at mines.... 696
- American Brass Co., some data on.... 201
- American Institute of Mining and Metallurgical Engineers, see A. I. M. E..... 309
  - Ditto....H. V. Winchell.... 393
  - Meeting at New York in February.... 310
  - Montana meeting....O. E. Jager.... 675
  - To meet at Chicago in September...Editorial.... 653
  - Winchell's views of the.... 218
- American Metal Co. and subsidiaries in North America and Mexico.... 592
- American Mining Congress.....J. F. Callbreath.... 186
  - Ditto ....Editorial....110, 175
  - And Chamber of Mines of Los Angeles.... 445
  - At Denver.... 129
  - At San Francisco.... 128
  - Directors for California chapter.... 132
  - Officers elected.... 303
  - To form Californian chapter.... 65
  - War minerals meeting at Washington.... 41

Page

- American Smelting & Refining Co. and copper prices 241
  - Changes in management.... 170
  - In Mexico.... 477
  - In 1918 ....Editorial.... 446
  - Operating data in 1918.... 458
- American Welding Society formed.... 440
- American Zinc, Lead & Smelting Co., company report 683
- Americanization ....Discount.... 313
  - Ditto....F. K. Lane.... 84
  - And Mr. Lane ....Editorial.... 73
  - At Seattle, victory of....Editorial.... 204
- Ammonia dynamites, notes on.... 251
  - From tar, separation of.... 356
- Anaconda and Chile.... 154
  - And publicity.... 882
  - And soldiers ....Editorial.... 173
  - Map showing activities in Western States.... 833
  - Reverberatories, improvements.... 875
  - Smoke-stack.... 752
  - To make calcium carbide.... 616
- Anaconda Copper Mining Co., company report.... 833
  - Bond issue ....Editorial.... 37
  - New stack.... 28
- Analysis of accounting, graphical....W. E. Gaby.... 260
  - Of good salt.... 530
  - Of graphite ore.... 256
- Analytical weights, metal for.... 384
- Anderson, F. B..........Banker and mining.... 254
- Anderson, L. D....Mechanical charging of silver-lead blast-furnaces.... 744
- Andes Copper Mining Co.'s operations.... 154
  - Progress.... 834
- Annealing furnace for crucibles.... 88
- Antimonial and arsenical organic compounds.... 342
- Antimony mining in Alaska dull.... 77
- Anyox, British Columbia, letter.... 718
- Apex law in Rhodesia.... 653
  - Rights in Elm Orlu case.... 629
  - Rights on narrow and undulating veins.... 407
- Arctic Canada, deposits of native copper in.... J. J. O'Neill.... 807
- Arctic Coal Co., Spitzbergen.... 7
- Argentine, Winchell's views on.... 217
- Argonaut mine, fire in....473, 540
- Arizona desert region sign-posted.... 27
  - Geologic investigation of south-eastern.... 717
  - Metal output in 1918.... 68
  - Social betterment in........A. M. Heckman.... 158
  - Valuation of mines.... 574
- Arizona Binghampton Copper Co. report on mine.... 165
- Arizona Commercial Mining Co., company report.... 581
  - V. Iron Cap over apex and drainage.... 368
- Arizona Copper Co., company report.... 407
- Arkansas, manganese mining in.... 418
  - Zinc output in 1918.... 130
- Army gas-masks in atmospheres containing sulphur dioxide, use of.A. C. Fieldner and S. H. Katz.... 773
  - Strengths ....Editorial.... 586
- Aron Hirsch & Sohn of Halberstadt.... 565
- Arsenic and antimony, organic compounds.... 342
  - Production in 1918.... 135
  - Recovery from silver-cobalt ore.... 125
- Arthur mill of Utah Copper Co., unloading, crushing, and screening at..........F. G. Janney.... 464
- Asbestos, iron compounds in.... 707
- Ashanti Goldfields Corporation ....Editorial.... 108
- Assay of silver metallics.... 125
- Atomic studies.... 330
- Attitude of employers..........P. B. McDonald.... 328
- Aurora Consolidated mines..........Editorial.... 108

Page

Australia allows gold exports 653
  And metal situation.......... Editorial.... 654
  Filter litigation in 506
  Gold production .... Editorial.... 446
  Gold situation in 160
  Metal output and German control.............. 566
Averell, A. J. .... Misfires.... 350

B

Balliet, Letson .... Bolts and spikes from scrap.... 327
Ball-mill operation..............E. W. Davis.... 503
Banker and mining.............F. B. Anderson.... 254
  Ditto ....Editorial.... 239
Banks in America 254
  In America and names.......................... 313
Barnes-King Development Co., company report...340, 829
Barneson, John, views on wages...................... 37
Barton, G. S.............Wheat and chromite.... 207
Basin, Montana, to be revived...................... 897
Bastin, E. S., and Laney, F. B.....Ores of Tonopah, Nevada 287
Battery, manganese in dry.......................... 874
Bayliss on mining conditions...................... 507
Beardsley, A. L..............Flotation patents.... 489
Bearing-metal properties 282
Becker, G. F., death of.......................578, 647
Beer, Sondheimer & Co. of Frankfurt..........565, 635
Bell, R. N.....Ventilation methods in Coeur d'Alene mines 397
Belmont Shawmut Mining Co., company report....... 645
Belmont Surf Inlet Mines, company report.......... 719
Belmont Wagner Mining Co., company report........ 680
Bendigo Amalgamated Goldfields, company report.... 104
Benedict, W. deL.................Status of gold.... 840
Benguet Consolidated Mining Co., company report.... 337
  Costs 463
Big issues and small minds............Editorial.... 804
Bill of relief for miners.......................... 24
Bimetallism ....Editorial.... 801
Bingham Mines Co., company report.............. 481
Bisbee, Arizona....161, 194, 261, 434, 473, 718, 826, 892
Bismuthinite-molybdenite ore, dressing.............. 253
Black sands and platinum.......................... 137
Blast-furnace, exist................O. E. Jager.... 843
  Mechanical charging of silver-lead.............. L. D. Anderson.... 744
  V. reverberatory furnaces 843
Blasting caps, misfires 350
  Old concrete 822
  Primer for 245
Blue Ledge copper mine, California.............. 824
Blue-sky laws......................J. T. Duce.... 734
  Ditto ....R. M. Harrop.... 873
  Legislation in Ontario ....Editorial.... 549
Boarding-houses on mines 222
Bohm, W. D. ....Who will hold the sack?.... 661
Boilers, air to be pure before entering.............. 538
  How to lay-up 591
  On dredges 323
Bolivia wolfram output 398
Bolshevism ....Editorial....107, 447
  And mining in Russia............Editorial.... 139
  Upstairs ....Editorial.... 521
Bolshevist propoganda ....Editorial.... 550
Bolts and spikes from scrap.......Letson Balliet.... 327
Bonus for gold producers.......................... 9
Boston & Montana Development Co., progress of..... 63
Boston Ely Consolidated Mining Co., organized...... 369
Boulder county, Colorado, notes on.................. 26
Bowles, A. C. ....Use and abuse of crucibles.... 505
Braden mill, Chile, new machinery.................. 751
Bradley, F. W., opinion on lead market.............. 202
Brazil, gold embargo 192
  Manganese exports and prices...................... 418
Brick from mill slime in India...................... 260
Brief on status of chrome industry .... Courtenay De Kalb.... 13
Brinsmade, R. B. .... Leasehold v. fee-simple tenure for mineral land 177
Briquette output of United States in 1918 339
British and bureaucracy ....Editorial.... 768
  Dominions, gold production in.............. William Frecheville.... 220
  Government gold investigation.................. 160
British Columbia Chamber of Mines, nee Vancouver... 302
  Chamber of Mines activities 413
  Metal output of 160
  Mining opportunities 414

Page

British Columbia, silver mining in Portland Canal region 718
British Consols, notes on.......................... 382
British Guiana, gold mining in...................... 160
Broad Pass, Alaska........F. LeRoi Thurmond.... 57
Broken Hill Associated Smelters plant.............. 777
Broken Hill, flotation of galena at Central mine...... R. J. Harvey.... 149
Brooks, E. W............Water laws of Nevada.... 209
Brown, F. C............Invention: What is it?.... 626
Brown, G. E........Mine development in China.... 662
Bunker Hill & Sullivan Mining & Concentrating Co., company report 864
  All costs at 751
  And lead market 202
  Cost of producing lead.......................... 683
  Sweeney mill 504
  Ventilation of mine 397
Burmese tungsten ....Editorial.... 271
Burro Mountain Copper Co., shoveling tests by....... 472
Bush, J. E..........In behalf of the prospector.... 274
Bush silver mine, B. C................Editorial.... 485
Business conditions in March...................... 349
  Outlook ....Editorial.... 238
Butte, Montana 261, 612
  Addition of School of Mines...................... 918
  Extra-lateral rights at 629
  Labor troubles in February...................... 228
  Progress of strike 266
Butte & Superior and Minerals Separation....Counsel for defendant 737
  Ditto................Counsel for petitioner.... 708
  Ditto..............Supreme Court decision.... 845
Butte & Superior Mining Co., company report....336, 828
  Fire prevention in 752
  Loses apex suit to Elm Orlu company.............. 336
  Products ....Editorial.... 345
  Recoveries and profits 730
  V. Elm Orlu case.............................. 629
Butte Copper & Zinc Co., company report............ 438
Butte Copper Czar Mining Co.'s circular............ 695
Buy it now.................C. T. Hutchinson.... 349

C

Cables, corrosion of.....................A. N. C.... 842
  In place, oiling mine........W. F. Robertson.... 735
  Internal corrosion of........W. F. Robertson.... 589
Cactus silver district 754
Cadmium production and use in solders.............. 664
Calamine in 1918, average price.................. 96
Calcium carbide derivatives........F. H. Mason.... 432
  Carbide to be made by Anaconda.................. 616
Calcreose for influenza..........................71, 93
  Ditto ....Editorial.... 138
Caledonia Mining Co., company report.............. 616
California and the East..............Editorial.... 309
  Black sand deposits, map of...................... 264
  Chrome and manganese deposits.................. 369
  Desert region sign-posted 27
  Electric power used by mines.................... 707
  Gold and oil production.......................... 368
  Industrial accidents in 820
  Metal output in 1918.............................. 68
  Metallurgical journey to Shasta.............. Herbert Lang....557, 812
  Mineral output in 1918.......................... 77
  Minerals administration..........Editorial.... 238
  Oil and gas output in 1918...................... 755
  Oil legislation in 512
  Oil output in 1918.............................. 165
  Oil wages 368
  Oregon boundary region 857
  Output of certain minerals in 1918.............. 646
  Petroleum and European war....J. H. G. Wolf.... 353
  Petroleum statistics, graph of.................. 355
  Pioneer life in—a review........G. H. Smith.... 362
  Proposed change in State insurance.............. 313
  Quicksilver output in 1918...................... 135
  Quicksilver resources of, new book.............. 33
  Wine industry 521
California State Mining Bureau opens two branches... 721
Callbreath, J. F......American Mining Congress.... 186
Calumet & Arizona Mining Co., company report...... 763
Calumet & Hecla mill improvements.................. 530
Camp Bird and Santa Gertrudis affairs.............. 205
  Report on conditions 436
Canada, deposits of native copper in Arctic.......... J. J. O'Neill.... 807
  Graphite figures corrected 640

Page
Canada, graphite ore milled in.... 398
  In 1918, mineral output of 502
  Magnesite output in 384
  Mineral production in 1918 430
  Prospecting in ....Editorial.... 769
Canadian gold exports ....Editorial.... 729
  Platinum output 454
Canadian Klondyke Co. and dredge repairs by welding. 716
  Dredging results 707
Canadian Mining Institute meets 309
Cananea, Mexico, letter 435, 474, 641, 825
Capital and labor 877
Caps, misfires in blasting 350
Carbide of calcium derivatives......F. H. Mason.... 432
Carbonate of zinc ores at Leadville.... 226
  Ores, leaching of lead from .... D. A. Lyon and O. C. Ralston.... 277
Car-dumper at Arthur mill, Utah.... 464
Carson Hill Gold Mining Co., California.... 720
Cement production in 1918.... 442
Central and South American commerce.... 276
Central mine, Broken Hill, flotation of galena at..... R. J. Harvey.... 149
Cerro Gordo Mines Co., company report.... 679
Ceylon graphite exports in 1918.... 527
Chalk production of England 714
Chamber of Mines of Los Angeles and American Mining Congress ....Editorial.... 445
Charging of silver-lead blast-furnaces, mechanical.... L. D. Anderson.... 744
Chartran, H. R....Russia.... 116
Chase, R. L.......Oil-shale industry in Colorado.... 82
Chemical Exposition in September......Editorial.... 867
Chemicals and cost at Benguet, Philippines.... 463
  Prices for five years 651
  Works, new 764
Chemistry, definition of organic 82
Chief Consolidated Mining Co., company report.... 793
Chihuahua, Mexico 788
Chile Copper Co.'s output in 1918.... 156
Chile-Peru territory, minerals in disputed.... 78
China, iron ore reserves 876
  Mine development in ....G. E. Brown.... 662
  Mineral enterprise in, new book.... 687
  Shortage of silver in 338
Chinese tungsten ore exports 126
Chino Copper Co., company report....336, 725
Chloride, Arizona 573
  Developments 757
Chlorination in Shasta, California, early.... 813
Chlorine and air-refining gold bullion with.... R. R. Kahan.... 48
Chosen, the Unsan Mines in 419
Chrome and other miners relief passed by Congress... 305
  Industry, brief on status of.... Courtenay De Kalb.... 13
  Manganese, and tungsten miners to be repaid..... 311
  Production and imports 13
  Scandal ....W. H. S.... 113
Chromite and wheat....G. S. Barton.... 207
  Imports in January 454
  Imports in 1918 398
  In Wyoming, and ferro-chrome in Colorado...... 570
Cinchonine solution test for tungstic oxide.... 432
Clemenceau, Georges ....Editorial.... 271
Coal and iron of France.... 610
  Development in Alaska 47
  In Alaska, some history 215
  Powdered as substitute for fuel-oil.... 235
  Powdered, notes on....A. V. Adamson.... 92
  Pulverizing and blowing machinery for.... F. B. Coffin.... 375
Cobalt, Ontario 226, 332, 754, 823
  By-products of ore.... 389
  Discovery of 780
Cobalt, removal from zinc sulphate electrolytes...... 286
  Silver ore, smelting and refining of.... S. B. Wright.... 125
Coeur d'Alene, Idaho, wages in.... 402
  Ventilation methods in mines.....R. N. Bell.... 397
Coffin, F. B....Pulverizing and blowing machinery for powdered coal.... 375
Coghill, W. H...Device for flotation experiments.... 495
Colombia to tax platinum exports.... 21
Colorado counties ore smelted and metal output in 1918 130
  Dredging areas 122
  Ferro-chrome in, and chromite in Wyoming...... 570
Colorado metal output in 1918 68
  Mining affairs 225
  Oil-shale in 701
  Oil-shale industry in....R. L. Chase.... 82
  Oil structures in 299
  Shale, oil in 116
Colorado Manufacturers Association and Colorado Pitchblende Co. 429
Colorado Pitchblende Co.....412, 429
  Ditto.... R. A. Parker.... 553
  Affairs 26
  Its history 366
  Notes on 265
  Peculiar happening 792
  Progress of investigation 299
Colville Indian Reservation, Washington, minerals in. 266
Company report:
  Alaska Gastineau Mining Co.... 685
  Alaska Juneau Gold Mining Co.... 864
  American Smelting & Refining Co.... 446
  Anaconda Copper Mining Co.... 833
  Arizona Commercial Mining Co.... 581

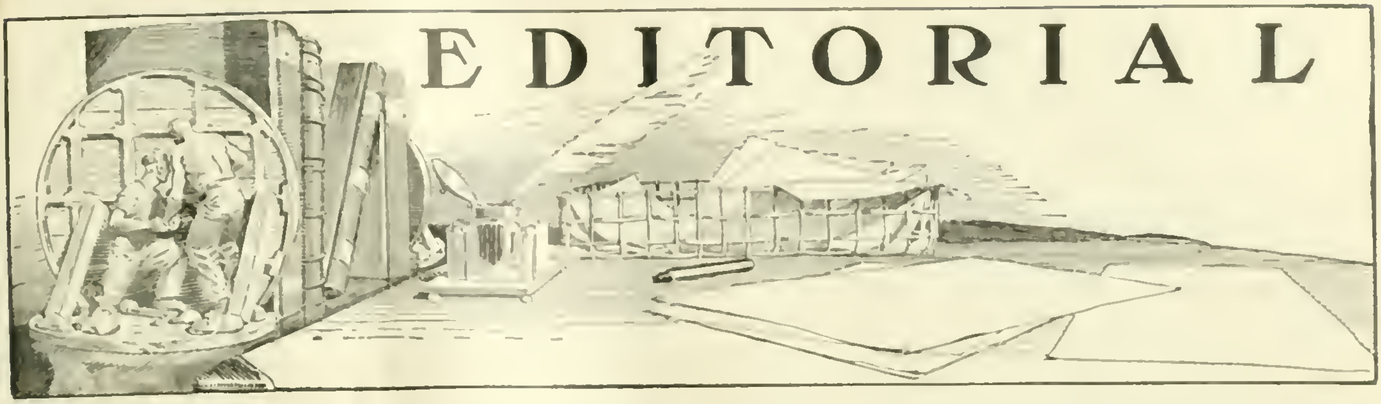
EDITORIAL



PRESIDENT WILSON has received an enthusiastic welcome in England, as was to have been expected. It is amusing to read the sub-heading in one of our San Francisco papers saying that the reception was "the greatest ever accorded to a foreign citizen," as if the President would feel himself a 'foreigner' in a land in which his native language is spoken, in which his mother was born, and from which his grandfather came. There are three kinds of people in the world Americans, British, and foreigners.

ALREADY the workers are returning from military service to their places at the mines. Juneau reports a turn in the tide of migration that at one time threatened to paralyze local industry. Similar news comes from other mining districts. We hope and believe that there will be no hesitation in giving the 'boys' their old jobs, if not better ones. All the talk in the world in the way of praise to our young men for their patriotic service will not compensate for their having to wait for the work they are willing to resume. This applies to the technical staffs of the mines, mills, and smelters. The returning soldiers and sailors must be given first consideration. They deserve it, having proved themselves good citizens. Most of them will have benefitted from the intensive education of military service and should prove to be not only as good as before but better. Make room for the soldier boys!

DURING November the American production of copper, including that from mines controlled by American capital in South America, was 148,763,000 pounds, or about 6,000,000 pounds less than in October. The decrease is not remarkable, having regard to the holidays, which include not only Thanksgiving but the day of the Armistice. It is estimated that 800,000,000 pounds of copper is in transit, awaiting refining, and in surplus stocks. The total output for 1918 will be about equal to that of 1917. The demand for the metal is being withheld pending a decrease in price, which is inevitable. At London sellers offered metal at £100 and buyers quoted only £62 immediately after the withdrawal of Government control, this meaning that whereas sellers asked 21 cents per pound the buyers offered only 13⅜ cents. No business was done; which is typical of the situation. In the United States the supply of labor is improving appreciably, but no effort is being made to cut wages, so that no radical reduction in cost is likely for the present. The existing scale of wages is based upon a 26c. price for copper. Smelter purchases are being made now on a preliminary settlement at 15 cents per pound. This hiatus cannot continue indefinitely.

PRISONERS of war released by the Germans are furnishing damning testimony to the inhumanity of the Huns. American officers writing home tell about the terrible condition of the poor fellows whom they are succoring as soon as they reach the zone occupied by the troops of the Allied Armies; they tell how abominably the prisoners have been treated and how the miserably small allowance of food was cut down as against American prisoners. British soldiers returning from captivity are in a horrible condition, many of them having to be sent either to a hospital or an asylum immediately on their arrival in England. The Germans have a black account to settle and all the whining, accompanying the kamerad act, should not obscure the need for settling the account on terms of stern justice. As Cardinal Mercier has said, "There is no Christian justice without charity and no charity without justice."

IN this issue we publish the findings of the committee appointed in July 1918 by the Secretary of the Interior "to investigate the gold-mining situation in the United States." This committee consisted of Messrs. Hennen Jennings, chairman, J. H. Mackenzie, and Charles Janin, all of the U. S. Bureau of Mines, with H. D. McCaskey and F. L. Ransome of the U. S. Geological Survey. Their report is dated October 30. The style of publication indicates the fact that there was much difficulty in expediting the issuance of the report owing to the enormous demands on the capacity of the Public Printer at Washington. We give the findings of this committee because they will interest many of our readers and because we have a large measure of respect for the gentlemen who prepared it, but we are frank to say that it throws no new light on the subject. All the data in the report that are of any consequence have appeared already in various issues of our paper and the suggestions of the committee call for no fresh comment. We believe that the gold 'situation', meaning the unfortunate economic status of the metal during the War and the effect of it upon mining operations, will be remedied automatically by the conclusion of peace, when the nations will have to resume the settlement of their balances by the transfer of gold bullion and by lifting the embargoes on the shipment of the metal in trade. We take pleasure in reproducing a table prepared by Mr. Charles Janin, who acted as secretary to the committee. This table is well worthy of close study, and criticism: it gives the cost of producing a dollar's worth of gold during the three years 1913, 1917, and 1918, showing how this has risen from 57 to 70 cents, such increase however being due apparently to the decline in the yield of gold per ton of ore rather than to any increase in the cost of recovery. Comparisons are vitiated by the decrease of development and the stoping of ore previously made accessible. The effect of higher wages and dearer supplies has been to curtail exploratory work and to prompt the extraction of ore ready to hand. Any statistics that show a decrease in the total cost of gold mining are certain to be wrong.

MR. HOOVER'S reply to Baron von der Lancken and Dr. Reith was keenly appreciated, especially by those who remembered that the name of the first is associated with the killing of Nurse Cavell, whereas the second was born in Belgium and is for that reason particularly detested as an agent of German tyranny. They wired to Mr. Walter L. Brown, an American mining engineer now director for the Commission for Relief in Belgium, whose article on 'Rotterdam, the distributing centre for the C. R. B.' appeared in our issue of September 21. In their telegram these two German officers notified Mr. Brown of their appointment to negotiate with Mr. Hoover for food supplies, whereupon he telegraphed to Mr. Brown saying: "You can describe two and a half years of arrogance toward ourselves and cruelty to the Belgians in any language you may select, and tell the pair personally to go to hell with my compliments. If I do have to deal with Germans it will not be with that pair." This may be shirt-sleeve diplomacy, but there are times when it has more dignity than the insincerities of conventional diplomacy. To Mr. Hoover there must have been much satisfaction in sending that message, and we share his satisfaction.

ON another page we publish a letter giving some interesting details concerning the Arctic Coal Company's operations on one of the islands of the Spitzbergen group. It will be noted that this American company sold out to a Norwegian company in April 1916. Apparently the British expedition that made a landing upon Spitzbergen on August 30 was organized by the Northern Exploration Company, which sent the 'Ella', in charge of the famous Arctic explorer, Sir Ernest Shackleton, accompanied by Captain Frank Wild and two mining engineers, Messrs Arthur and Bertram Maugham, father and son. Two convoying vessels were torpedoed by German submarines before Tromso, in Norway, was reached. The Norwegian press was full of threats against the expedition. Sir Ernest Shackleton was recalled by the War Office and Captain Wild took command of the 'Ella', which reached her destination on Lowe Sound without further mishap. It is reported that iron deposits of great value were discovered, besides coal measures, but the report concerning the iron is not convincing. Remains of a Zeppelin base established by the Germans were found and destroyed at Ebeltoft Haven. A fully equipped party of miners was landed at Davis City to exploit the "vast coalfields" of the Northern Exploration Company, so it is said. No mention, curiously enough, is made of the Arctic Coal Company's operations and establishment, although these must be far the most important on the island. The 'Ella' returned safely after having "defeated the German aim to establish a coaling, submarine, and Zeppelin base within 38 hours' steam of Great Britain," so says the London 'Graphic', from which we quote. It looks to us as if the Northern Exploration Company has acquired the Norwegian rights to the Arctic Coal Company's property and that the description refers to the workings and plant of that former American venture. The photographs and the mention of an aerial tramway alike suggest this inference.

WE publish the text of the brief presented to Congress in behalf of the chrome producers. This was prepared by Mr. De Kalb, who has spent the last three months at Washington in behalf of the Chrome Producers' Association. The 'Mining and Scientific Press' was glad to give his services in an effort to assist the cause of our Western miners and to rectify what seemed to us to be a public wrong. Even those wholly detached from the mining of chromite will find the brief interesting, on account of the information it contains and the lucid statement of the case that it presents. We regret being unable to give space for the various exhibits, but their character is fairly well indicated. A good deal of bitterness is felt in the West against Mr. Hugh W. Sanford personally as the official chiefly responsible for issuing misleading advices and as one whose actions favored the buyers of chromite rather than the industry itself. His letter to Mr. N. J. Sinnott and his telegrams to Messrs. W. F. Berger and F. J. Koster will be printed in our next issue. Although the Geological Survey and the Bureau of Mines must take some share of the blame for inciting the miners to a production for which no adequate market was forthcoming, it must be conceded that these bureaus were misled by the group of buyers to whose benefit the scheme seems to have inured. The entire control of the chromite industry appears to have been vested in the Ferro-Alloys Committee, which consisted entirely of buyers and their representatives. On another page we give the text of the bill that has been presented to Congress in order to give relief to those injured by the chrome fiasco. In our next issue we shall give our readers a detailed account of the meeting on December 16 called by the American Mining Congress to discuss this subject at Washington.

The Copper Export Association

Details concerning the Copper Export Association, organized by the principal producers of copper, will be found in this issue. The directorate is a 'Who's Who' in the copper world, for it includes representatives of all the 'big interests', as they are called by the financial reporter. Mr. Simon Guggenheim is chairman of the Board, the representative of the Anaconda is president, and the representatives of the Phelps Dodge and Calumet & Hecla groups respectively are the vice-presidents. Mr. Joseph C. Clendenin, of the American Smelting & Refining Company, is chairman of the selling committee. His office for the present will be at 42 Broadway, New York. Mr. John D. Ryan, speaking for the Association, made a number of remarks all of which will be read with keen interest. The idea is to establish a collective selling agency for the marketing of copper abroad, thereby avoiding the handicap under which formerly the producers of copper in this country were placed when dealing with the combination of buyers in Europe. An eye has been kept on the Federal Trade Commission; in the first place, the organization is made in conformity with the Webb Act legalizing combinations for the regulation of export trade; next, the small producers are invited to join the big fellows, so that none need feel that he has been left out in the cold. Nominal brokerage fees are to be charged and something additional to pay expenses. It is stated that the War Industries Board sent representatives to Europe before the armistice was signed in order to determine the copper requirements for 1919 and that they reported a probable demand for a billion pounds of the metal, to be increased by half a billion more if Germany regains a normal financial footing. It is estimated that Great Britain will take 200,000 long tons, France 145,000, and Italy 85,000 tons. Meanwhile, of course, the meetings of this Export Association enable the producers to discuss other subjects, such as the weather and the domestic production of copper. It is understood that a general reduction of output is to be made forthwith, beginning with a cut of 15% per month, until the supply of copper ceases to be in excess of the demand. The copper producers, like others engaged in mining the metals needed for the War, have been rushing production in response to the urgent solicitation of the Government and now like other metal producers they find themselves with unsold stocks since the Government ceased to buy on December 20. Costs are high, particularly labor, and no immediate reduction is practicable so long as the cost of living remains where it is. Therefore the policy will be to stop all over-time, to discharge inefficient men, and to reduce the output until Europe resumes buying of copper on a large scale. When an over-supply of labor becomes available, the rate of wages will be lowered in accordance with the equity of the case, for the existing pay is based upon copper at 26 cents. Some re-sales have taken place, it is rumored, at a price as low as 19 cents, and all signs point to something like 20 cents as the price to prevail during the period of reconstruction.

After the War

The new year dawns rich in promise. Behind us the thunder-clouds of war retreat sullenly while in front the glad sun of peace is rising over a battle-scarred world. The talk of reconstruction almost drowns the conversations of the peacemakers, although until peace is formally ratified and the system of war-controls expires we shall not feel the full force of the new conditions amid which we are to live henceforth; nevertheless every engineer and every manufacturer is already appraising the probabilities becoming discernible. The mining profession has come out of the War comparatively unscathed and with added self-respect. Our engineers responded promptly to the national call and if they suffered fewer casualties at the front than from the influenza at home it was not for lack of willingness to go wherever duty called them. As against a very small number of casualties there is set their inspiring experience of service in the Army and Navy, and the widening of their intellectual horizon. Ample reasons exist for optimism, despite the great destruction of life and capital in Europe during the four years of battle, murder, and sudden death. The United States, as compared with the other belligerents, has suffered little from loss of life or of capital; indeed, the increased efficiency of the living brought about by the stimulus of a great emergency has made this country industrially stronger, and the waste of capital in the materials of warfare has been largely compensated by the big purchases made in the United States by the Allied governments both before and after our own participation in the conflict. The War leaves America richer not only in money but in character. The stock of money in the United States has increased from $34 per capita in 1914 to $56 per capita at the present time. It is true, the National Debt has been increased by some twenty-five billions of dollars, but the bonds are held by our own people and the interest on them remains at home. Even though taxes are heavier, they are paid to the Treasury, which returns the money to the bondholders, who are also the taxpayers. No national impoverishment is involved in the transaction. The United States has lent 8½ billions to the Allied governments, and private investors in this country have lent fully 2 billions more, so that we shall be receiving some 500 million dollars per annum as income from Europe, whereas before the War we were remitting 20 million dollars per annum on the 5 billions of American securities held abroad, of which three-quarters has been repurchased during the War, reducing the interest correspondingly. Besides remittances to Europe on this account we paid freights for transporting goods in foreign bottoms, insurance in foreign companies, and the money spent by our people as tourists in Europe, so that the annual merchandise trade-balance of 500 million dollars was almost entirely offset. Now that a tremendous tonnage of foodstuffs will be shipped to Europe, besides a great mass of materials for reconstruction, the balance in our favor will be at least a billion dollars per annum.

which added to the half a billion income on loans to the Allies will yield $1,500,000,000 payable annually from abroad to the United States. These favorable financial conditions should last at least three years. From a debtor we have changed to a creditor nation. As soon as the work of rehabilitation and reconstruction begins in the countries devastated by war there will be a demand first for food, then for clothing, then for steel and the other goods of manufacture. The immediate demand will be for raw materials. The food sent to Europe will be paid for, at good prices, for there is no reason to suppose that any of it, least of all to the enemy countries, will be gratuitous. We shall send 20,000,000 tons of food to Europe this year. The farmer is assured a splendid market for his products. The lack of clothing in Europe will create a strong demand for cotton and wool. The Southern States should be rendered prosperous thereby. An insistent call for metals is inevitable; the miners of the West will benefit from the consumption consequent upon the rebuilding and re-equipment necessitated by German frightfulness. There are 4000 tons of machinery and tools waiting for shipment in New York harbor and orders for $10,000,000 worth of mining machinery for the French coalfields have been placed already. A statistical comparison demonstrates the commanding position of the United States in its possession of a preponderant share of the raw materials of civilization.

	Coal %	Iron %	Copper %	Gold %	Petroleum %
United States	52	63	56	19	64
British Empire	23	18	11	63	2
Germany and Austria	6	2	3	.	2
France, Belgium and Italy	1	2		...	...
All other countries	18	15	30	18	32

An immense quantity of the materials of construction is needed in Europe. Mr. William C. Redfield, the Secretary of Commerce, states that materials for building more than a million houses will be required in Belgium and France, but even such a statement fails to suggest the amount of reconstruction necessitated by the destruction of cities, railways, roads, bridges, factories, foundries, with their contents of machinery and tools, not only in Belgium and France, but in the devastated regions of eastern and south-eastern Europe. Much of this material, particularly the machine-tools and other elements of skillful manufacture requiring the consumption of metals, must be provided by the United States. It is proper to add that difference of opinion exists as to the prospects of supplying Europe. Mr. C. W. Barron thinks that not much will be required in the devastated areas because local brick and mortar, reinforced by timber, will suffice for the villages of France and Belgium, and he seems to belittle the need of steel and other metals in the cities that have been shelled and looted. Judge Gary expects to see an expansion of the trade in steel products with South America and South Africa, rather than with Europe, but he predicts confidently that "the next five years in this country will be the most progressive, prosperous, and successful in its history." In the past a large part of the metal production of this country and of the overseas dominions of Great Britain was in the control of German combinations having their headquarters at Frankfort. The Alien Property Custodian has broken the German hold on the American metal trade and has thereby offered new opportunities for the distribution of the miner's products abroad and new chances of American participation in the exploration and exploitation of foreign mineral regions. Here we come to a fundamental consequence of the financial change caused by the War. This country cannot expect either to increase its exports or even to collect the interest due on its loans abroad except by the further extension of credit. As Mr. George E. Roberts of the National City Bank insists, we shall have to capitalize the interest payments and re-invest them abroad. If we want to sell goods to our foreign customers, we shall have to buy their bonds and stocks. We shall have to increase our investments abroad. On that point every intelligent economist agrees. This conclusion is of immediate interest to the mining profession. Just as England before the War was the great creditor nation and had to find an outlet for her capital by adventure in foreign lands, so now the United States will find a logical consequence of her creditor position in the urge to use her surplus income and surplus energy in foreign enterprise, including mining. A beginning, a handsome beginning, has been made in copper mines in South America. A large amount of capital had been placed in Mexican mines before the European war and before the Mexican revolution; there will be a hearty resumption of American activities in Mexico as soon as political conditions improve south of the Rio Grande. By the way, it is fairly obvious that one of the first results of the Peace Conference at Versailles, a consequence both complementary and complimentary, will be a polite suggestion to Uncle Sam that he ought to clean up his backyard. Turning to other parts of the world, in Siberia the American participation in mining development has been less important in money than in men, for a considerable number of our best engineers have taken part in the work, mainly financed at London and Paris. Siberia is a continental area of large and varied mining potentialities; we expect to see an increased American interest in that direction and the growth of trade in machinery between San Francisco and Vladivostok. Even in South Africa, more distant as it may seem, it is noteworthy that during the period of the War there has been a considerable investment of American money on the part of some of our cleverest financiers in the development of mines on the Rand. We refer to the Anglo-American Corporation of South Africa, with which several American engineers are closely identified. Again, in the country of our good neighbors the Canadians, it is noteworthy that most of the important metal-mining enterprises of British Columbia are controlled by citizens of the United States. This we take to be a sign of the times. The American engineer never was parochially minded, he must enlarge his horizon and prepare to apply his home experience to regions farther afield. This we believe will be the salient feature of American mining enterprise *après la guerre*.

DISCUSSION

The American Supply of Potash

The Editor:

Sir—Under late dates the newspapers have quoted some remarks by Secretary Lane of the Interior Department, regarding the increased potash production of this country that to people conversant with the actual conditions may seem somewhat misleading. A few words in criticism may not be out of place. Referring to the strangle-hold that Germany had upon the potash market of the world prior to the War, the Secretary announces that "within two years the United States can become entirely independent of Germany through the development of our own resources, and by the use of processes devised by persons connected with the Department of the Interior."

From these words it would naturally be inferred that the authorities at Washington had played a great part in the up-building of this indispensable industry and fully expected to have finished the work about the end of the Wilsonian regime, two years hence. The facts, however, are entirely at variance with these claims, as will be shown in this brief résumé of the industry, which depends wholly upon private enterprise for whatever measure of success has attended it since the beginning of the War. If the Government has given it any practical assistance that fact has not yet been pointed out. I might go further and assert, without much fear of being controverted, that the Government has opposed rather than assisted the industry. At least I can say truthfully that it has opposed, through its agents, every large attempt to make potash. I take it, therefore, that the honorable Secretary either is misinformed on the subject, or that he was indulging in political camouflage. It will be worth while to examine briefly the economic aspects of potash-making.

Potash is mined, manufactured, and marketed in a variety of forms, which for discussion are ordinarily brought into statistics in the single form of the oxide of potassium, K_2O. In a normal year the country consumes the various products to the extent of 260,000 tons of oxide. The gross weight of all the compounds in such a year is well over a million tons. Nearly nine-tenths of the whole goes into artificial fertilizers, potash being, as is well known, an important, if not indispensable, element of fertility. The remaining tenth is taken for the manufacture of chemicals, soap, glass, matches, explosives, and a multitude of other necessary and common articles. The farmers, therefore, were the principal customers of Germany, which, before the War, supplied the United States with nine-tenths of all the potash used. Germany, by virtue of her enormous deposits of potash-bearing minerals, cheaply mined, was under-selling the world, and rapidly becoming rich. Our potash production virtually ceased, wrecking what, with judicious encouragement, would have become of national importance. But the free-trade proclivities of the Washington authorities had done their work and we were left helpless when the War began. Since that date imports have ceased, the land has received no potash, the crops in some regions have sunk far below the normal, and the question of proper fertilization is rapidly coming to the front. The price of potash compounds had risen within a year or two from ten to thirteen times the pre-war prices, and the small amount produced had to be devoted only to those manufactures which could afford to pay such prices. Chloride of potassium, which in its crude form sold at New York in the spring of 1914 for $38 per ton, brought in 1917 as much as $400 per ton, and still brings almost as much, in spite of the great efforts that have been and still are being made to produce it. The production of potash now, after four years of energetic work and the expenditure of much money, is still small, as we shall see. To show its actual extent, after four years of struggle, I append the following table, prepared from the U. S. Government statistics. By this it will be seen that we produced last year about one-eighth the normal requirements of the country, the content in potassium oxide being only 32,366 tons, valued at $13,791,972 at the points of production, which is a gratifying increase over the production of the preceding year, namely, a little short of 10,000 tons.

Potash Produced in the United States in 1917

Sources	Number of producers	Total, tons	K_2O contents, tons	K_2O, %	Total value of shipping-point
Natural brines	10	79,876	20,652	55	$8,200,499
Alunite	3	7,150	2,402	33	892,763
Cement-dust	8	13,582	1,621	11.9	700,000
Blast-furnace dust ...	3	2,133	185	8.7	68,841
Kelp	10	11,306	3,572	31.6	2,134,815
Distillery refuse	4	8,589	2,840	33.1	1,130,907
Wood-ash	36	706	424	60	406,836
Sugar-refinery refuse..	5	2,593	359	13.8	113,436
Wool-washings, etc. ..	3	645	305	47	113,875
Total	82	126,580	32,366	...	$13 791,972

This table is interesting, not only as exhibiting the commercial aspects of the business, but as showing the diversity of the materials from which potash is being extracted. The sources are mainly old; and the methods, while improvement is rife, are in the main old also. While disposed to give ample credit to the young men of the Secretary's staff who may have had their attention called to this industry, I am unable to discover more than a single case in which their investigations, discoveries, or patents have been of significant utility. I much suspect that the honorable Secretary is occasionally given to obeying the precept, "magnify thine office".

The passing year has seen an expansion of potash manufacture, and, so far as we may judge from immature statistics, the output for 1918 will probably reach the equivalent of 55,000 tons of the oxide. The increase is mainly due to the activity of Californian producers, who have led the way in the development of the industry, and have put out by far the greater part of the domestic supply. California, in fact, is the greatest producer, and seems destined to remain so, in view of the immense supplies and great diversity of substances from which potash may be won.

Under the stimulus of war prices, and by the expenditure of fully $35,000,000, we have reached an annual production of 55,000 tons, or one-fifth the normal requirements. Should prices hold up there will undoubtedly be a large increase of production in 1919 and again in 1920, at which time, the Secretary informs us, the normal of 260,000 tons will be reached. But I see no reason for believing that any such quantity will be produced in either year. I doubt much if we reach 80,000 tons next year, and while prophesying in this as in other matters is dangerous, I venture to say that even if prices were to hold up we can scarcely extract more than 100,000 tons in the succeeding year, and we would be likely to fall far below it. This is on the assumption that prices will hold. However, all the probabilities are against the assumption, for, as the supply increases and the imperative demands of the chemical manufacturer and others are more fully met, the price is certain to fall, thereby destroying the strong incentive to increased production. Many of the smaller producers, who have all along regarded the business as a war-baby, and who are only able to carry it on when the margin is wide, will naturally cease production. These concerns have extemporized plants, for the most part gotten up cheaply and quickly for a temporary purpose, and are in no condition to fight to a finish, though for the present they are struggling with might and main to swell their output. Now that the War has reached a sudden end they feel generally that their circumstances are precarious, to say the least, and are unanimously hoping that Congress will take such action, in the form of a protective tariff, as will ensure a period of at least some profit. It is probable that the re-introduction of German potash would drive out of business fully four-fifths of the 80-odd producers in the preceding table, and, of course, would reduce the profits of the remainder to a very low figure. There are probably no more than four or five concerns in the whole country that could keep going at pre-war prices, and their situation would not be any too enviable. This is tantamount to saying that the greater part of the $35,000,000 lately invested in the industry will be practically lost if a strong protective tariff be not adopted at once. If free trade prevails foreign potash will be imported in vast quantities, the price will fall, our industry, built up with so much care and expenditure, will succumb, Germany will again be enriched with American money, and later, perhaps, the whole cycle of events will be repeated.

In common with other persons I have used the expression "normal supply of potash", as if it were only necessary to reach the pre-war basis of supply in order to satisfy commercial demands; but the term 'normal' has become meaningless in this connection. There was strictly no 'normal', since the demands of agriculture especially had been growing with the greatest rapidity; fertilizing the soil was becoming more and more a matter of course, and there were some important crops that could not be raised without manuring. Whereas in 1913, 200,000 tons of potassium oxide would have covered the requirements of agriculture, perhaps 300,000 might have been needed in 1918, through the growth of the fertilizing habit. But, as I have before remarked, the land has received no potash for four years, during which time the crops, such as they have been, have continued to draw upon the fast diminishing stores buried by nature in the ground. This draft must be made up some time, the sooner the better. It will require the addition of an immense quantity of potash, which must somehow be provided. Thus, for some years to come an extra amount will have to be supplied, in addition to the habitual amounts, as dictated by the apparent needs of the growing plants, thus calling for a vastly increased quantity in all. The time will surely come when the farmers will require, not 200,000 tons per year, but half a million tons or, more probably, twice that; and the demands, in the nature of things, will increase, the fertilizing habit having taken root to an amazing extent. The potash industry, then, is not a thing of today but of all time. It should therefore have the fostering care of the Government, and not be left to the chance devices of tariff-tinkerers as heretofore. I have said that in the past the authorities at Washington have acted adversely to the potash industry. I will cite cases to show as much. Some ten years since a well-directed effort was made by private parties to develop the potash deposits in Wyoming, and a good deal of money was spent by them in working out a process and in securing rights. Immediately attention had been attracted to their efforts the Government proceeded to withdraw the lands in question from location, and cutting them up into small tracts offered them for lease. Under these conditions the new company would have had to be at the expense of working out its process, apply it, build the necessary roads to make the deposit accessible, and undergo the pains and risks of a new enterprise—in fact, perform all the public services of the pioneer—at the end of which it would naturally find itself in competition with whomever might be incited to imitate its methods. This it naturally declined to do, and those promising sources of national wealth remain unworked. Again, when British capital became interested in the Searles Lake potash-soda deposit the attitude of Washington was far from friendly, and the regulations of the Land Office were invoked to hinder this most meritorious enterprise. It is most regrettable that these, and other concerns, were not encouraged to proceed, the effect of which would have been to relieve the great dearth of potash that has since been experienced. In view of the large amount of money required to establish a potash enterprise on a workable scale the governmental idea of leasing (not selling) small tracts of potash-bearing land is absurd. This policy does not, and cannot, harmonize with the views of those investors who alone have the means to carry out successfully the comprehensive plans necessary. Meantime the industry remains in a precarious position, the more so as the farmers, who will have a great deal to say in the matter of tariffs, clamor for cheap potash, regardless of its source. Under these circumstances it will be well for the industry to take up the question of extracting a supply of potash from minerals, such as feldspar, that contain other valuable materials besides, and obtain the potash concurrently with other saleable salts. This opens an avenue for more enduring enterprise, less affected by accident and by tariff changes.

HERBERT LANG.

Oakland, California, December 8.

Spitzbergen

The Editor:

Sir—Referring to the article in your issue of November 2 and the letter in your issue of December 21, I am glad to give you the following information.

The coal seams on the island of West Spitzbergen were first called to the attention of John M. Longyear, of Marquette, one of the subsequent backers of a mining enterprise there, in the summer of 1901, when he landed at Advent bay in the Ice fiord from a Hamburg-American liner then making an Arctic excursion.

In 1904 and 1905 the iron fields of Sydvaranger at the north tip of Norway, near the Russian line, were offered to Mr. Longyear and his associates, and he had engineers there for about one year and a half examining these deposits. Mr. Longyear's instructions to his engineers were to investigate the iron and at the same time to look at Spitzbergen for a possible source of coal. The results of the investigations were that the iron deposits were shown to be too low-grade to be of interest to Lake Superior mining people, but that the coalfields of West Spitzbergen, in the vicinity of Advent bay, were extensive, and the coal of excellent quality. The Americans dropped the iron-mining operations, but the coal-mining possibilities looked too good to be abandoned, so Frederick Ayer of Boston and Mr. Longyear formed the Arctic Coal Co. to open and equip coal mines on a fairly large scale.

The mines lay at a latitude of 79° 13′ N., a little over 700 miles from the North Pole, and 825 miles north of the north tip of Iceland. Iceland lies entirely south of the Arctic Circle. The mines were 1200 miles from the nearest railroad that could be of service to them, and 600 miles north of the island of Tromsö, which has been the headquarters of the Arctic Coal Co. in Norway.

As you know, Spitzbergen was uninhabited; although the area of the Spitzbergen archipelago is something like 32,000 square miles, it was supposed that no one could live there; of course, the Eskimo never inhabited this place. Occasionally whaling parties had been shipwrecked on the island and forced to winter there, and a few small hunting parties had spent the winter months trapping white and blue fox and polar bears and shooting reindeer and seals.

Spitzbergen is recognized by all the Great Powers as a *terra nullius* and is thus subject to the jurisdiction of no government or court; as no international commission had ever been appointed to govern it or deal with it, no form of government existed there, nor was any code of laws applicable.

The Americans staked four tracts of land known as the Cape Boheman, Sassen Bay, Green Harbor, and Advent Bay tracts, comprising about 600 square miles and covering the best of the coalfields; in fact, there is practically no mineable coal outside there areas. Maps and location notices showing areas and boundaries were sent to Washington and to the Foreign Offices of the Scandinavian and Russian Powers.

In addition to building docks, roads, railways, tramways, and a complete city with electric light and water system, the Arctic Coal Co. explored for coal on a big scale and eventually developed a large tonnage of semi-bituminous coal of Tertiary age. Our engineers' estimate of coal, all classes, assured, probable, and possible, in the one best seam under the portion of the area controlled by the American people, was about 700,000,000 tons. Run-of-mine averaged 3.8% ash, and the heat-value was over 14,400 B.t.u. The Arctic Coal Co. maintained a force of from two to six hundred men on the Island; many women spent the winters there at various times and more than a dozen children were born there during the American occupation. Dogs, horses, cows, pigs, and chickens were raised there, the pigs doing exceptionally well.

The problem of policing and administrating justice on the Island inhabited by so many men of the rougher type was solved by the Arctic Coal Co. by framing a simple code of laws, which code was largely written into the contract covering the employment of the individual by the company. It was found that one American to about fifty Scandinavians was the necessary proportion to maintain law and order. All men were transported to and from Norway on ships operated by the company, because no other regular means of transportation existed. Before leaving Norway the luggage and belongings of the employees were searched and all fire-arms, weapons, and liquor were confiscated and their possession or use forbidden on the Island according to the terms of the contract.

The only backing that the Americans in charge of the work had, was the questionable backing of the State Department at Washington. Its potency was never put to test, but every year a statement of the affairs and operations of the company was filed with the Secretary of State, and notices of such filing were sent to the Ministers of Foreign Affairs of Norway and Russia, through the American Ministers at Christiania and Petrograd. Under the guise of this slim protection the American flag was hoisted on this foreign soil and American rights were successfully maintained, although there were a few narrow escapes in this regard.

An attempt was made by the American owners to have what is known as the Guano Act, covering the protection of American interests in uninhabited islands, extended to read "Guano and other minerals and products." I believe this passed the Senate, but at Mr. Longyear's request was side-tracked in committee, as the State Department thought it would interfere with negotiations the Department was then carrying on with others of the Great Powers for recognition of American claims on the Island and possibly for the creation of an international commission to administer the affairs of the Island. The latter point was also a concession on the part of the Arctic Coal Co., as it was apparent that the affairs of the Island, the inhabitants, and the company could better be administered by the officials of the Arctic Coal Co. than by any international commission. Various meetings were held in Europe attended by representatives of Norway, Sweden, Denmark, Russia, and Germany, and various proposals for handling the Spitzbergen situation were made, all of which were rejected by the U. S. State Department at the request of the Arctic Coal Company.

In the summer of 1914 a meeting of representatives of eleven of the Great Powers was called in Christiania and this convention was in session all through July 1914. The Arctic Coal Co.'s interests were represented by officials of the company, by a representative of the State Department sent from Washington, by the American Minister in Norway, and by a diplomatic expert sent from France. Toward the end of July 1914 ten of the Great Powers (all except Russia) had verbally agreed to a recognition of the American claims and had assented to a scheme of government, and complete possession by the Arctic Coal Co. of land covered by original location notices. The entire matter would have been closed, settled, and signed by the end of the first week in August, if Emperor William had not mistakenly supposed that he could whip the world. On July 29 the various representatives at Christiania got telegrams from their respective governments instructing them to sign nothing and to come home quickly. So this whole thing will have to be gone over again, although the proceedings of the convention, as stenographically reported verbatim, have been printed and are in the archives at Washington and in the possession of the officials of the Arctic Coal Co. The proceedings, of course, were in the French language and this report is printed in French.

The European War made labor, supplies, and shipping-bottoms difficult to get, so it was decided to sell the property. In 1915 Scott Turner, the manager of the Arctic Coal Co., went to Petrograd to sell the mines to the Czar, in order to ensure a coal-supply reaching Alexandrovsk, the terminus of the railroad being built northward to secure a port free from ice all the year. He was to do business direct with the Czar and his Cabinet, but the German advance on Riga frightened these gentlemen away from Petrograd, and the highest he could reach in the political scale were a few dukes, so nothing resulted. He then went back to Christiania and met representatives of 42 of the largest banks in Norway, working through the Norwegian Prime Minister and the State Bank of Norway, and finally sold all the holdings of the Arctic Coal Co. to the Norwegians, the deal being closed in April 1916.

The new Norwegian company, called the Store Norske Kulcompani, has encountered many operating difficulties and in the two years that it has operated, in spite of great efforts and increased expenditures, it has succeeded in mining less than the normal eight-months' winter output under American administration. Labor has been troublesome and in 1917 Norwegian soldiers had to land at Advent Bay and ship the strikers back to Norway.

Houghton, Michigan, December 22. R. W. B.

Radium and Meso-Thorium

Radium luminous paint has been used in the War for a number of purposes, more particularly on the dials of instruments used in airplanes, so that these instruments can be read at night; for electric push-buttons, door numbers, and small images for shrines, etc. The paint is permanently luminous in the dark and contains from 0.1 to 0.25 milligrammes of radium element to 1 gramme of zinc sulphide. A luminous watch face usually has from 10 to 20 cents of radium on it. An excellent substitute for radium for certain purposes is meso-thorium. This is a radio-active element found in monazite sand and other thorium minerals. When first extracted it is not in a satisfactory condition for luminous paint, but must be allowed to 'ripen' for several months or even a year before it can be used. During this time the alpha radiation, which is required for luminous paint, becomes sufficiently strong. On the other hand, the beta and gamma radiation of meso-thorium grows rapidly and it can be used for medical purposes within a few days after preparation. Radium has a long life, half of it decaying in approximately 1600 years; meso-thorium, on the other hand, has a short life, 5 or 6 years being its useful life for luminous paint purposes. The price in the past has varied from 40 to 60% of that of radium, the comparison being on products of equal activity. For medical purposes, therefore, it cannot compete with radium as long as there is plenty of the latter; for luminous paint, to be used on objects that themselves have a short life, it is an excellent substitute for radium and will tend toward the saving of radium for medical purposes, according to the U. S. Bureau of Mines. The newspaper reports some time ago greatly exaggerated the future of meso-thorium.

Report of the Committee on Gold

RELIEF MEASURES PROPOSED BY GOLD-MINING INDUSTRY IN RESPONSES TO QUESTIONNAIRE

*The following nine items cover briefly the different measures of relief asked for by the gold-mining industry in response to the questionnaire sent out by the Committee:

1. Payment by the Government of a bonus on all the newly mined gold. This was qualified by some of the operators who asked that it apply only to primary gold mines, that is, to gold produced at mines where gold is the principal metal and not a by-product. The amount of bonus advocated ranges from $10 to $20 per ounce, $10 being the amount nearly always suggested.
2. Exemption from draft of necessary employees and the placing of labor for gold mines in the deferred class.
3. The assistance of the United States Employment Service in securing and maintaining a sufficient supply of labor.
4. Furnishing of supplies to gold mines by the Government at prices more nearly in keeping with pre-war figures.
5. The abolishment of the excess-profit tax; to this some added the demand that a larger allowance for depletion for ore extracted should be permitted by Treasury officials in computing tax-charges on profits.
6. Preferred classification for railroad freight, a reduction of the advance in freight-charges for supplies to gold mines and on ore shipments.
7. In California the activities of the Debris Commission are said to cause hardships at some mines.
8. Preferred classification for electric power.
9. Allowance of free export and sale to industry of new gold.

DISCUSSION OF PROPOSED RELIEF MEASURES

Gold miners believe that their industry is entitled to consideration of Government aid more than any other industry that may have suffered financially through conditions brought about by the War, because other industries can and do raise the prices of their goods while the purchasing power of gold is proportionately decreased. They urge that it is vital from an economic standpoint that the gold reserve be increased and the production of gold be maintained at approximately normal pre-war figures, or be stimulated beyond such amounts. If these premises be accepted, then it is necessary to find what measures can be best taken in order to accomplish these ends and to maintain as large a production of gold as is justifiable on economic grounds.

BONUS

Payment by the Government of a bonus on all newly mined gold, in order to stimulate the production of gold, has been strongly advocated by some miners and has been approved by some bankers. The amount suggested as allowable for this purpose as agreed upon at different conferences held by the representatives of the gold-mining industry is $10 per ounce. To what extent a bonus of $10 per ounce would increase the production of gold is questionable, but naturally a bonus would have a stimulating effect on the industry; it would cause renewed activity at operating mines, the re-opening of a number of mines that have recently closed, and would encourage the search for new mines, unless some restrictions were put in force. By way of qualifications, it has been suggested that the bonus apply:

1. Only at those mines at which gold is the principal metal.
2. Only to mines at present operating or which were operating up to the war period and were obliged to close on account of increasing costs.
3. Only on the amount of gold produced at a mine in excess of 1917 production.
4. That the bonus apply only during the war period and cease soon after the War ends.[1]

The following also is of interest in this connection:

"To stimulate the gold industry it would seem that the most practical relief to the producer would be for the Government to pay a fixed sum for every ounce of new gold sold to the Mint in addition to the price of $20.6718, at which liquidations are now made. While I cannot speak from the viewpoint of a mining man, I have received convincing statements from reliable sources which lead me to believe that such relief during the War, and perhaps prolonged for a year or two after peace, would be the best and most effective plan for maintaining and encouraging the production of gold in this country."[2]

It is obvious that with the restrictions mentioned the production of gold for the next two or three years would not be greatly increased over the amount produced for the year 1917. Assuming that the production of 1917 might be maintained for a few years by granting a bonus to new gold produced, a matter for consideration is to determine to what level would the production of gold fall without such a bonus. With the adjustment of economic conditions after peace is declared, and the return to industry of soldiers and laborers engaged in war-work, it is to be expected that the shortage of labor will be at least partly relieved. Wages may be expected to fall, but

---

*Part of the 'Report of the Committee appointed by the Secretary of the Interior to study the Gold Situation', October 30, 1918.

[1] Speech at meeting in Spokane, September 15, by George Greenwood, Old National Bank.

[2] John Clausen, vice-president, Crocker National Bank, San Francisco.

prices of supplies will probably continue at high level for some time, or until industry is readjusted to nearly normal conditions as compared to the pre-war period. With the return of conditions comparable to the pre-war period the gold situation would be automatically readjusted.

If scarcity of labor, high wages, and high costs of materials should continue for two years the annual production of gold in the United States may fall to $60,000,000 or less. On the assumption that a difference of $25,000,000 in the gold production would result from the payment of a bonus by the Government on new gold produced and that a bonus of $10 per ounce or approximately 50% of the present value of gold would need to be paid for all gold produced in order to obtain an increased output of $25,000,000, it is apparent that the cost of securing this $25,000,000 would be the normal cost of $25,000,000 plus a bonus, or approximately $42,500,000, on the total annual production of $85,000,000, making a total extra cost to the Government of $67,500,000, in order to increase the gold production $25,000,000. The suggestion that a bonus apply only to the amount of gold produced at a mine in excess of the production of that mine for 1917 would give preferential treatment to a few well-known mines, and would be of little benefit to the majority of gold mines in the United States. Sound business judgment would be against the bonus at this time.

In connection with the proposed bonus on gold it is interesting to note that the matter has had recent attention in South Africa and Australia and is now under discussion in England. The South African and Australian governments ruled against the payment of a bonus on gold.

In October 1918 the British Treasury appointed a strong commission representative of the leading financial interests of the empire to investigate into the effects of the War on gold production in the British empire. The personnel of this commission includes Lord Inchcape, chairman, Sir Thomas Elliott, Sir Charles Addis, and W. H. Goshen. William Frechville, mining engineer, advises on technical mining problems. This commission is making a sweeping inquiry into the conditions at gold mines and possible measures of relief. Especial attention is being given to the desirability of granting the demands of the gold producers for a revision of the selling price of their products to compensate for the increase in cost of labor and supplies, to means of encouraging the mining of low-grade ores, and of stimulating the production of gold in general.

The producers of South Africa and Australia have requested the Treasury to contract for all gold mined by them for a term of ten years at a price calculated to ensure maximum production. The seriousness of the situation in those countries is reflected in a statement by A. E. Waller, chairman of the Transvaal Chamber of Mines, to the effect that out of 46 companies operating in the Transvaal, 6 were running at a loss and 15 were barely paying expenses. Confirmation of this statement is given by Sir Lionel Phillips, who says, according to an article published in September 1918, that a large number of the mines on the Rand will have to shut down unless some relief can be obtained.

EXEMPTION FROM MILITARY SERVICE

The exemption from draft of necessary employees and the placing of labor for gold mines in the deferred class, has been granted to a certain extent by recent rulings of the War Department; gold mining has been declared an essential industry and the matter is one for local draft-boards to decide whether individual men are necessary to the industry.

ASSISTANCE OF UNITED STATES EMPLOYMENT SERVICE

The assistance of the United States Employment Service in securing and maintaining a sufficient labor supply is asked. The United States Employment Service can, if authorized by proper Government action, assist the gold miners in the returning to the mines experienced men who have gone into other war industries for patriotic or other reasons. It can also transfer men now employed in less essential industries. Some advertising could properly be undertaken by the gold mines to impress upon labor that gold mining is regarded as an essential war industry and that men necessary to that industry are subject to deferred classification by the local draft-boards. The Director of the Bureau of Mines, as certifying officer to the War Department on industrial furloughs for metal mining and metallurgical industries, can aid greatly in the rehabilitation of the labor-supply of the gold mines. Negotiations are now under way whereby men returned from France for recuperation may be used to some extent in industry where their health would be benefited during the period of their recuperation; this would release more able-bodied men for the more arduous tasks, such as mining.

Allotment of labor to mines must be guided by intimate knowledge of the gold mines requesting assistance, otherwise labor might be wasted on unimportant projects. Because of this fact, and the fact that wages are higher in other industries, and on account of the isolated location of many of the gold mines, it is difficult for the United States Employment Service to recruit labor for gold mines. Relief through the War Department would not be hampered by these objections since no man is to be furloughed unless willing. The men would be properly cared for and paid at some wage fixed by the Government. It is the opinion of this committee that the labor situation is the most serious problem confronting the gold miner and that this should be given consideration by the proper Government agency. It is only through Government action as above outlined or through the importation of laborers as discussed elsewhere, that the labor situation during the War and the readjustment period after the War can be greatly improved.

Furnishing supplies to gold miners by the Government at prices more nearly comparable with pre-war figures than now paid would cause great dissatisfaction at mines producing other metals and in other important industries, and it is not considered feasible. A central purchasing agency for buying supplies would give some relief to the small miner as suggested elsewhere.

Abolishment of Taxes

Excess profits were imposed at few gold mines in 1917. The total amount paid as reported by mines answering questionnaires was under $500,000, though some disputes for additional amounts are still unsettled between companies and tax officials. Proper allowances should be given mines for depreciation of plant and depletion of ore by tax officials; much remains to be done to educate tax officials to appreciation of the proper rate of such allowances. Should a small group of miners or prospectors form a small company, of say, $10,000 to $100,000 capital, and expend the entire capital but strike it rich and take out as net profit an amount equal or more than the capital put in, in such case they would be obliged to turn over to the Government nearly half of their profits. Under such conditions the search for new gold deposits is greatly discouraged by the tax. The elimination of all excess-profit taxes on gold mining and the encouraging of maximum outputs might in reality bring in greater revenue to the Government than the tax, for larger dividends paid to shareholders would mean greater revenue from individuals.

Preferred Classification for Freight

Gold mining has been declared an essential industry and given a Class C rating. As such it is entitled to receive priority orders for freight, etc. The reduction of freight-charges on ore shipments where there has been a recent advance, as in Colorado, is a measure that should be allowed. The cost of freight on shipments of materials to gold mines is but a small part of the total cost of mining.

Debris Commission (California)

This applies to California only. The Committee has received many general statements to the effect that the Commission has been especially active and that their orders for expensive construction are causing great hardship at some of the lode mines at this time, when costs are high and profits from gold mining are abnormally low.

Preferred Classification for Electric Power

In California there was a shortage of power caused by lack of mains and the action of the State Power Administration in discriminating against gold-dredging caused general dissatisfaction. It was rightly felt that other forms of power consumption, such as amusements, excess lighting facilities, etc., could be curtailed with far less loss to industry. The gold mines should have a high-class rating with regard to power consumption, and power should be curtailed only when there is great necessity for such action.

Free Export and Sale of Gold

Gold has been sold in England at 115 shillings per ounce as against 85 shillings per ounce paid by the Bank of England for coinage purposes and the Government found it necessary to prohibit the melting of coins. Gold, under present conditions, could be also sold at a premium in this country for use in industrial arts, and if a free sale of gold were now permitted a certain amount could be absorbed at a considerable premium. A study of the market for gold shows that for the last four years about 45 millions per annum, approximateley one-half the amount produced in the United States, went into manufactures. Dentists use a large part of this gold and could pay a higher price for it, as could also jewelers. The amount of old material, jewelry, etc., that is consumed in manufactures in the United States has been approximately $8,000,000 worth per annum, and new gold to the value of approximately 37 millions per annum is consumed in this manner. The amount that could be absorbed at a premium is not known and would depend to some extent upon psychological conditions. If it were thought that the price of gold would go higher, quantities would be bought for speculative purposes, unless restrictions were imposed. The following is of interest in regard to the sale of gold in the open market:

"It seems to have been overlooked by many that the Mint price for gold (85 shillings, or $20.67) is quite different from the market-value or exchange-value of the metal. Gold, as a commodity, has had this last month in England a value some 35% in excess of the Mint price; the 'Annalist' tells us that minted coins have been at a high premium because of profiteering by labor. Workers are receiving wages higher than ever before in their experience and there is a demand for jewelry which exhausts the supply of gold, the commodity. An ounce of gold in a jeweler's hands will make four rings, for which he will get at least $30; in consequence, the market-price of gold, in those countries in which gold has been commandeered, is nearly 50% above the Mint price. This is the fact that has led Sir Lionel Phillips and his committee to approach the British government for permission to sell the gold produced by their mines in the 'open market', that is, sell it as a commodity."[3]

Further Suggestions

In addition to the matter discussed above it is the opinion of this Committee that gold should be placed under authority of the War Materials Administrator. In that way Government assistance can be given gold mines where desirable as provided for in the War Minerals bill for the other important metals included therein.

It is also suggested that a thorough study be made of the gold-mining industry with a view to improving mining and metallurgical conditions and also to go thoroughly into the labor situation.

It seems feasible for the Government, through the Bureau of Mines, to assist in improving methods of mining and metallurgy, particularly the latter, in the treatment of complex ores and those of low gold-content. A number of technical problems requiring solution may be mentioned. Among these are the regeneration of cyanide solution, the treatment of complex and refractory ores, the cheaper production of cyanide, and the recovery of by-products from tailings. The practical solution of a few of these problems might easily bridge the gap between failure and success in the operation of low-grade properties. That particular field of work has been almost untouched by the Government and the present action may be particularly opportune for planning adequate work in that field.

---

[3] Bulletin, Canadian Mining Institute, October 1918.

Efforts should also be made to extend co-operative buying of supplies by mining companies. A central agency could be established in each State or district for co-operating with those elsewhere and thus reduce costs. This would ensure not only the best prices, but the greatest consideration from firms dealing in mining supplies. It would naturally prove more beneficial to the smaller mines that do not maintain purchasing departments, and would to some extent ensure the larger mines better prices than they now obtain.

Besides securing better prices great benefits would result from the distribution of knowledge, based on the experience of the larger users, as to the most satisfactory material to use for different kinds of work. Information of this kind could be properly discussed in a report on the gold mining industry by the Bureau of Mines.

CONCLUSION

There is no doubt that the output of the gold mines of the United States is seriously falling off, and under present economic conditions still smaller returns must be looked for in the future. The cause of the decrease is not wholly due to war conditions, but also to the fact that some of the most productive lode and placer mining deposits are showing exhaustion without equivalent new discoveries taking their places.

War conditions are a serious burden and bear with special weight on the gold-mining industry, in that as the prices of other commodities advance the purchasing power of gold necessarily decreases. The prohibition of exports of gold and the limitation of the circulation and internal trade in gold are injurious to the gold miner and justly entitle him to special consideration.

The different aids that have been suggested are outlined in detail. The granting of a bonus, or bounty, has the greatest advocacy from the mine operators, but seemingly such a measure would net the Government only a very small percentage of increase in its present great gold reserve, and then only at great cost. The principle of the bonus appears to be in general economically unsound and its application might result in serious abuses.

As a result of the War the United States has been transformed from a debitor nation into the great creditor nation of the world, and has the greatest gold reserve and best gold cover for its paper currency. Its credit, while undoubtedly the soundest, is still probably in need of gold backing for the reconstruction period, if this country is to make use of its advantage as a world power in trade. It must be remembered that we control only about one-fifth of the current output of the gold mines of the world and peace conditions may not prove so favorable for our holding our premiership as a creditor nation. The Liberty Loan bonds, with pledges for redemption on a gold basis, may amount to several times the total gold reserves of the world, and some provision must be made from time to time to pay at least a portion of them in gold as they fall due at the option of the holders.

The various measures of relief asked for by the gold-mining industry, with the exception of No. 1, 4, and 6, could easily be granted by executive action without additional legislation. As the profit of a gold mine, no matter how large, cannot be ascribed to war conditions, and, in fact, is seriously handicapped on that account, the remission of this tax is a logical and just demand, and might well be considered. The free export and sale of new gold should be permitted not only because it will help the miner but also because it gives freedom of movement, thus preventing inflation.

Intelligent relief to the most struggling and deserving of the gold mines might be obtained by amending the War Minerals Act to include gold mining and at the same time voting an appropriation that would be at the disposal of the Administrator to encourage gold discovery and aiding in the re-opening of mines shut down on account of adverse economic conditions. This we have pleasure in recommending.

Comparative Statement Showing Details of Operations at Most Important Gold Mines in the United States, Grouped by States

Dredging Operations Combined in One Group

Figures for 1918 not given by some mines reporting for previous years

Brief on the Status of the Chrome Industry

PREPARED BY COURTENAY DE KALB

Elements of the Case. For war-equipment the Government required supplies that could not be produced without chrome.

The need of ships for military purposes cut off the supplies from abroad on which this country previously had depended.

The contractors under obligation to use chrome in their operations for supplying war-material to the Government demanded Government co-operation in securing a domestic output in lieu of imported chrome.

The Government, through its Departments and War-Boards, responded by issuing circulars, bulletins, and letters urging the people to search for, to mine, and to deliver chrome ore.

It introduced into Congress a bill to protect all parties concerned, to-wit: to protect the producers by a remunerative market; to protect the consumers by a domestic supply; and to protect the Government in an adequate supply of chrome-ore, ferro-chrome, and chemicals prepared from chrome.

It undertook, until the bill should be passed, to protect the miners by embargoes; to protect the contractors by import licenses for supplementing any deficiencies in domestic deliveries; to protect the Government by insisting that mine-owners should operate their properties, or permit them to be operated, in order to produce chrome.

Importations amounting to 90,456 tons, made to a large extent in defiance of the regulations of the Government, broke the market.

The miners, most of whom are men of small means, will be ruined unless relief be extended immediately. Their aggregate losses will be not less than $1,000,000.

The Pacific Coast Chrome Producers Association demands that relief be extended through the Minerals Control Act, or by such other means as can be made effective at once, in order to save the producer from ruin.

They insist that a moral responsibility exists which must be fulfilled in order to uphold the honor of the Government, and they petition the Government to take instant measures in their behalf.

Pre-War Conditions. The average consumption formerly was about 45,000 long tons per annum. Practically the whole of this was imported.

The consumption has been increasing with the normal progress of the metal industry; it had risen to 65,000 tons in the year 1913.

War Conditions. Consumption, as indicated by domestic production and imports, rapidly augmented.

Total Chrome Available

	Long tons
1914	75,277
1915	79,736
1916	162,980
1917	115,788

Consumption in 1918, as determined by the U. S. Geological Survey, amounts to 104,000 tons. The decrease in 1918 was due to restrictions upon consumption in fear of shortage.

A summary of the situation is given in a memorandum prepared for Pope Yeatman, dated October 26, 1918, attached hereto as Exhibit A.

Domestic Output of Chromite

Year	Long tons	Average price per ton at shipping point
1908	359	$20.14
1909	598	13.88
1910	205	13.31
1911	120	13.58
1912	201	13.70
1913	255	11.19
1914	591	14.75
1915	3,281	14.50
1916	47,035	17.00
1917	43,725	....
1918	60,000	....

The foregoing table shows that an increased use in 1908 stimulated the price and the production. The response to a price of $20 per ton that year exceeded the demand, and the price promptly fell to $13, after which production almost ceased for four years. The consumption had so far increased by 1913 as to again stimulate domestic production, with a slight gain in price. The demand for war-uses in Europe acted as a great stimulant to chrome mining in this country.

Properties near transportation facilities were thus brought into production. Each increase in price made it possible to develop properties more remote from the railroad. At a price of about 50 cents per unit, for 40% ore, a production of about 40,000 tons yearly was made feasible. This fact was recognized by the consumers, and it was on their suggestion to Government officials that an increase of production was attempted by raising the price. This meant that the cost of long local hauls to the railroad could be overcome. The price was raised from 85c. to $1.25 per unit for 38% ore by the chief consumer, being equivalent to $47.50 per ton at the shipping-point. This extended the radius of operations to a distance of about 70 miles from the railroad, the local haul absorbing as much as $25 or more of this price.

The result was to increase the number of domestic chrome miners from a few who had mines near the railroad to more than 450 in 1918. Of these, 365 were in California, 59 in Oregon, and the remainder scattered through other States. Of the above number, approximately 200 shipped ore. The majority were making ready for production by developing their properties, establishing camps, and building roads when the armistice was signed.

Official Estimates of Domestic Production. The U. S. Geological Survey's estimate, made in May 1918, indicated a probable domestic output of 50,000 tons for the year. This was a conservative estimate as shown by the fact that the actual output reached 65,000 tons, being only 15,000 tons in excess of the forecast. The Survey evidently had not anticipated such a great increase in price as was made by the California Chrome Co. This resulted in preparations for production that would have brought approximately 100,000 tons into the market in 1919.

In making the forecast for supplying the consumers it was assumed that 140,000 tons would be needed in 1918. The officials of the Government cut this down to 130,000 tons. As domestic production grew, and as shipping space became more urgently needed for military purposes, importations were further restricted, and an absolute embargo was placed against imports by sea, effective on June 15, 1918.

Reduction in the consumption, through severe economy in the use of chromite, coupled with large importations, to a considerable extent in violation of the embargo, swamped the market. Large tonnages were brought in over the embargo, and much of this reached American ports unannounced and without license. This can be confirmed by C. K. Leith.

Illustrative of the activities of the importers, who were importing for the consumers, the following table is important.

Chromite Imports

Origin	Sept 1918 tons	Oct 1918 tons
Canada	2,064	3,070
Australia (originating in New Caledonia)	2,778	64
French Oceania (New Caledonia)	748	....
Brazil	534	....
Cuba	2,170	2,500
Portuguese Africa	5,000	....
British Guiana	....	523
British South Africa	....	521
Total	13,834	7,120

The total imports, according to estimates of the Geological Survey, will amount to 90,456 tons, based on 50% ore, for the year 1918.

For a further review of these conditions, and for confirmation of the effect of raising the price, see pages 39 and 40 of the report on 'Chromite', by J. S. Diller, constituting part of the 'Mineral Resources' for the year 1918, attached hereto as Exhibit B. The circumstances under which the price was raised are therein stated.

One of the advertisements of the California Chrome Co. is also attached as Exhibit C.

Government Stimulation of Chrome Mining. The great response to the needs of the country for more chrome ore was the direct result of the insistent call of various Government Departments and War Boards through circulars and statements issued to the people and the press. Examples of these urgent requests for patriotic effort in providing these minerals are contained in Exhibit D. This has nine items, which constitute but a few of the many that were sent out. Not only were the people reached in this way, but the Committee on Public Information issued circulars urging the production of chrome and manganese.

Special attention is directed to the circular from the Committee on Mineral Imports and Exports of the U. S. Shipping Board, dated May 4, 1918, shown in Exhibit D. In this the people are reminded that the War Minerals Bill, to control the mineral industries, is pending in Congress, but they are urged not to wait until every detail is settled before beginning operations, and they are assured that it is a "safe assumption that the absolutely necessary things will be done in time," this referring to Government protection.

Equally important is the letter from the Chemical and Explosives Section of the War Industries Board, dated March 4, 1918, also appearing in Exhibit D. This announces a general policy of the War Industry Board, as follows: "It is the desire and intention of the War Industries Board that all properties containing valuable deposits of chromite, that can be reasonably operated, shall be developed at an early date, and we are willing that properties should be leased which are of value to the country, and should neither be operated by the leasor or leased by him to another operator."

Attitude of the Chrome Miners. There was hesitancy on the part of many miners to open up mines of chromite until they had received further assurances as to the needs of the Government and as to a dependable price, since chrome mining was recognized as a particularly speculative operation. They were not seeking an extremely high price. The prevalent feeling is summed up in the testimony by Pope Yeatman at the hearings before the Committee on Mines and Mining, U. S. States Senate, 65th Congress, 2nd Session, on the Bill H. R. 11259, on May 10 (see pages 200 and 201):

"The Chairman. Do you feel that it is necessary to provide for price fixing in this bill?

"Mr. Yeatman. I do; yes, sir.

"The Chairman. Why?

"Mr. Yeatman. I do, for this reason, that in every conference that we have ever had the producers have always asked for that, and the reason they have asked for price fixing has been that they wanted to know, they wanted to feel that the business was more or less stabilized; they wanted to feel that if they started in new—as many of them would have to do—they were going to be able to count on some regular price, and such a price as would be made regular by the Government fixing it.

"Senator Shafroth. Does not that apply, however, to the fixing of a minimum price only?

"Mr. Yeatman. Not necessarily, no; even if it is a maximum price. If it is a maximum price, it is a price beyond which they cannot go, but at the same time they feel that something is fixed. They would all prefer a minimum price, but many of them feel that even with a maximum price a great benefit would result."

It must be emphasized that a great part of the injury done to the chrome miners came from an unwise establishment of a price by a private corporation, the California Chrome Co., acting with the consent of the Government, whereby an unjustifiably high price was applied as a minimum, without being regularly fixed and made permanent by the Price-Fixing Board. Accordingly the price did not affect the entire market, but only the domestic end, and the consumers succeeded in bringing in ore at lower rates while the miners in this country were left without protection.

Restrictions imposed upon the refractories companies limited their freedom to buy ores that they otherwise would have accepted. Originally they were restricted to ore of 38% grade. This was changed later to 43%, and was held at that figure until November 1. That was long after the market had been broken by large importations. As late as September 25, A. A. Fowler (secretary of the sub-committee of the Ferro Alloys Committee of the American Iron & Steel Institute, co-ordinated with the War Industries Board for control of the non-ferrous alloys), stated that the restrictions had not been removed, but that, in cases of error, when ore received proved to exceed the 43% limit, an adjustment would be allowed "if there were no valid reasons to the contrary."

That these restrictions were continued to the detriment of the domestic chrome producers is shown by the admission in the circular letter of the American Iron & Steel Institute of November 1, signed by James T. McCleary, that, while the steel-makers had not permitted the reduced consumption of chrome ore to interfere seriously with the quality or output of steel, "we note, however, in some of the replies, that a reduced life of the furnaces resulted from cutting down the use of chrome ore, and that indirectly some loss of production has occurred. Also that, in some cases, the use of magnesite as a substitute has increased costs."

Government Responsibility. Provision of the war material covered by the output of the war minerals, divides into two parts:

1. The Producers. These were scattered, and to a large extent not personally known. With these a blanket-order for output was the only possible means of securing a supply.

2. The Consumers. These were known in advance, and contracts were made, or were being made, for products dependent upon the supplies derived from the producers. Prices were based on the cost of raw material, with a large differential, especially in the case of ferrochrome, so that the market for raw material might vary within wide limits without extinguishing the manufacturers' profit.

Production was undertaken for the benefit of those known to the Government and with whom it was possible to directly make contracts.

Production was made in this country at the urgent request of consumers, through the Government acting for them, in order that the contracts might not fail to be fulfilled.

Production was urged by the Government through its various Departments, War Boards, the Shipping Board, and the Committee on Public Information.

Producers were urged not to wait for confirmation of guarantees, but to begin production at once, while the War Minerals Bill was pending for definite control of production and market. It was also announced officially as the intention of the War Industries Board that properties would not be allowed to remain unexploited for the public welfare, and producers were warned of this purpose in cases where it was thought that they were hesitating to produce.

For confirmation of the above, see Exhibit D, giving quotations from official Government circulars, bulletins, and letters, urging energetic production of chrome and other war minerals, containing ten items.

The Analogy Between Blanket Orders of this kind and orders by word of mouth and by telephone, but without formal written contract, is such as to put them in the same class. In the case of the latter verbal orders, agreed prices were part of the transactions, while the price for war minerals is a matter of adjustment under the operation of the Minerals Control Act, if the Act be used for the protection of the war-minerals industry. The War Department has taken steps to protect those who were operating under verbal orders.

How the Government Carried Out Its Obligations. The chrome industry was intended to be protected, until Congressional action could be taken, by means of an embargo against imports. This was supplemented by licenses for importation as a means of protecting the consumer, so as to give him surety of obtaining raw materials from abroad, so far as the circumstances of shipping-space permitted. By a combination of embargo to protect the producer, and of licenses to protect the consumer, a fair and equitable arrangement was aimed at. Important official rulings in regard to these matters are annexed hereto as Exhibit E, consisting of eight items.

Violation of these rulings by importers resulted in further accumulation of stocks of chrome ore in this country. Part of these imports were made under sanction of the Ship Control Committee of the Shipping Board of New York, which is said to have exceeded its authority. This, however, is not the cause of the bulk of the unlicensed importations.

Acceptance by Government officials of the proposal of consumers to raise the price of chrome 40c. per unit, as a means for stimulation of the production, has done great damage to the producers by leading them to develop properties remote from transportation lines, and to erect concentration works to treat low-grade ores, all of which would never have been done except for such stimulation, and except it had been understood that the chief consumer was acting on behalf of the Government. The suggestion of Mr. Yeatman should have been followed, and the whole market controlled by a fixed Government price. Failure to do this has proved disastrous.

Continued Inducement by Government Officials to produce chrome after the market had gone wrong, and when it was known to Government officials that large stocks had been accumulated and thereby had made the market weak, led to persistence of production, and to a continued outlay in preparation therefore, which otherwise would have been stopped. The public should have been informed officially to cease development and production rather than encouraged to believe that "it is the present intention of the War Industries Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to the rate of 1918." On the same day (September 28, 1918) the same official, in charge of these matters for the War Industries Board, sent out communications, in one case giving doubtful encouragement to producers, and holding out the prospect of being able to dispose of output for producers; in the second case giving positive encouragement to believe that a market would be available for the remainder of the year at the California Chrome Co.'s schedule and that the output for the first half of 1919 would be absorbed by the consumers; and in the third case announcing that the market had been weakened by large accumulations of stocks in the hands of consumers, and he further pointed out that the consumption by the makers of ferro-chrome and by the chemical trade had declined one-third, although he had advised other producers on the same day that the chemical trade was a likely buyer. These are examples of communications that have done serious damage to producers by encouraging them to continue, because they believed that information from the Government boards could be relied upon. This group of communications constitutes Exhibit F.

The list of chrome buyers and the California Chrome Co.'s schedule of prices, which is at least semi-official, is given in Exhibit G. Recognition of the attitude of the Government toward this schedule will be found in the Geological Survey's bulletin, constituting Exhibit B, pp. 39 and 40.

Further Encouragement to Produce was given by the same party who wrote the communications in Exhibit F, in a communication to Senator Chamberlain, on the strength of which that gentleman committed himself to constituents (A. E. Reames and George Putnam, Medford, Oregon) by wire, dated September 24, 1918, quoting Hugh W. Sanford as his authority, as follows: "New survey chromite situation indicates tonnage domestic chromite produced balance this year can be sold at average price prevailing this summer."

As late as October 2, after having acknowledged in one letter that stocks were large and consumption greatly reduced, the same party sent a letter of encouragement for chrome production to Representative N. J. Sinnott of Oregon, causing him to mislead his constitutents and allow them to proceed with expenditures that would not have been made had the facts been correctly represented.

See copy of letter to Mr. Sinnott, Exhibit H.

Control of Production and Market for the Government was vested primarily in a committee of the American Iron & Steel Institute, known as the Ferro-Alloys Committee, acting officially for the War Industries Board, in conjunction with the Chemical Division, Ferro-Alloys Section, of the War Industries Board, Hugh W. Sanford, chief. The Ferro Alloys Committee consisted of the following persons:

J. A. Farrell, chairman, U. S. Steel Corporation.
E. F. Price, Electro-Metallurgical Co.
F. W. White, Mutual Chemical Co.
E. J. Lavino, broker and dealer in chrome, etc.
Frank Samuel, broker and dealer in chrome, etc.
C. A. Buck, Bethlehem Steel Corporation.
E. A. S. Clarke, Lackawana Steel Co.
A. D. Ledoux, Rogers, Brown & Co.
D. G. Kerr, Carnegie Steel Co.

H. C. Dubois was also for a time on the Chemical Division, Ferro-Alloys Section, of the War Industries Board. He was an employee of E. J. Lavino & Co. Mr. Sanford was of the firm of Sanford & Day of Knoxville, Tennessee, and a consumer of ferro-chrome, which is produced by the Electro-Metallurgical Company.

Not a single producer nor representative of the producers was on any of the committees in charge of this matter.

A group of producers prepared a memorandum regarding this phase of the case, which has the merit of showing how it appears to the man in the field, and for this reason is valuable as presenting a point of view that prevails widely among producers. Whether wholly capable of substantiation or not, it reveals a situation that is unfortunate, and which the Government can remedy only by wise and prompt action for the future welfare of the wronged producers, in compensation for the errors and injuries of the past. This opinion of producers constitutes Exhibit I.

Outlook for a Chrome Industry. The development undertaken through the inspiration of the Government has shown that the domestic mines can supply the total output needed in this country. Much of the chrome discovered is of high grade, and still larger deposits of low-grade ores have been revealed. These can be concentrated in increasing quantity if the industry persists. The product of the concentration mills will be peculiarly adapted to use by the ferro-chrome makers and in the chemical trade. The refractories makers find some difficulties with concentrates, but there is a sufficiency of raw ore available that is suitable for their needs.

There is no need of reliance upon foreign resources if our domestic mines are sustained. They will employ profitably several millions of capital.

The industry will give employment to large numbers of workers, the aggregate needed for the war-minerals, if sustained as an American industry, running into the thousands, and resulting in a distribution of wages earned amounting to many millions of dollars annually.

If not sustained as an American industry our chrome supply will depend upon the output of low-priced labor in Oceania, Brazil, Cuba, and Africa, causing a loss of opportunity to American workmen who need the advantage of every source of profitable employment during this period of reconstruction.

Remedies for the Injured Chrome Miners. Three methods seem to be advisable:

1. To use the War Minerals Act (Public 220). It was passed, as shown, to cover the blanket-orders given, and to better regulate production, in the interest of the Government, that depended upon the fulfilment of its contracts with the consumers.

It is the opinion of eminent attorneys that it can be applied if construed according to the strict wording of the statute, considering that we are technically at war until a treaty of peace is proclaimed.

The title of the Act indicates its purpose, and the following abstract from a letter written by the Director of the U. S. Geological Survey cites important court decisions regarding the significance of the title of a statute:

The excerpt is from a letter of Director George Otis Smith, U. S. G. C., to Hugh W. Sanford, October 29, 1918, as follows: "I realize your legal forebodings, but common sense is one mental function to be used in construing law. You and I understand pretty well the purpose of the mineral control law, and I know the temper of Congress in passing it. The minerals listed, whose production is to be encouraged, are 'those which have formerly been largely imported' and now needed as war necessaries. My quotation from the title of the Act is justified by the well recognized rules of construction that "where the mind labors to discover the design of the legislature, it siezes everything from which aid can be derived; and in such case the title claims a degree of notice, and will have its due share of consideration.' (United States v. Fisher), and that 'The intention of the lawmaker is the law. . . . Where doubt exists as to the meaning of a statute the title may be looked to for aid in its construction.' (Smythe v. Fiske)."

Director Smith adds: "The need of ensuring the new producer that his prospective output if not at once needed would be purchased by the Government is part and parcel of the need of ensuring the nation against a prospective inadequacy of supply."

It is admitted that, as regards chrome, manganese, and potash, there is no shortage of supply if we continue to draw upon foreign resources. The manganese market has dropped out altogether, as has the market for chrome, and the potash producers cannot sell their stocks on hand because the consumers are so confident of being able to secure cheaper supplies from Germany that they will not buy. In none of these cases, however, is there a sufficient domestic supply available without definitely protecting the producer, so that he may continue to develop his properties and prepare for marketing his output.

These industries are vital to the security of the country in the event of trouble that should again cut off or threaten our access to foreign sources of supply.

Application of the Minerals Act would therefore fulfil the obligation of the Government toward those to whom it gave blanket-orders to produce ore; and it would also perform a duty to the whole nation in keeping it in a strong position so that it will be less assailable from a military standpoint or by intimidation through diplomatic negotiations. Difficulties of the latter sort are matters of recent history in connection with our supply of nitrates.

2. It has also been suggested that a bounty might be paid, but it is recognized that this principle is not popular with the American people.

3. The last resort is Congressional relief. If this were asked it should be taken speedily, as many of the chrome miners are operating on leases that will expire unless work persists, and they are so encumbered with debts at the banks that they will be ruined and unable to resume operations unless relief is given at a very early date.

The chrome producers ask, if none of these be the proper remedy, how does the Government propose to proceed for their relief? They understand that the Government has repeatedly confirmed its sense of responsibility involved. They are ready to co-operate with the Government in effecting a practical solution of the problem that will become operative in time to save those who are now threatened with early ruin as a result of their entry into the production of chrome at the request of the Government.

Note. Later figures show that importations under license since July 1, 1918, have amounted to 45,360 tons, of which 13,000 tons came from New Caledonia. The total illicit entries are said to have been about 7000 tons, this figure being subject to revision. The licenses, made for the protection of consumers, allowed entry of far more ore than events prove to have been necessary, and they have worked great harm to the producers. As late as the middle of October the War Boards were figuring on having to meet demands from consumers for 1919 at the estimated rate of consumption for 1918, and they had allowed in their forecast for importing about 50,000 tons from Canada, Cuba, and Brazil, keeping in mind that consumers have always insisted on having reserve stocks, as a margin of safety, to the extent of 60,000 tons.

The responsibility of the Government is thus shown to be even greater than would appear from other statements in this brief, because it was encouraging further production for the national security long after the stocks of chrome in the hands of consumers in this country were so large as to weaken and break the market, which fact was known to the officials of the Government.

A WIRE HOISTING-CABLE at the Canadian Western Fuel Co.'s mine, B. C., snapped on September 10 last, resulting in the death of 16 miners. A careful investigation was made at the mine, also tests at McGill University, Montreal. According to W. Fleet Robertson, Provincial mineralogist, the failure of the rope was entirely due to the oxidizing of the wires, chiefly internally, caused by apparent lack of internal lubrication, leaving the wires exposed to the action of a more than normally corrosive water and a humid atmosphere. The internal hemp core, which under a sufficiently effective lubricating system would serve as a reservoir of oil to keep the wires oiled and protected from corrosion, not being supplied with oil, became a reservoir of moisture and so hastened corrosion of the wires. Apropos of this, a recent test of a 1¼-in. cable from a Sudbury, Ontario, mine was made at McGill. It broke at 58,600 lb., whereas the new rope had a breaking strength of 128,000 lb. Internal corrosion was the cause, although the wires showed little deterioration externally. At some mines oil is allowed to drop on the ropes from a feeder above the sheaves.

A Non-Drowning Pump-Station

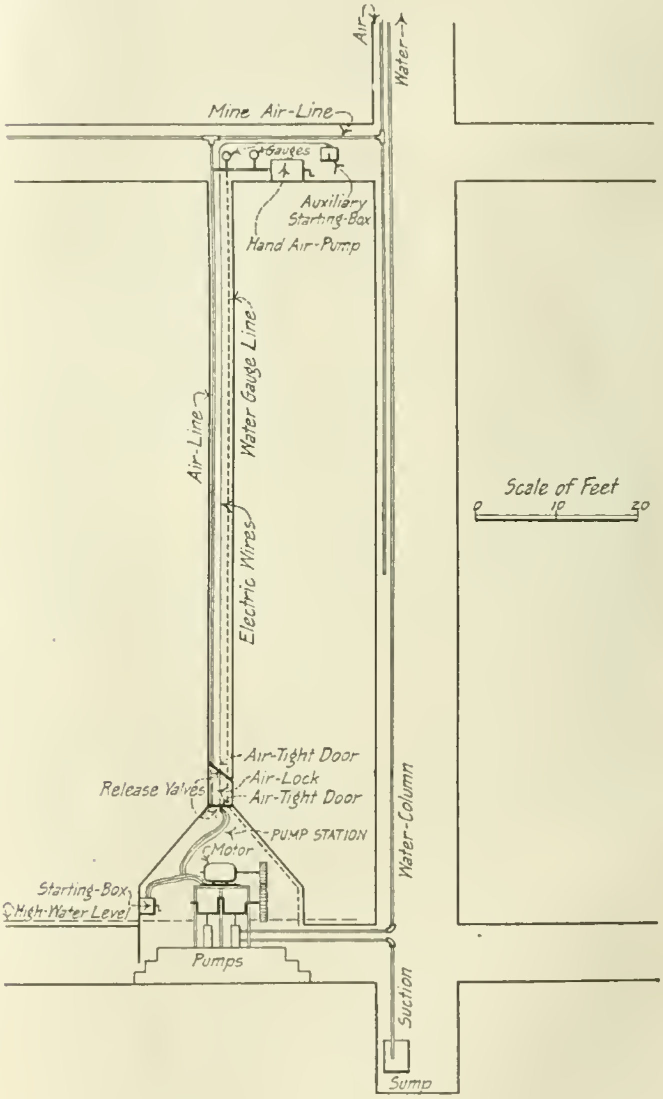
By C. ERB WUENCH

During the unwatering operations at the Yak mine, in the Leadville district, it was noticed that in the backs of several old stopes air-pockets had been formed. Even though the water had risen considerably above the highest points in these stopes, the small cavities in the back were entirely unwetted. Such air-pockets have saved the lives of miners. This suggested to me the possibility of designing underground pumping-stations utilizing the principle of the hydraulic 'diving-bell'.

In the history of a great many mines that have been drowned it is on record that if only an hour or two more time could have been had in which to make the necessary repairs thousands of dollars of expense in unwatering might have been saved. In the Yak mine, owing to a sudden inflow of acid water that corroded the pumps of an intermediate pumping-station and caused an excessive flow to be handled by the pumps at the bottom, the motors burnt out. The sudden flow of acid water was due to the Moyer mine, an adjoining property, having been abandoned. There being no underground connection at depth the water, which was formerly handled by the Moyer pumps, backed up through the old stopes and took into solution the sulphates of iron and zinc formed by the exposure of sulphides to oxidation for a number of years, and then the waters charged with these sulphates found their way into the Yak mine and corroded the intermediate pumps.

By referring to the accompanying sketch, the general design of this style of pumping-station can be readily comprehended. The station is cut out so that the area at the back will be contracted as shown in the sketch. A raise will be driven from the back of the station to the level above. Through this raise an air-line and a water-gauge line and the wires to the auxiliary starting-box will pass. There will also be a ladder-way. At the bottom of this raise there will be two air-tight doors forming an air-lock. When everything is running smoothly, these doors will be open and the heated air, which is usually present in the back of a pump-station owing to the heat from the motors, will pass up the raise and fresh air come in at the bottom. This will have the minor advantage of having the electric motors working in a cooler atmosphere. In case anything happens to the motors or pumps, the lower air-tight door is closed, and as the water rises in the mine sufficient air will be admitted through the air-tight door to balance the water-pressure due to the rising water. The air may either be obtained from the mine air-line, or, if this is out of order also, the small amount of air necessary can be forced down through a hand air-pump as shown. Two gauges are provided: one, a water-gauge to measure the hydrostatic pressure of the water in the mine, and the other, to measure the pressure of the air that is forced into the pump-station to balance this hydrostatic pressure.

At the bottom of this raise is an air-lock. Men can go down the raise to the top of the pump-station, close the upper air-tight door, and by releasing the valve in the lower air-tight door they can gradually become accustomed to the pressure; then they open the lower air-tight door and pass into the station to make the necessary repairs. It can be seen that the men can work for a considerable time before the pressure will become too great for their lungs. The raise can be made large enough so that the various parts of machinery can be hoisted in and out of the pump-station.



When men are working in the pump-station under pressure, caustic soda (sodium hydrate) should be placed about the station to absorb the carbon di-oxide that is exhaled.

An auxiliary starter is shown in the sketch on the same level as the hand air-pump. This is merely used to start the motor to obviate going down the manway, passing through the air-lock, and thence entering the pump-station, in order to start the motors when the shut-down was due to power trouble.

Simple Tests of Economic Minerals

By HERBERT LANG

The old-time prospector, intent only on the discovery of paying deposits of gold, or of silver, did well to confine himself thus narrowly, because in his day there was little local demand for anything else. But nowadays, when the necessities of the world embrace such diverse things, the old methods are outgrown, and the modern prospector, when he shall come on the scene, will find a much larger outlook and will need a greater range of knowledge. There is needed a class of painstaking men that will make it their business to look up deposits of any kind that possess present or even future economic value, and to go over a comparatively restricted area with a vigilant eye for everything in the way of minerals. Almost any mineral now has value, either actual or potential, and even the soil and common rocks are worth careful inspection. There are fortunes in this kind of prospecting if properly performed, but to do it properly requires more knowledge and adaptability than are ordinarily possessed. On the whole I do not think that a trained mineralogist is precisely the right man to tackle such work. Many expert 'rock-sharps' have tried it, but I cannot think of many that have made a success of it, either for themselves or for the State. Probably the reason is that they undertook too much and covered too much ground. Success will be achieved by the careful scrutiny of a comparatively limited area, taking account of every mineral exposure, no matter how insignificant, and leaving nothing for the next man to find out.

It would naturally be supposed that all the resources of a complete laboratory would be required in such a pursuit; but such is not necessarily the case. No one need be discouraged because he cannot take a great store of apparatus into the field, because a good deal may be extemporized and all the rest done without. This is especially true in the examination of simple minerals, for which primitive methods of determination are almost always possible. No doubt some analytical work must eventually be done; yet the prospector may remain away from the chemical laboratory indefinitely and still find plenty to do in the field.

To identify a mineral offhand is frequently difficult to an expert, and may prove impossible to the prospector in the mountains. Aggregations and mixtures of minerals, of course, are still more difficult, requiring from the first the assistance of chemical analysis. This is especially true when quantitative results are desired instead of qualitative, when 'how much' takes the place of 'what'. Naturally the first thing done is to note its color, its hardness, and its crystalline form (provided that it be a simple mineral), and the finder anxiously 'hefts' it, knowing that as a rule the heavier rocks are more valuable than the lighter. This is so certain that no prospector should pass over a specimen that is strikingly heavy without a close investigation into its character. This may require the services of a skilled chemist; but in default of such aid the intelligent prospector may do a good deal to inform himself of the nature of his find, by homely and extemporized means. Some would advise the searcher to take along this and that piece of apparatus, thus loading him down with articles of which he can make no present use. A scale of hardness, embracing at least eight fragments of stone is often prescribed; but the indications thus got invariably have to be taken in connection with other tests, more difficult, perhaps, to carry out, and even then certainly may not be reached. The prospector must at least take his magnifying glass, his pocket-knife, and his horn or pan, and I will suppose him to be also provided with a small glass-stoppered bottle of sulphuric acid, and a test-tube or two. In default of the test-tube he can make use of a glass tumbler. A small cast-iron mortar and pestle come handy, but in lieu of them an anvil or the smooth surface of some weatherworn boulder may answer quite well. It is surprising how much may be found out by means of these simple tools.

The taste of some soluble minerals serves to identify them at once. Common salt, saltpetre, epsom salts, and the sulphates of iron and zinc cannot be mistaken. The prospector who intends to go into the desert regions of this State will do well to familiarize himself beforehand with the taste of some of the more common chemicals found in the dry lakes there. Some other substances, like clays, have also a smell of their own. Clay, by the way, is worth looking for. First-rate clays, suited to the manufacture of firebrick, pottery, and porcelain, are scarce, and will well repay the finder. In testing clay it should be moistened and rubbed between the fingers, when it will generally, but not always, form a sticky or plastic mass, which is a good feature. A piece molded into brick-form may be heated as hot as possible in the camp-fire, to ascertain if it cracks on drying, as most so-called 'fat' clays do. This is no injury to its quality. If it burns red or black it betrays the presence of iron or manganese, which render the material useless for making firebrick or porcelain, although it may still be of use in making common brick or cheap pottery. Try a sample in the blacksmith's forge, to find if it fuses. If so, let it alone.

The desert salts are now being sought for with avidity, especially those of potash and soda. It would materially assist those that go to look for them to familiarize themselves with the crystal form of the principal of those salts, such as borax, the chlorides, and nitrates, which they can do easily enough by purchasing a nickel's worth of each, and taking a few crystals along. In default of this, a few simple tests will serve. Borax is detected by dissolving a little of the suspected substance in a saucer in the least possible water, adding a few drops of sulphuric acid, then some alcohol or strong whiskey, and setting the latter on fire. A bright-green flame proves that borax, or at least boric acid, is present. The nitrates are also easily distinguished. Mix the suspected substances with some combustible material and set it on fire. It will add to the amusement of camp-life if somebody's tobacco pipe is surreptitiously charged with a mixture of Virginia's weed and some native saltpetre, and the unsuspecting owner induced to smoke it. A miniature volcano results, and there is much surprise and a good deal of fun.

To get really satisfactory results it is necessary to recrystallize the usually impure and mixed salts, which may be done by a simple process of evaporation in a glass, or even an iron dish, taking plenty of time, and removing the crystals as soon as they form on the sides. Then compare them with the samples that have been brought. The nitrates are especially impure, much of the stuff supposed to be saltpetre not containing above 5 to 10% of the pure nitrate. However, it is easily purified, all the impurities being left in the mother liquor after the nitrate has deposited.

It is a pity that there is no rough-and-ready way to discriminate between soda and potash in the field. But to do so requires the use at least of the blowpipe, and a sheet of blue glass, which the prospector might object to carrying.

It would appear that the old-time prospector was invariably baffled when it came to telling tin ore. The fact is that tin is one of the easiest metals to detect. Its ore, the oxide (cassiterite) is usually black, or nearly so, and is quite heavy. It looks so much like magnetic iron that many have thought they had a tin mine when it was only an iron prospect. Take a piece of the suspected ore, powder it, mix it with charcoal powder, and heat it in the blacksmith's fire, and you will get globules of tin—maybe. But do not set too much store by globules said to have been melted out in the forge, for the most of those shown came from tin-cans. After you have got the globules, hammer one out flat like a silver dime, hold it to your ear, and listen for the 'cry' that all tin makes when bent.

It is not everybody who can tell molybdenite from graphite. In fact, the ability to tell them apart seems to stamp one as an expert. It is easy. Just rub a little on your thumb-nail. Molybdenite stains it gray or green; graphite stains it black.

There may be people that do not know iron ore when they see it. If such there be they can easily learn. First, powder a little of the suspected rock and apply the magnet (note: all minerals should be powdered before applying the magnet); if it lifts the grains the ore is magnetite, the prevailing iron ore in California. If it does not lift them, it may be hematite or limonite. Throw a chunk into the camp-fire and cover it with hot coals and leave it for an hour or two. Scrape the outside of the chunk, powder the product, and try the magnet again. If iron, it will have been reduced to the magnetic form and will be lifted. To tell hematite from limonite, powder the ore finely. Powdered hematite is red; powdered limonite is brown or yellow. Weigh a chunk of iron ore on the scales at the nearest grocery, and burn it in the camp-fire. Magnetite will lose no weight; hematite will lose a trifle, but not enough to be told on the scales; limonite will lose a great deal, sometimes as much as one-seventh.

The carbonates are a numerous and important class; they are the stumbling-block to the miner, who generally lumps them together as 'lime'. Yet they are easily told apart. There are carbonates of lime, magnesia, lead, iron, manganese, baryta, and others, all of which are valuable in their places. Throw a piece into the camp-fire. It is a good thing to 'burn' an ore or rock, especially if you don't know what else to do. If the fire is hot enough they lose their carbonic acid and fall to pieces. If the residue is white, taste it. If lime it will prove very hot in the mouth. If magnesia it will be disagreeably bitter. If iron or manganese it will have turned dark, and you may tell whether iron or manganese by applying the magnet, provided that the fire has been hot enough to make the iron magnetic. Manganese, of course, has no effect on the magnet. However, carbonates are more than likely to be a mixture, iron with manganese, lime, or magnesia, lime almost always with magnesia, etc. The burnt lime will slake. Mix it with a little water and it will get hot. Magnesia will not, and slakes slowly. Lead carbonate needs no testing other than heating in the camp-fire, when lead is quickly reduced, long before the other carbonates would have been affected at all. Besides, it is heavy, which gives the clue to its composition. The acid-bottle is handy now, for all carbonates effervesce with acids, the most of them freely with even vinegar or lemon-juice. Always pulverize the mineral before testing with acid.

The carbonate of baryta is both rare and valuable: there is but one mine of it in America, and that, naturally, is in this State. It would be a better mine if there were no sulphate of baryta in it. The sulphate, however, is useful and profitable in some countries. Over here it is frequently mistaken for scheelite, the favorite ore of tungsten, which it somewhat resembles. To tell which is which throw a piece into the camp-fire or onto a hot stove. Heavy spar (baryta) has a tendency to decrepitate (fly to pieces) on heating; scheelite does not. Both are otherwise unaltered at this heat. Barite (heavy spar) is about as hard as limestone, and about as heavy as iron ore. Scheelite is both harder and heavier. There is sulphur in barite, none in scheelite. The sulphur test should be learned and applied. Powder the mineral, mix a trifle with soda (baking-powder or washing-soda will answer), add a drop of water, and place on a piece of charcoal. Using a candle if you have no proper lamp, blow with the blowpipe until you are tired. Then place the melted mass, which should be as big as a buckshot, on a cleaned silver coin, add a drop of water, and let it alone for a time. On removing it, if sulphur had been present, a black stain will show on the coin. It will be well to make a blank assay beforehand, to ensure the absence of sulphur from the water and soda used, for both these may contain it. This test reveals sulphur, no matter what form it may have been in, and should be fully mastered by the investigator. It depends on the reduction of the sulphur by carbon to the form of sulphide of sodium, which is soluble, and in its turn is decomposed by metallic silver, forming the black sulphide of silver.

Zinc ores have been much sought after of late, the carbonate especially. Prospectors have often been much puzzled about the lime carbonate intermixed with the zinc carbonate, and quite unable to tell them apart by the looks. Having recourse to the acid-bottle, add a little sulphuric acid to the powdered ore and wait until all the gas has gone off. If lime is present a heavy white powder (gypsum) will be left in the bottom of the glass. If zinc, the sulphate will have been formed, but it will dissolve in water. Both may be present. Add water, pour off the solution after it has settled, and add a little baking-powder or washing-soda previously dissolved in water, when a heavy white precipitate of zinc carbonate will fall.

Zinc-blende, which some miners call by the stupid name of 'black jack,' is harder to identify, but it often has to be done. If the color of its powder—white to brown, according to the amount of impurity—is not enough, throw a piece in the fire and let it heat a long time, smelling it occasionally to detect sulphur. After a while a coating of oxide will form; this is nearly white when cold. It generally serves to identify the mineral, but if not considered satisfactory, the oxide may be dissolved in a little sulphuric acid, plus water, and the baking-powder test applied, getting a white precipitate as before.

Diatomaceous earth (infusorial earth, or kieselguhr) should not be overlooked, especially if near a railway or seaport. This and a similar rock, tripoli, which results from the decomposition of silicious limestone, are frequently mistaken for clay, though so much lighter in weight. Unlike most clays, they do not form a plastic mass with water, so they cannot be stuck together in brick form and hardened by heat.

Quicksilver ore is generally known by the red color of the cinnabar. To make certain, pulverize some ore finely and wash it out in the horn or pan, and save the concentrate. Cinnabar is brittle, and you cannot save more than a small part of it. Put the red particles on a clean sheet of iron and heat over the camp-fire, when they, if cinnabar, pass off in gray smoke. This is conclusive.

The commoner ores of manganese are dark, quite black in most cases, their powder is also dark and has the property of soiling the hands. The di-oxide, the prevailing ore, may be discovered thus: Powder it and mix with an equal amount of salt. Place in a tea-cup and add sulphuric acid. Chlorine will be set free, a greenish-yellow gas which will fill the cup and may be smelled (very cautiously, since it injures the lungs). It has a strong and disagreeable smell, which cannot be forgotten. It comes from the salt, not the manganese. Why then use the manganese? Let the reader supply the answer.*

These rough-and-ready tests, which might be multiplied by hundreds, so as to embrace all the minerals in the field, are only intended to show what can be done with apparently inadequate means. Still, it would seem to be much to the advantage of the prospector to prepare himself for more systematic and far-reaching examination of what he finds, which he can only do by learning the use of the blowpipe. This takes time and labor, which few would care to expend upon so apparently trivial an instrument. Some use it as a matter of course; but most practitioners tend to advance beyond blowpipe practice and take up analysis in the wet way, and become chemists. The most progress is made and the best results are got by those that practice in both ways, but men of this sort rarely find the time for any prolonged investigations in the field.

Flotation of Zinc-Lead Tailing in Idaho

During the quarter ended September 30, 1918, the Consolidated Interstate-Callahan company's mill near Wallace, Idaho, treated old tailing only, by flotation. Results are as under:

Tailing concentrated, tons	42,661
Zinc content, per cent	11.13
Lead content, per cent	2.05
Silver content, ounces	0.81
Recovery, per cent	85.63
Zinc in concentrate, per cent	47.19
Zinc in concentrate, pounds	8,117,806
Lead in concentrate, per cent (also 12.20% zinc)	66.00
Lead in concentrate, pounds	62,222
Silver in lead, ounces	990
Cost of making one ton of concentrate, at shipping point	$8.068

The War Trade Board announces that, in addition to the General license PBF No. 14, covering the importation of iron ore from Sweden and Spain, when coming as ballast in ships returning from these countries, licenses may be issued for the importation of a maximum total from all sources of 70,000 tons of low-phosphorous iron ore from Spain, Sweden, Norway, and North Africa, provided the said ore be imported and entered prior to July 1, 1919. By low-phosphorous iron ore is meant that which contains the proportion of not more than 0.012% of phosphorus to 50% of metallic iron. The total amount of low-phosphorous iron ore so permitted to come forward will be allocated by the Bureau of Imports.

Exportation of platinum is to be taxed and limited in Colombia, the Chamber of Deputies authorizing the Government until July 20, 1919.

---

*Why so secretive, Mr. Lang? The manganese carries the oxygen that combines with the acid to release the chlorine gas.—Editor.

Electrostatic Precipitation

By R. B. RATHBUN

[*]While the engineer should carefully weigh the merits of the various types of equipment, he must bear in mind that the object of his plant is the recovery of suspended solids, and a thing is unimportant except as it contributes to this end, other engineering principles being duly considered. The controversy regarding the use of synchronous motor-driven rectifiers by which the power for the treater is taken directly from the mains of the local power system, rather than the motor-generator rectifier giving each treater unit its own isolated electric system, has led many to think that on the type of rectifier depends the success of the plant. It is in fact a relatively unimportant part of the plant, and represents a small fraction of the investment; the recoveries in dust and fume are practically the same in each case. One large smelting concern has adopted the motor-generator type for all of its plants after years of experience with the synchronous-motor type. Its reasons are practically the same as those set down by Mr. Eschholz for his preference. Given more in detail they are:

1. An independent electric system prevents outside power-line conditions, like voltage fluctuations, from interfering with the operation of the Cottrell plant and eliminates the possibility of the Cottrell plant causing trouble for the power company. The latter, while not very probable, must be considered, for it is sometimes difficult to convince the transmission engineer that the make and break of the synchronous switch, which is the rectifier, does not introduce destructive voltage transients into his system like the well-known phenomena attending high-tension switching. It is not surprising that the power company hesitates to take any chances for the small amount of load acquired.

2. An isolated electric system for each treater prevents the possibility of any disturbance in one treater being communicated to the other treaters through the transformers and rectifiers.

3. By means of the generator-field and the exciter-field regulations, the treater potential may be maintained very close to the critical disruptive value. This is considered essential for good work and can only be equaled when using a synchronous-motor type method by the use of an induction regulator with remote electric control, which is more complicated than a simple rheostat control in the generator field.

4. The motor-generator is free from all the drawbacks to which the synchronous motor is subject, such as falling out of step and hunting.

Against these things is urged a slightly smaller first cost and approximately 86% power efficiency, as compared with a 76% efficiency of the motor-generator set. In addition, if the synchronous-motor method is used, the large power system will tend to absorb the surges, while the small generator circuit will tend to reflect and magnify any wave distortions that may be present. But if there are no wave irregularities, this function of a large power system is not necessary. Oscillograms taken on a large motor-generator Cottrell plant in Utah showed the treater and transformer circuits to be remarkably free from these surges. In this case, however, the generator wave was a true sine without any irregularities. Oscillograms taken on a large plant at Coram, California, where synchronous-motor rectifiers and induction regulators were used, showed that steep wave-fronts and surges were present to a marked degree, in spite of the absorbing qualities of a large power system. Oscillograms taken on three plants recently constructed, where motor-generators were used, showed that under certain conditions of the load voltage transients in the high-tension side of the transformer circuit became troublesome. In these plants the voltage wave was not a true sine, a number of small peaks or harmonics being apparent in the wave. The small peak that occurs just at the point of breaking contact is seen in the oscillogram to be manifest in the wave on the high side of the transformer greatly magnified, due to the steep wave-front in the primary wave. From the foregoing it is a fair assumption that if the voltage wave of the generator is a true sine, with no steep wave-fronts, there is no disadvantage due to surges in motor-generator rectifiers. This method, then, should not be condemned on account of a defect in a particular type of generator used. It seems better to correct the defect in the generator, although this defect has not proved as detrimental as might be supposed, for in every case known to the writer this surge, which makes itself manifest by arcing across a protective spark-gap placed across the high-potential terminals of the transformer, decreases so as to be negligible as soon as the gas is in a state permitting good precipitation with either method. There are electrical remedies that often prove beneficial, such as absorbing this oscillating energy by inserting ballast resistance in the primary and secondary circuits, or by shunting condensers across the primary circuit. Sometimes the inductive reactance of the circuit may be changed to advantage; and, too, the critical frequency of the system may be changed by changing the rectifier to contact to only one alternation per cycle without any loss in precipitation in the treater.

* * *

Lead pigments sold in the United States during 1917 amounted to 87,331 tons of white lead in oil, 27,869 tons dry, 25,478 tons of red lead and orange mineral, and 44,102 tons of litharge. The total value was $36,663,923. This value is 18% above that of 1916, but 3% less in quantity.

* * *

The platinum (20,923 oz.) brought from Russia to the United States in January 1918 was refined at the New York Assay Office to a fineness of 999 and above. It yielded 17,640 oz., of platinum, 65 oz. of palladium, 182 oz. of iridium, and 49 oz. of rhodium.

[*] Discussion of papers of O. H. Eschholz, presented at the Colorado meeting A. I. M. E., September 1918.

Copper Export Association

The new association of American copper producers (organization of which has been under way since passage of the Webb-Pomerene bill in the last Congress held) elected the following officers and directors: Chairman of the board, Simon Guggenheim; president, John D. Ryan; first vice-president, Walter Douglas; second vice-president, R. L. Agassiz; and secretary and treasurer, C. W. Welch.

Directors: Murray Guggenheim, Simon Guggenheim, and F. H. Brownell, American Smelting & Refining Co.; John D. Ryan, Cornelius F. Kelley, and Benjamin B. Thayer, Anaconda Copper Mining Co. and Inspiration Consolidated Copper Co.; W. D. Thornton, Greene-Cananea Copper Co.; Charles Hayden, Charles M. MacNeill, and D. C. Jackling, Utah Copper Co., Nevada Consolidated Copper Co., Ray Consolidated Copper Co., and Chino Copper Co.; Walter Douglas and James McLean, Phelps Dodge Corporation; R. L. Agassiz and James MacNaughton, Calumet & Hecla Mining Co.; Stephen Birch, Kennecott Copper Corporation; William A. Clark, United Verde Copper Co.; Archibald Douglas, United Verde Extension Mining Co., Adolph Lewisohn, Miami Copper Co.; and Gordon R. Campbell, Calumet & Arizona Mining Company.

An executive committee was chosen consisting of: Chairman of the board, president, first vice-president, second vice-president, and the following directors: James McLean, Murray Guggenheim, Cornelius F. Kelley, William A. Clark, James MacNaughton, Adolph Lewisohn. The executive committee will choose a selling committee, in whose hands actual conduct of the business will be placed. The executive committee will, under the board of directors, determine policies with regard to the export trade of the association.

John D. Ryan, chairman of Anaconda Copper Mining Co., speaking for the new association, gave out the following statement:

"All the important copper producers of the country are represented in the directorate. The plan adopted by the association is purely a mutual one. Only a nominal capital is proposed. Two hundred fifty thousand dollars of preferred will be offered pro rata to all producers and each producer will be entitled to one share of common stock, with cumulative voting power, based upon his production of copper. Common stock will have no par and no market value, as it is provided that no earnings shall be divided among the common shareholders, and any profit made, after providing for dividends or a retirement of the preferred, will be credited to the producers in proportion to their export sales.

"Every producer, large and small, in the country, will be invited to join the association on precisely the same basis as the larger interests; that is, all representation, voting rights, and other privileges are based upon the proportion of production and export of each member of the association.

"Prices will be averaged over monthly periods and each producer will receive identically the same price at the seaboard for his product.

"It is believed that the plan being a purely mutual one, and providing for no advantage on account of the size or location of any contributing organization, will fulfill the expectations of its promotors and firmly unite all American exporters of copper.

"The production of American smelters and refineries was, before the War, fully 70% of that of the whole world. It is believed now to be 85%. About 60% of the pre-war production was exported. It is expected that proportion will continue to hold good. The Federal Trade Commission, in its investigation of the copper trade, found that by combination of buyers in European countries and manipulation of markets for futures the foreign consumer had been enabled to obtain his copper from American producers, over a period of years, for about 1 cent per pound less than the American consumer has paid. It is believed that the Export Association will remedy this situation, and, without interfering with the domestic trade, will not permit the foreign combinations to secure such undue advantage.

"The fact that every producer, large and small, in the country, has been or will be invited to join, and the door will not only be open, but will be kept open for any who desire to come in, will undoubtedly satisfy every possible requirement of public policy and it is the belief of all the copper people that the organization is formed along ideal lines to commend itself favorably to the Federal Trade Commission or other governmental agencies having to do with the regulation of export trade."

Mr. Ryan explained that every producer who signs an agency agreement will receive one share of common stock, which is without par value and without market value. Each share of common stock will represent one vote for each 500 tons produced in the 12 months preceding the time when the vote is taken. The 7% preferred shares have a par of $100.

"In the past," said Mr. Ryan, "copper exports have approximated 60% of production. This is running at the rate of 2,500,000,000 pounds a year, and if the 60% ratio holds good this country will export 1,500,000,000 pounds of copper a year. If foreign selling agencies have been able to make one cent a pound out of the copper we sold them, it means that they have taken out of our pockets $15,000,000 annually. We would like to keep that $15,000,000 here," said Mr. Ryan, "and spend it in this country."

Every copper interest of any importance is in this movement. The metal will be sold at a net price f.o.b. New York. All details of the association have been submitted to the Federal Trade Commission. It has been incorporated under laws of Delaware. The total issue of common stock will depend upon how many producers come into the association. Five hundred shares of no par value have been authorized.

"It would seem," said Mr. Ryan, "as if Europe had been milking the copper industry in this country for about $20,000,000 a year for twenty years."

Bill of Relief for Miners

On December 16 Senator Henderson introduced the following bill for the relief of miners and mining companies that had suffered loss while responding to the Government's urgent solicitation to promote chromite, manganese, and other war minerals.

A Bill to supplement an Act of Congress approved October fifth, nineteen hundred and eighteen (public, numbered two hundred and twenty), and to authorize the Secretary of the Interior, from the funds appropriated by said Act, to determine, adjust, and pay losses sustained by investments preparatory to production of war minerals mentioned in said act.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Interior be, and hereby is, authorized and directed to ascertain and determine the amount or amounts of money heretofore invested or contracted to be invested and obligations incurred by any and all persons and investors for producing or acquiring property for producing, within the United States, to supply the urgent, published, and evident needs of the Nation during the war, any ores, metals, minerals, or mineral substances mentioned and enumerated in an Act of Congress approved October fifth, nineteen hundred and eighteen (public, numbered two hundred and twenty), entitled "An Act to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of those ores, metals, and minerals which have formerly been largely imported, or of which there is or may be an inadequate supply;" and that said Secretary ascertain, determine, adjust, liquidate, and out of the moneys provided and appropriated by said Act pay to the parties entitled thereto the amount of such losses and damages as he, the said Secretary, shall find and determine have been sustained and suffered or are likely to be sustained and suffered, by reason of having made such investments for said purposes or having produced surplus stocks of such materials; and that in each case he shall make such determination, provision, settlement, advancement, or final payment, and by agreement with owners and claimants make such other adjustment or take such other action as he shall find and determine to be just, equitable, reasonable, and expedient; and that he make such provisions as he may deem necessary, advisable, and reasonable to prevent further losses pending final decision, settlement, and disposition in any case or cases; that the payments herein authorized be made to the claimant or claimants the said Secretary shall find to be morally, equitably, and justly entitled thereto; that in ascertaining and determining the losses and damages sustained or to be sustained, and the adjustments, settlements, payments, and provisions to be made, the said Secretary shall consider the prices and conditions existing at the time of each investment and the prices and conditions existing prior to the war, as well as those existing at the time of such determination, adjustment, and settlement, together with all of the circumstances and conditions of each case; that the final determination, decision, provision, disposition, and action of said Secretary in each case shall be conclusive and final; that all payments shall be made and all expenses incurred by the Secretary paid from the funds and appropriations provided and appropriated by said Act of October fifth, nineteen hundred and eighteen (public, numbered two hundred and twenty), and that said funds and appropriations shall continue to be available for said purposes until such time as the said Secretary shall have fully exercised the authority hereby granted and performed and completed the duties hereby provided and imposed.

Sec. 2. That a report of all operations under this Act, including receipts and disbursements, shall be made to Congress on or before the first Monday in December of each year.

Sec. 3. That nothing in this Act shall be construed to confer jurisdiction upon any court to entertain a suit against the United States.

An Oil Flotation Patent

The following interesting patent has been called to our attention. It is U. S. No. 744,171, dated November 17, 1903, application filed on December 1, 1902, granted to Henry Tadwell Davis and Ernest Perrett, of Lewisham, England, assignors to Davis-Perrett, Limited, of London, England. It is called a 'Method of Separating Oily or Similar Impurities from Water'.

Among other claims are these:

1. The method of separating oily and similar particles from water containing the same in emulsive condition, which consists in passing an electric current through the emulsified water for the purpose of *causing the oily particles therein to unite with metallic particles and float on the surface of the liquid* and separating the supernatant product, substantially as described.

2. The method of separating oily and similar particles from water containing the same in emulsive condition, which consists in mixing with the liquid a suitable electrically conductive liquid, and causing the oily particles to unite with a suitable metal and become disengaged from said water by electrolyzing the mixture between metallic electrodes, substantially as described.

3. The method of separating oily and similar particles from water containing the same in emulsive condition, which consists in passing an electric current through the emulsified water for the purpose of causing the oily particles to unite with iron, substantially as described.

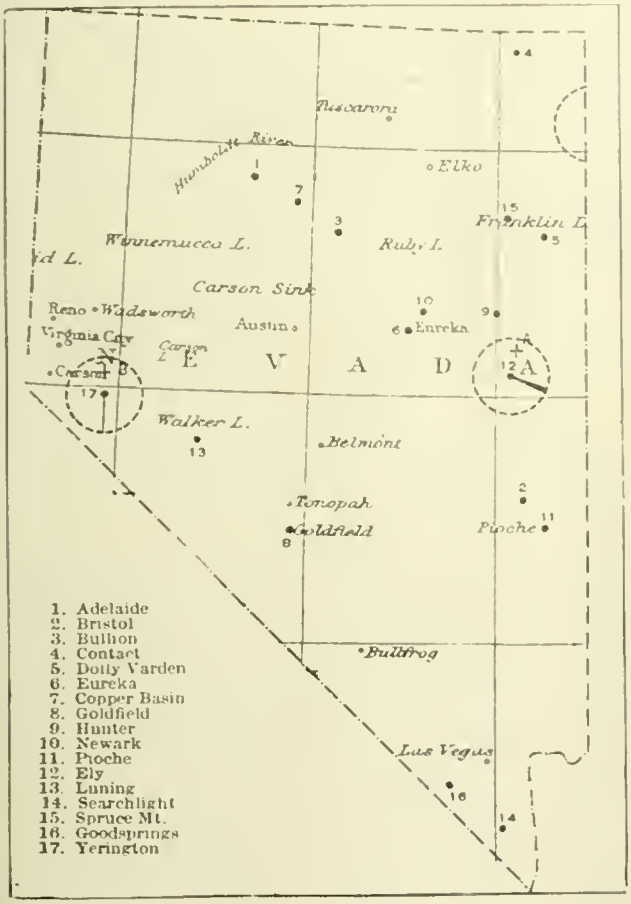
4. The method of separating oily and similar particles from water containing the same in emulsive condition, which consists in mixing therewith a suitable conductive liquid and electrolyzing the mixture between iron electrodes, thereby causing iron to unite with the oil and removing the supernatant product thus formed, substantially as described.

REVIEW OF MINING

RENO, NEVADA

Copper Mines and Effect of Lower Prices.

Producers of copper metal and of copper, manganese, and tungsten ores in this State are facing difficulties greater than have been presented even during the war period, by reason of the demoralized state of the metal market. In recent months many prospectors and claim-owners have devoted their utmost efforts to developing and marketing ores for which the War created a demand. The collapse of the market, following the armistice, has left these men in a serious plight. Instances are known of men having ore in transit, paying demurrage on cars, and with no prospect of realizing anything from their product. Others have incurred debts that they will be unable to meet. Ore shipments have ceased nearly everywhere in the State. The Wall Street copper mine near Luning, shipments from which have averaged 700 tons monthly, has been closed and has dismissed over 100 miners. F. M. Manson, manager for the Western Ore Purchasing Co., which receives the bulk of Nevadan custom ores, says that the smelters are making preliminary settlement for copper on the basis of 11 cents per pound, the remaining payment to be made when a market is established. Samuel Newhouse of Utah, who has been here, said this figure, 11 cents, had been established on an estimated basis of 6 cents below the market, making a theoretical market value for copper of 17 cents, but offering no assurance of any fixed price to producers. It is said that only large companies, able to carry their metal stocks or possessing funds to carry on development work, can avoid closing down if the existing chaotic situation continues for any appreciable time. Production of the Nevada Consolidated Copper Co. at Ely has not been affected, according to late reports. The Mason Valley Mines Co. maintains a normal output of copper matte from its smelter at Thompson. Copper ore has been exposed in considerable volume in the Jumbo Copper Mountain property, north-east of Luning and west of Rawhide, and a mill is to be built as soon as it can be operated at a reasonable expense. Confidence in the future demand for copper is stimulating the search for this metal by prospectors. Several companies are being organized for the purpose of intensive prospecting over wide areas. Each company will have several prospecting parties in the field, under the direction of an engineer and equipped with field assaying outfits. It is designed by this means to bridge the gap between the prospector and the development company.



Map Showing Copper Districts of Nevada. Smelters are at Ely and Thompson. (U. S. G. S.)

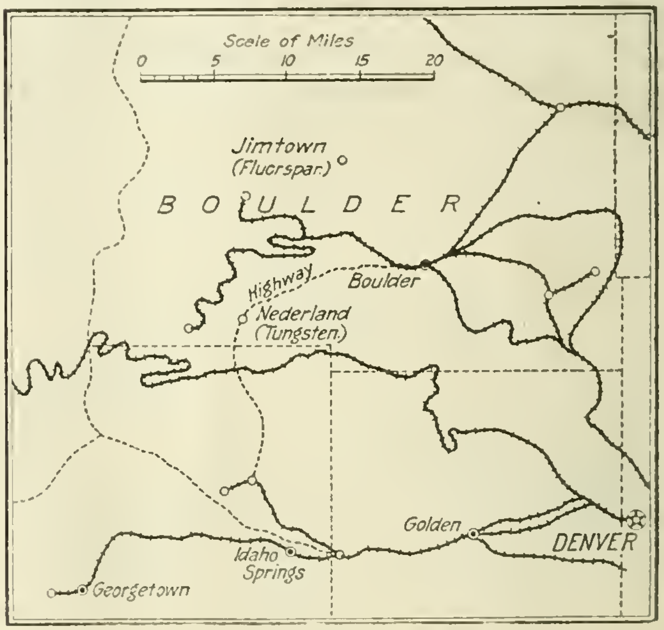
DENVER, COLORADO

A Little Wyoming History.—Also a Boulder County Affair.

In the recent death at Los Angeles of Willis George Emerson, there terminated a human career as dramatic as that of the fictitious J. Rufus Wallingford. The recent prominence of this financier has been in connection with the notorious Emerson Motors Co., but the country at large has reason to remember him better through his remarkable manipulations, two decades ago, in southern Wyoming. The history of his project reads more like fiction than reality. It is difficult for anybody now, in retrospect, to believe that an individual could accomplish the things he did, 'get away with it', remain within the law, and evade all serious consequences.

About 1896 a Wyoming sheepherder named Ed Haggerty located a group of claims covering the outcrop of a strong lode showing heavy indications of copper, in Carbon county, Wyoming. An interest in the claims was soon acquired by a man named Ferris, and the property thereafter was spoken of as the Ferris-Haggerty mine, although it was located as the Rudefeha group. The two owners succeeded in organizing a company to which they sold the property for $40,000. About this time, Emerson, a Kansas banker with some available capital and plenty of influence, appeared in Wyoming and soon seized upon the Ferris-Haggerty as the nucleus of a gigantic chain of promotions. In those days, Wyoming law did not permit a corporation to secure a charter to do business in more than one special branch. This fitted Emerson's schemes to a T. He and associates are said, upon good authority, to have bought out the company then owning the mine by actually paying a million dollars, the property thereby going into the possession of the new North American Copper Co. As the mine was devoid of all transportation and treatment facilities, it was essential that it be provided with its own smelting plant. The nearest suitable site for a smelter was at a point on the North Platte river, fully 16 miles from the mine. A smelting company was floated. To convey ore to the plant it was logical to incorporate a tramway company and to erect what was then the longest aerial tram in the world. Inasmuch as a smelter must not be isolated from sources of supply and market for its products, the Saratoga & Encampment Railroad Co. was incorporated and the road built. Such a great project being unable to operate without homes for employees and officials, the townsite of Grand Encampment came in for another big promotion. The city grew like magic and substantial stores, banks, hotels, and homes were erected. Other corporations were chartered to build and operate water-works and to furnish electric light and power to the city and the smelter. Coal mines were purchased and placed in the ownership of a new coal-mining company. An irrigation project was framed to add agricultural features to the district. Stocks in the many companies were sold readily throughout the country. Altogether some $20,000,000 was put into Emerson's schemes. To his credit it must be said that he made a pretty good showing, spending money liberally in every individual project and putting in first-class equipment. The mine was systematically developed, the tramway worked well, the smelter was a model of its period, and the railroad was complete. Things boomed along for a time; there were regular activities by every link in the chain; there were shipments of bar copper frequently. Yet the shareholders—perhaps Emerson himself—failed to perceive that an unjust burden had been put upon an out-of-the-way copper mine by requiring it to support so many thousands of people, to pay liberal salaries to officials, to carry the overhead on $20,000,000, and to furnish dividends. Before the inevitable crash came, Emerson had time to get from under, although he has always since claimed he was frozen out. At any rate he avoided prosecutions and appeared as the injured victim of "the Standard Oil crowd," in his own words. He must have emerged from the whole bubble well financed, as his subsequent life was one of leisure and comfort. He was something of a litterateur and wrote several interesting books on Western life, some of them vividly portraying the exciting times at Grand Encampment. Nothing but desolation and decay remains of the Ferris-Haggerty mine, the tramway, the city, or the smelter. There are engineers who assert that the mine has merit and could yet be made to pay under rational operation.

Boulder county has a reputation for springing surprises on the mining fraternity. Every few years the county comes forward with disclosures of unsuspected but valuable metals or non-metallic minerals. Jimtown was long and favorably known as a gold district. About a year ago, when it was decidedly dull, a sudden revival occurred in the discovery that hitherto neglected fluorspar veins could be profitably worked. Two abandoned gold mills were rehabilitated to concentrate the crude fluorspar before its shipment to Eastern steel plants. On ordinary tables, by skillful manipulation, most of the silica, pyrite, and other impurities can be eliminated from the Jimtown fluorspar. During the dressing of this ore, a millman observed a tiny streak of particularly heavy black mineral, which his curiosity caused him to save, his hope being that he had discovered platinum. Good money was being made from the sale of the fluorspar, but the recovery of platinum, even in small amount, would be velvet. He took a small quantity of the heavy concentrate to the U. S. Bureau of Mines station at Golden. Tests for platinum there proved negative. However, while handling the tiny sample, one of the Bureau chemists identified pitchblende, and made as careful a test for radio-activity as the quantity of material would permit. It seems that the millman declined to tell the chemists the source of the sample, either as to district or preparation. The Bureau possibly exceeded its function in giving out a statement that the sample showed 0.1% U_3O_8. Soon thereafter the Denver dailies appeared with full-page advertisements of the Colorado Pitchblende Co., which claimed to own an area one mile wide and two miles long, embracing the heart of Jimtown's fluorspar belt. The company has a fluent press agent, who has supplemented the advertisements with stories about the solid mountains of fluorspar carrying wonderful quantities of magic radium, etc. It is rather unusual for any mining community to dispute the claims of its own people to valuable strikes, but, in this instance the Boulder County Metal Mining Association and the Boulder Commercial Association promptly took issue with the promoters of this stock-selling concern, and caused an investigation of the matter to be made by such men as R. D. George, State geologist, and J. B. Ekeley, professor of chemistry in the State University. Their findings were sufficient to discourage further attention to this affair, but the promoters immediately came back with full-page advertisements severely criticizing the investigators and simultaneously laying stress upon the analyses of their ore made by a chemist who had long been connected with the Government, not one of the chemists at Golden. The promoters likewise insisted upon an unbiased investigation by one or more of Denver's civic organizations. It was the purpose of the company to sell stock in Denver, but this would be precluded by Denver's blue-sky ordinance unless some such authoritative favorable report were secured. In consequence, the Denver Civic and Commercial Association and the Denver Manufacturers' Association has each selected an engineer who is personally supervising the mining, milling, and assay of ore taken from the company's holdings at Jimtown. Dr. Lind of the U. S. Bureau of Mines insists that unfair use was made of the information given out by him, and he believes that his low result was secured from a sample representing a concentration of raw ore in a ratio of at least 1200 to 1. Be that as it may, the world is full of 0.1% uranium material, and no value attaches to this excitement. Your correspondent predicts a negative report from M. S. MacCarthy and James M. McClave, the two engineers now making the official investigation. [The prospectus of the Colorado Pitchblende Co. was unfavorably commented upon editorially in the 'Press' of December 28.—Editor.]



PART OF COLORADO, SHOWING BOULDER COUNTY

The Colorado Metal Mining Association and American Mining Congress met at Denver on January 2 and 4.

THE MINING SUMMARY

ARIZONA

Hayden.—The Lavell Gold Mining Co., with A. H. Parker as engineer in charge, has erected a 50-ton mill. This includes a crusher, Quinner pulverizer, amalgamating plates, concentrators, and a 120-hp. Fairbanks-Morse engine and dynamo. A 4-mile road is being constructed between the mine and mill. A large quantity of high-grade gold-silver-lead ore is said to be blocked out. The mine is 8 miles from Hayden.

Jerome.—Returns from the first shipment of ore from the Shea mine to the United Verde Extension smelter yielded 9.56% copper, 191.34 oz. silver, and 0.26 oz. gold per ton. A little less than 13 tons was shipped and netted the company $2800. When making arrangements for treatment the following samples were submitted to the U. V. X. Co.: (1) Gold 0.17 oz., silver 424 oz., copper 22.7%, silica 30.4%, iron 2.6%; (2) 0.09 oz., 186 oz., 9.6%, 15.8%, 9.2%; (3) 0.10 oz., 258 oz., 13.3%, 45.6%, 9%; and (4) 0.99 oz., 150 oz., 8.1%, 44%, 15.6%, respectively. The shipment was made from ore mined and sorted from the drift running west from the bottom of the 350-ft. incline shaft.

Mayer.—W. W. Elliott is superintending erection of a reduction plant at the old Peck mine in the Bradshaw mountains. This mill is designed to treat $20 silver ore.

CALIFORNIA

The U. S. Geological Survey has surveyed and sign-posted a great area of the most dangerous desert region of the United States. The thirty-ninth Annual Report of the topographic division of the Survey, just made public, describes the method employed of making the desert safe to the unwary traveler. The region surveyed occupies about 60,000 square miles in southern California and south-western Arizona. In California it includes the southern part of Death Valley and the region between this valley and the Mexican border; in Arizona it includes the region west of Tucson and Phoenix and south of Wickenburg and Parker. This region was selected because it it the driest, hottest, and least explored part of the desert region, and also because of the strategic importance of obtaining information on the water supplies along the 350 miles of national frontier that it includes. The field work was done by four parties, each of which consisted of one geologist and one non-technical assistant outfitted with an automobile and light camping equipment. Practically all watering-places in the region were examined, about 160 samples of water were collected and shipped to the water-resources laboratory at Washington for analysis, and a general exploration was made of the geography, geology, and ground-water conditions of the region. The maps prepared and the data obtained were made available to the Army engineers for incorporation in the progressive military map of the United States. Guides with maps are being prepared for publication.

Signs directing travelers to water were erected at 167 localities in California and 138 in Arizona. The sign-posts are galvanized iron, 1.9 in. outside diameter and 12 ft. long. Each post is anchored in the ground with two redwood blocks. The signs are 18-gauge steel, galvanized, are white, with dark-blue letters, and are substantially bolted to the posts. They are of two sizes, 18 by 20 in. and 9 by 20 in. Most of the larger signs, of which 470 were erected, give the names, distances, and directions to four watering places; most of the smaller signs, 165 of which were erected, give the names, distances, and directions to two watering-places. The work done last year is a part of a comprehensive plan for mapping and marking the watering-places in the entire arid region lying east of the Sierra Nevada and Cascade mountains, and west of a line running approximately from eastern Oregon through Salt Lake City and Santa Fe to the mouth of Pecos river.

Grass Valley.—The Idaho-Maryland mine is to be re-opened by Bulkeley Wells, of Colorado, and others.

Idria.—New Idria Quicksilver Co. paid 25 cents per share on January 1. This is equal to $25,000. Previous distributions were $50,000. Word from Hollister states that the New Idria is to electrify its plant. Rights-of-way papers for the King City-New Idria power-line have been filed by the Coast Valleys Gas & Electrical Co. and work will begin shortly. The proposed line will cost $85,000. At present the company generates its power with Diesel engines using crude oil. The oil is hauled in from Mendota and is a source of heavy expense and inconvenience, being handled by truck.

Martinez.—The new electrolytic works of the Butters company are in full operation at Peyton, employing 30 men.

Redding.—The Arps Copper Co. of Copper City has given an option to John A. Rice of San Francisco on the Arps, Reno, Sacramento, and Black Oak groups of mines—37 claims. The option expires on July, 1921, and calls for the aggregate payment of $200,000, to be made in installments of $50,000.

Victorville.—The United Tungsten-Copper Mines of New York and Los Angeles, whose tungsten properties are in the Morongo district, San Bernardino mountains, has completed purchase of the remainder of the machinery for the tungsten mill. As soon as weather permits, the heavy machinery will be trucked from Victorville. By a sluicing process heretofore employed, the company has been able to produce a high-grade concentrate—above 70% WO_3. This concentrate takes the form of translucent crystals. Smith-Emery & Co. of Los Angeles states that this is the highest grade of concentrate that has yet been brought to its office for analysis.

COLORADO

Aspen.—The Newman Leasing Co. paid a dividend of 25%, equal to $12,500, during December. An old property was re-opened and is being worked profitably.

Breckenridge.—The Farncomb Hill Gold Dredging Co. paid a 5% dividend early in December. This is equal to $15,000 on the $300,000 capital. R. W. Foote is president. Several years ago, when the Tonopah Placers Co.'s No. 2 dredge reached the upper boundary of the ground owned by the Farncomb Hill in Swan valley, the Tonopah company made a contract with the Farncomb Hill to dredge its ground— paying a royalty on the net proceeds of the gold recovered by the Tonopah company from the leased ground. The arrangement proved satisfactory and has enabled the Farncomb Hill to pay dividends without having to operate the property itself.

Idaho Springs.—The old North American sampling-works have been re-modeled by the Clear Creek-Gilpin Ore Co. Ralph Chase, for years with the Chamberlain sampler at Black Hawk, is assayer; W. E. Passmore is manager.—M. T. Chestnut was recently at Idaho Springs, examining property in Virginia canyon.

IDAHO

Boise.—The State inspector of mines, Robert N. Bell, gives the following approximate metal output of the State for 1918: lead, 275,000,000 lb.; zinc, 45,000,000 lb.; and silver, 9,000,000 oz. In 1917 the respective figures were 375,000,000 lb., 95,000,000 lb., and 12,000,000 ounces.

Burke.—The Hecla company in November sent 200 tons of zinc ore daily from the Oro-or-no-go vein to its leased mill, and 600 tons of lead-silver ore to the Gem mill. From 35 to 45 tons of high-grade lead-silver ore is also mined daily. Between 500 and 550 men are employed. Driving is progressing on the 2000-ft. level alongside the vein, where it is valueless. By this means timber will be saved.

Mullan.—Profit of the Federal M. & S. Co. during the quarter ended October 31 was $371,972. In the two previous periods the figures were $323,309 and $62,945.

Wallace.—Agents of powder companies in the Coeur d'Alene have announced a cut in prices. This reduction is not large, but it is expected to be followed by others. Those grades of powder that have been $28.50 per 100 lb. have been reduced to $26.50; the pre-war price was $14.50. Grades that have sold for $35 are reduced to $31; this sold for $18.50 before the War.

The Success company reports having 2000 tons of ore broken on the 700-ft. level stope. At 1400 ft. the stope is 50 ft. long, at 1500 ft., 110 ft. long, while at 1600 ft. stoping is to start on a shoot 80 ft. long and 3 to 7 ft. wide. This is the richest lead-zinc orebody opened so far. While the mine was closed for four months the cost of maintenance was $21,000. An assessment of 2 cents per share has been levied.

A vocational school for miners, giving practical instruction in rock-breaking, use of powder, timbering, pumping, and other underground work will be established at Wallace, as part of the short course offered by the University of Idaho at Moscow. An eight weeks term will be held, most of the time being spent in one of the big mines. Lieutenant Frank H. Skeels, engineer and practical miner, has been placed in charge of the vocational school. He recently returned from a military training camp to take this work. The course is being established by the university under the recent Smith-Hughes act by which the Government furnishes half the money for such a course and the State the other half. If the course proves the success that is expected, Idaho will be asked for an additional appropriation for enlarging the work.

MICHIGAN

Houghton.—Champion Copper Co. pays $6.40 per share on January 15. During 1918 there was $19.20 paid, against $44.80 in 1917, $60.14 in 1916, and $31 in 1915.

St. Mary's Mineral Land Co. pays $2 on January 15. This makes $7 for 1918, just half of the distribution in 1917.

MISSOURI

Joplin.—Production of the Tri-State region last week was as under.

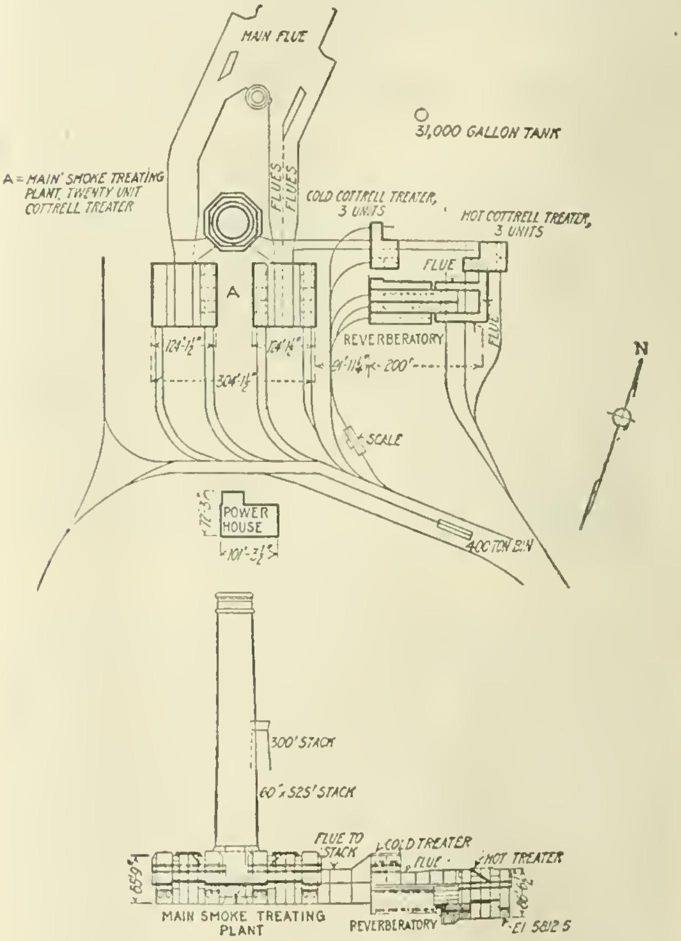
State	Blende tons	Calamine tons	Lead tons	Value
Kansas	278	...	61	$17,668
Missouri	1080	590	580	......
Oklahoma	1986	...	858	289,121
Average per ton	$44	$37	$80	......

Over 10,000 tons was sold. The price of blende declined $2.50 per ton.

A 250-ton (in 10 hours) mill has just been erected by the Henryetta Lead & Zinc Co. at Smelter Hill. Bessemer gas-engines will drive the plant, also an air-compressor. Three shafts have opened ore, shown by 22 drill-holes. M. G. Brady is in charge.

MONTANA

Anaconda.—The new smoke-stack at the Anaconda Copper company's Washoe Reduction Works is 585 ft. 1½ in. high, according to the 'Butte Miner'. Removal of the scaffolding from the interior of the chimney is finished, and construction of the connecting flues is in progress. The stack was built in 142 days. It has an octagonal base 86 ft. high, above which it is circular, with five different tapers. The thickness of the walls varies from 60 to 22½ in. Outside dimensions are 86 ft. across the base and 63⅞ ft. at the base of the cap. The chimney-blocks (17,000 tons) used in construction are the Custodis type. They are made in five different lengths, 4, 5, 7½, 8⅝, and 10⅝ in., and vary in width from 6½ to 6⅞ in., but are of the standard thickness of 4⅝ in. The blocks are all laid in a mortar of cement, fire-clay, and sand (10,350 bbl., 1850 tons, and 2700 cu. yd., respectively). The cap for protection of the top of the chimney from weather and gases is of special terra-cotta blocks, with interlocking joints. To protect the chimney from lightning, two down-leading copper cables are fixed on opposite sides of the stack. These cables are connected with an intersecting cable near the top of the chimney, to which are attached 20 copper rods, each 8 ft. long and tipped with platinum. To protect the copper from the action of gases, the 20-point rods, winding cable, 50 ft. of the two down-leading cables and anchor, are coated with lead ⅛ in. thick. The chimney has an outside ladder from base to cap which is provided



Plan and Elevation of New Stack at Washoe Works, Anaconda, Montana. (drawing from 'Power').

with body-guards. The radial blocks used throughout the construction were manufactured by the Anaconda company and delivered to the site on flat-cars. The blocks were made from slime-flotation tailing, mixed with sand. The brick machines of the American Clay Machine Co., type No. 290, which has a capacity of 100 tons per eight hours, were used in making the bricks. The blocks were burned in an Oregon kiln of 26 chambers to a temperature of 1800 F. The Alphonse Custodis Chimney Construction Co. designed and erected the chimney.

Butte.—Anaconda Copper has declared a dividend of $1.50 per share, equal to 6% per annum. Previous distributions were $2 per quarter.

Neihart.—The Ripple Consolidated Mining Co. has been incorporated in Montana with James H. Rowe, president, James A. Canty, vice-president, and H. A. Frank, secretary and treasurer. The property is six miles from Neihart, Cascade county, and consists of 10 claims, including the Ripple and Black Diamond groups. The ore carries silver and lead, and it is the intention of the company to erect a 100-ton mill as soon as arrangements can be made.

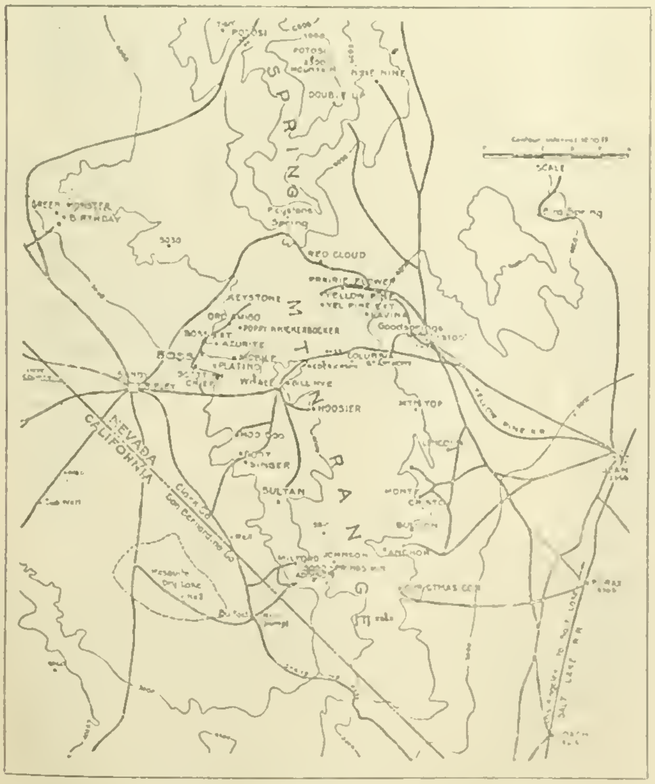
NEVADA

Auburn.—The White Pine Copper Co. has been organized at Salt Lake City with a capital of 1,000,000 shares, $1 par value. G. T. Hansen is manager. The 9 claims are 24 miles south of Ray, on the Nevada Northern. Tunnels and cross-cuts have opened 5% copper and 3-oz. silver ore. Equipment includes a 325-cu. ft. air-compressor, 1000-ft. aerial tram, and camp.

Dayton.—The Dayton Placer Recovery Co. is now cyaniding 175 tons daily of old Comstock mill tailing extracted from the Carson River valley. Gold, silver, copper, and mercury is saved. G. T. Hansen is general manager and C. I. Sherwood manager.

Goodsprings.—According to the 'Gazette', the Hoosier mine has just been examined for the new owner, the Galena Canyon Mining Co.——The Manse claim of the Boss group is yielding some good copper ore for the lessee.——The Copper Chief, Bill Nye, Columbia, Dawn, and Anchor mines are all producing.——The Bullion and others are opening encouragingly.

The Yellow Pine Mining Co. paid 12 cents per share on December 16. This amounts to $120,000, and makes $300,000 for 1918.



Map of Goodsprings District, Nevada

NEW MEXICO

Petaca.—A large mica deposit is being opened in this district of Rio Arriba county by L. M. Stiles and J. C. Miller. They report that during 15 months they have mined over 40,000 lb. of 'black' mica, which is cleaned and stored, and over 150,000 lb. of cleaned 'scrap' mica. The deposit was worked as early as 1852 by Mexicans.

OKLAHOMA

Picher.—Production of the various centres last week totaled 4986 tons of blende and 858 tons of lead, valued at $289,124.

TEXAS

Orla.—Development of the large sulphur deposit of the West Texas Sulphur Co., in Culberson county, about 15 miles from Orla, will be started on an extensive scale soon, according to W. H. Beard, general manager. The company has finished construction of a mill and refining plant.

UTAH

Alta.—Columbus-Rexall paid 2½ cents per share, equal to $14,659, on December 30. This is the only company in the Alta district that distributed anything during 1918.

Green River.—The Shinntown and Needles manganese companies have suspended mining, while the May Dew is working on a small scale.

Marysvale.—The potash plant of the Florence company resumed treatment of alunite last week, after being closed for over two months. There is about 400 tons of ore to be treated. After this the mill is to handle ore from the Nebraska-Utah Potash Company.

Tintic.—The Liberty Manganese Co. in the West Tintic district has suspended operations on account of the state of the market. A few carloads of ore was shipped. The property is well equipped for a large output.

WASHINGTON

Leadpoint.—The Electric Point Mining Co. distributed 5 cents per share, $39,675, for Christmas. This makes a total of $253,785 in two years. Ore has been sent to the U. S. S. R. & M. Co.'s smelter at Midvale, Utah, as the smelter at Trail, B. C., is not receiving foreign lead ore. The Northport smelter, Washington, is reducing a carload daily.

CANADA

British Columbia

The Provincial government proposes opening up the Duncan River district, which is highly mineralized, by granting financial assistance for construction of a wagon-road. The minerals of the area, which has been handicapped in development by lack of transportation facilities, include gold, silver, copper, lead, and zinc, occurring in promising conditions.

Anyox.—Granby Consolidated pays $2.50 per share, equal to $374,962, on February 1. The November output was 1,970,027 lb. of copper from the Hidden Creek mines and 177,378 lb. from the Phoenix mines, a total of 2,886,489 lb. This is the lowest yield for 1918, save that of 2,580,288 lb. in February.

Rossland.—Conditions are improving in this gold-producing centre, due to resumption of work by the Consolidated M. & S. Co. Up to the end of November the War Eagle-Centre Star-Le Roi group sent 88,934 tons of ore to the smelter at Trail.

PERSONAL

Note The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Fred J. Pope of New York is in Nevada.

H. Hardy Smith has left London for Osaka, Japan.

J. E. Smith of Ketchikan, Alaska, is at the Manx hotel.

F. H. Skeel has returned from Camp Humphreys to Wallace, Idaho.

Eugene A. H. Tays is now stationed at San Blas, in Sinaloa, Mexico.

Morton Webber is at Butte He is expected shortly in San Francisco.

Charles E. Prior, Captain in the Motor Transport Corps, is still in France.

F. M. Hartman, of Tucson, Arizona, is spending the holidays in San Francisco.

C. A. Burdick has become general manager to the Nechako River Mines in British Columbia.

Robert T. Hill has opened an office at Dallas, Texas, in addition to the one at Los Angeles.

Gilmour E. Brown is consulting engineer for the Mentoukou Coal Mining Co. near Peking, China.

Maxwell W. Atwater has been appointed general manager for the Davis-Daly Copper Co., at Butte, Montana.

Algernon Del Mar is erecting a concentrator for the Montezuma Mining Co., near Big Pine, California.

F. W. Libbey, Lieutenant in the Army, at Camp Humphreys, Virginia, has received his discharge and has returned to Phoenix, Arizona.

A. J. Eveland, of the American Zinc, Lead & Smelting Co., has recently gone to Mexico City, where he will make his headquarters for several months.

John W. Sherman, recently manager for the West End and other mines at Tonopah, has been appointed manager for the Trona Corporation at Searles Lake, California.

Lucien Eaton, Captain of Engineers, honorably discharged, has returned to his former position as superintendent in the Ishpeming district for the Cleveland Cliffs Iron Co., at Ishpeming, Michigan.

Maurice Altmayer, Captain in the French Artillery, representing the Franco-American Department of War Co-operation, is expected shortly in San Francosco. He is engaged in studying the latest mining and metallurgical practice in behalf of French consumers of the base metals.

J. C. Haas was elected chairman of the Columbia section A. I. M. E. at the annual session held at Spokane last week. **William J. Hall**, of the Federal Mining & Smelting Co., Wallace, Idaho, was elected vice-chairman, and **L. K. Armstrong** was re-elected secretary-treasurer.

A meeting to organize a local chapter of the American Mining Congress will be held in San Francisco on January 15

Obituary

In the death of **Ernest H. Simonds** from influenza in Oakland on December 26 the mining profession loses a valuable member. From the days when he was instructor in mining under Professor Christy at Berkeley, to the laboratory he established in San Francisco, about 1898, and more recently to the metallurgical operations on the Mother Lode, where he successfully handled tailings that were, previous to his experiments, thought too low-grade for profitable treatment, all who came in contact with Simonds were impressed by the thoroughness of the man's work, his close attention to detail, and his modest unassuming ways. Those of us who in the old days had occasion to send samples to Simonds' laboratory for analysis always had complete and comfortable confidence in the results obtained by him. What he undertook to do he did well.—C. J.

Alfred McLean Hamilton, who died on November 25, was born at Montreal, Canada, in 1879. He was educated at the Montreal high-school and graduated B. Sc. in mining and metallurgy from McGill University in 1905. While at the University he captained the football team, winning the Canadian intercollegiate championship. During his summer vacations he worked in smelters in Mexico and at Anaconda, taking his dinner-pail and his "chances with the boys". In 1905 he obtained a position at the Washoe smelter, Anaconda. In 1906 he went to Mexico and since then he has been in the employ of the American Smelting & Refining Co. in various capacities, his last being that of manager of the smelters at Velardeña and Aguas Calientes. He rose rapidly under most trying conditions of revolutions and counter-revolutions with the accompanying murders, 'executions', and hold-ups by bands of brigands. On one occasion he went late at night into the little town and destroyed all the whiskey and got up about 1 a.m. and made another round and destroyed the new supply that had already made its appearance. During the successive revolutions a great many men were killed in and around his plants. On one occasion six nice young well educated Mexicans were stood against his wall and shot after the 'general' instructed his men "We don't take prisoners." Men were hung to telegraph poles in and around the plant—one pole having six men hung to it at one time. He pitied the under dog. On one occasion he hid the defeated Mexican 'general' under the bed while he entertained the victorious 'general'. His greatest troubles were the bandits, who rode into the plant drunk, holding him up many times, and with pistols on each side of him and behind marched him to open the safe. On one occasion when some one else had the key he was subjected to a great deal of abuse and he thought he was going to lose his life. On other occasions he considered that his life was saved by calling on some one to bring the camera and he got the bandits to mount their horses and pose for a picture. Sometimes the camera had neither plates nor films. He lost all of his belongings when his house was burned by the Mexicans. His difficulties and worries were increased by his struggles to 'carry on' while unable to communicate with his company, which tried to support him. He left Mexico for a time and started a smelter at Sasco, Arizona. About two years ago he went back to Mexico and again started up the smelters at Velardeña and later at Aguas Calientes. The trouble of getting the smelting plants repaired and started in operation was enough for most men, but he found the people starving and so made efforts to get corn planted to feed them. It was found that the Mexican railways were unable to handle the necessary supplies of ore, coke, etc., for the smelters on account of the revolutionists having burned the cars and blown up the locomotives, so he undertook to re-build 500 cars and a great number of locomotives in the smelter-shops. The Mexican government then levied prohibitive taxes on the company and this greatly worried him, though subsequently the taxes were cut down considerably. About a year ago while in Mexico City he had an attack of ptomaine poisoning. It was thought he would die at the time, but he seemed to be getting over it and returned to his work at the smelter, but finally he had a hemorrhage and it was found that he had heart and lung trouble and he was carried out of Mexico completely broken down, very weak, and suffering from nervous prostration. He died at San Antonio, Texas, on November 25, 1918, in his 39th year. He is survived by his widow, who was Miss Freda Harms of Illinois, and by his mother, five brothers, and three sisters. E. H. H.

THE METAL MARKET

METAL PRICES

San Francisco, December 31

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound	10.00
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	6.25— 6.75
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb.	$110
Spelter, cents per pound	9.50
Zinc-dust, cents per pound	16.00

ORE PRICES

December 31

Chromo, no definite quotations available	
Fluorspar, 85% CaF_2, f.o.b. shipping point or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 51%, f.o.b. South† Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(†Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$0.85
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$17—$23

EASTERN METAL MARKET

(By wire from New York)

December 31.—Copper is inactive and lower at 23 cents from December 26. Lead is dull and lower. Spelter is stagnant and falling

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, which have since been extended to January 1, 1919, prices to be effective on the day of shipment, not the day of sale. Quotations in cents per pound are as under:

Copper production of twenty of the largest properties in North and South America during November totaled 148,763,177 lb., against 154,708,552 lb. in October. The total for 11 months is 1,620,345,326 lb., compared with 1,480,926,956 in 1917.

The London copper market is again open. Standard metal has been offered at 19 cents, but no business followed.

The sliding-scale for copper miners' wages is likely to come into effect again. Many are now being paid on the basis of 30-cent metal, but will be reduced to a 23-cent basis.

LEAD

Lead is quoted in cents per pound, New York delivery. Early in July, producers agreed to fix price at 8.05c. per lb. New York. This was reduced to 7.05c. on December 2. On the 21st all restrictions were removed from lead, the market now being free.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government was taking 40% of the United States quicksilver output, paying therefor $105 per flask, and will continue to pay this until contracts are completed. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the international agreement, the United States is to get 66% of the world's supply of tin; but this control ends on January 1, 1919. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast.

ORES (New York)

Manganese: It is reported that as low as 80c. per unit has been offered for high-grade ore, but no transactions are recorded. There have been no developments in manganese alloys. The domestic output of ferro in November was 36,300 tons, the largest ever recorded.

Molybdenum: The market is nominal at 75c. to $1 per lb., with small sales reported at 85 cents.

Tungsten: No developments are recorded in the ore situation, nor are any sales heard of as representative of the ideas of buyers and sellers. This is also true of ferro-tungsten.

All British metal regulations have been revoked, according to a Consular cable from London on December 18. The Ministry of Munitions announces the following stocks of imported metals (exclusive of old metal and scrap) in Great Britain and in possession of Ministry of Munitions on December 1: copper, 27,530; spelter (g.o.b.), 18,768; spelter, refined, 6544; aluminum, 10,215; soft pig lead, 49,111; nickel, 1735; antimony regulus, 3303 tons. Official orders controlling dealings in chrome ore, tin, copper, brass, cupro-nickel scrap, spelter, and lead are revoked.

Eastern Metal Market

New York, December 24.

Actual buying of any of the metals is negligible. Open markets are assured for nearly every metal by January 1 or before.

The copper market is to be an open one after January 1. Re-sale metal is reported offered already under the official price.

Conditions in the tin market are unchanged.

The lead market has been officially released from control and prices have fallen.

The zinc market is dead with the tendency of prices downward.

The antimony market is unchanged.

The official announcement of the formation of a new export company was made in the last week. It is to be known as the North American Steel Products Corporation, and at its head will be E. A. S. Clarke, now president of the Lackawanna Steel Co. The new company will have its headquarters in New York and will commence business on January 2, 1919. It will have representatives in all parts of the world. A new form of contract has been agreed upon by the contract committee of the American Iron and Steel Institute, which is intended to prevent both over-selling and over-buying, to bind both buyer and seller, and to be strong enough to resist all attempts at cancellation. There is very little buying at the lower level of prices and the market will probably remain dull until some time in January.

COPPER

As expected for some little time, copper will be a free and open market after January 1. This was officially announced after a meeting at Washington last Friday between the copper producers and the War Industries Board. It was a foregone conclusion in the light of the events in steel. The official price continues to exist and will obtain until January 1 at 26c. per lb. for both Lake and electrolytic. No business is reported; demand is absolutely flat. Reports of re-sale offerings are heard, but no confirmation of any sales are obtainable. Some of these are said to have been offered as low as 22 to 23c. per lb. It is also stated that some interests using copper in their products are making sales for future delivery based on a price of copper of 23.50c. In the absence of any business we quote the market as nominal at 26c. Casting copper is still quoted as low as 21c. per lb. An interesting development is the official announcement of the formation of an export company to control and handle export sales of copper. What is to be known as the Copper Export Association has been incorporated and in its make-up are all the principal copper producers. It is expected that this new organization will handle 50% of the output of the companies interested. The undertaking is regarded as decidedly important and as likely to act as a stabilizing influence on the domestic market. [Extended reference to this Association appears on page 23 of this issue.] There seems to be no line on the future price of copper and the outcome is eagerly and in some cases anxiously awaited.

TIN

Developments in the tin situation have been few in the past week. Fundamental conditions are much as they were a week ago. The market is extremely dull. It appears that consumers are sending in very few orders to the United States Steel Products Co. for the tin that it has been allocated by the International Tin Executive to distribute at cost. Present prospects seem to point to a control of the market of indefinite duration, especially if Bolivian concentrates are allowed to continue to be imported without restriction. This importation enables American smelters to operate at a good profit and still sell under the U. S. Steel Products Co.'s fixed price of 72.50c. per lb., New York and Chicago, thus introducing competition in the domestic market and prolonging the time in which the allocated material may be disposed, and hence the period of control. In this connection it is now estimated that the output of American smelters has reached about 1500 tons per month, or nearly one-third the annual consumption. An interesting suggestion has been made which might settle the complicated tin question and give general satisfaction. As it is now consumers know that in a free market tin could be bought for future shipment as low as 56 to 58c. per lb. They argue, why should they be obliged to continue to pay high prices because what some regard as a mistake was made in instituting the present arrangement. The suggestion is that the Government stand whatever loss there may be involved in the allocated tin by throwing the market in the open in every respect, the same as in wool or other materials. This may happen yet. The London and world markets are free again. Arrivals thus far this month have been 1600 tons at Pacific with 80 tons at Atlantic ports.

LEAD

Quite unexpectedly the lead market is the first one to be thrown entirely open. After a meeting Saturday, December 21, the Lead Producers' Committee announced that from that date it would cease to act as the exclusive selling agent and that producers are at liberty to quote individually and that there would be no restrictions as to re-sale metal. This comes as a surprise, but is a pleasant one. One dealer expressed the opinion that the lead market would find itself and return to normal conditions sooner than any and this probably within two weeks, due largely to the fact that the war situation has been handled with practically no blundering. On Monday came another surprise: The American Smelting & Refining Co. announced a reduction in the price of lead to 6.50c., New York, which compares with the former official price of 7.05c., New York, or the re-sale price of 6.75c., New York. This again is another step in the return to normal conditions, as it inaugurates the old two-market situation—the Trust price and the outside market price. Buyers are few and far between. We quote the market at 6.50c., New York, or 6.20c., St. Louis.

ZINC

The zinc market continues extremely dull with demand lighter than in many weeks; some say it is the dullest period in many months. One cause is the large buying that immediately followed the armistice. Then came the prospect of lower prices for steel, which unsettled the prospects of the galvanized market, resulting in a complete holding off in this department of the business. Of course, brass-makers have been out of the market for some time. December and prime Western are generally conceded to be scarce, but January and first-quarter zinc is easier to obtain, particularly from the smaller producers. Either the larger producers are well sold up or they are trying to support the market, as they are not free offerers of this delivery at any concession. The market for early or 30-day delivery seems quotable at about 8.05c., St. Louis, or 8.40c., New York, with first quarter at about 7.80 to 7.90c., St. Louis, or 8.15 to 8.25c., New York.

ANTIMONY

The market is unchanged from last week, with wholesale lots for early delivery held at 8 to 8.25c., New York, duty paid.

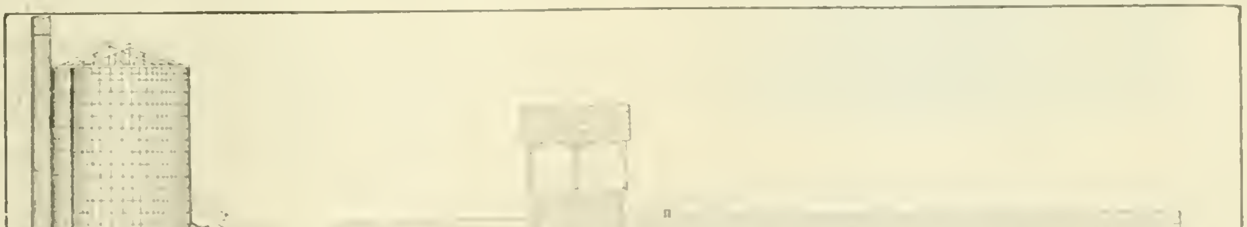
Book Reviews

Quicksilver Resources of California. With a section on 'Metallurgy and Ore-Dressing'. By Walter W. Bradley. Pp. 389, ill., plans, charts, maps, index. Bulletin No. 78 of California State Mining Bureau, Ferry building, San Francisco, from where copies are obtainable.

New publications on quicksilver have been few and far between, likewise articles in the technical press. Between Becker's 'Geology of the Quicksilver Deposits of the Pacific Slope', Monograph XIII of the U. S. Geological Survey in 1888, and Forstner's 'Quicksilver Resources of California', Bulletin 27 of the State Mining Bureau in 1903, there was a lapse of 15 years; while between the latter and Bradley's 'Quicksilver Resources of California', Bulletin 78 in 1918, there is another period of 15 years. A perusal of the excellent 9-page bibliography in the new book shows that, while in the aggregate a good deal has been written on mercury during the present century, the matter of real merit is inconsiderable. In fact, it would seem that it is only within the last four years that there have been discussions of practical value to the quicksilver industry. Until recently there has been little advance in the metallurgy of the metal for 40 years. Bulletin 78 must not be considered another edition of No. 27; it is something quite new, save for certain excerpts from Forstner. The author has had it in preparation for about three years, during which time he made many field and original laboratory investigations. Quicksilver men knew that the work was in preparation, and now they have available a volume that brings the subject down to the latest improvement, more especially metallurgy.

As California yields approximately 70% of the United States output of quicksilver (1917 figures), this work is particularly opportune for local interests. This State has produced 2,137,728 flasks since 1850, valued at over $101,000,000. A production and price-chart shows that the two highly-productive periods—1861-1869 and 1875-1883—were accompanied by low prices, though each was immediately preceded by a sudden increase in price. The increased output at present is responding, in a measure, to the stimulus of the higher prices of the past three years, yet not fully. A graph of prices during the war period is instructive, the speculation during early 1916 being most prominent, also the subsequent drop. Government action in 1918 practically stabilized the price. Chapter II briefly discusses the general geology of the Californian deposits and theories of ore deposition. The cinnabar is found at or near the contact of sandstone or serpentine in the Coastal Ranges. Prefacing the notes on mercury minerals, there being 20 species of which only three are of commercial importance, are three natural color reproductions of cinnabar. In chapter IV we find 175 pages covering Californian quicksilver districts, mines, and works, scattered through 29 counties. Inserted are 18 geologic maps (some colored) and plans of underground openings of the principal mines, also 40 illustrations depicting various operations. Being on coated paper these are well reproduced, as are all the 77 photos in the book. The new matter pertaining to producing properties is of considerable interest.

The most valuable part of this text-book is the metallurgical section of 117 pages, with 37 photos and 20 drawings. It is all new, including Mr. Bradley's own experiments on concentration, those of the U. S. Bureau of Mines on losses, and those of the staffs of certain mines. This will remain a standard of reference for many years. There is little literature on this phase of the industry. Quicksilver metallurgy is simple. Producers have been satisfied with the recovery, and up to 1916 little sampling and assaying had been done to determine the percentage obtained. No systematic investigation in concentration was done until 1913. For calcining ore, the D-retort is useful only for high-grade ore and concentrate. The Scott furnace was designed in 1875, and may be styled the standard in California. It has its advantages and defective points. The cost of operating the Scott furnace is from 50 to 75c. per ton, plus 25 to 50c. for other charges. The recovery from one ore, assaying from 0.26 to 0.36% mercury, was 91.3%, at another, under careful supervision, treating 0.66% ore, it was 86.6%; but Mr. Bradley has publicly (meeting of A. I. M. E.) stated that it was doubtful whether over 75% has been recovered by average furnace practice in California. There follow descriptions, operations, costs, and pictures of the Johnson-McKay pipe-retorts, Livingston furnaces, Lander's continuous-feed retort, Exeli, Knox-Osborne, Neate, and Huttner-Scott furnaces; also the latest adaptation—the



The furnace is fed by screw-feeder from the ore-bin. The fuel is oil, and the air is heated by passing over the hot ore-tailing. The mercurial fume then passes through dust chambers, tile headers, brick condensers, junction-boxes, cast-iron condensers, tile headers, and tank-type condensers of wood. The fan shown above the dust chambers is for blowing cold air into the condensing system. (Plan from State Mining Bureau Bulletin 78.)

rotary-kiln furnace, as at the New Idria mine. In multiple-hearth furnaces, such as the Herreshoff, dust is a nuisance, but with the Cottrell precipitator this is avoided. At Almaden one of these furnaces is now at work. Condensers have been constructed of brick, but wood is preferable, as it does not absorb mercury. Condensing methods have been erratic in the past. The vertical circular wooden tank seems to be the best condenser. It is necessary that the fume be cooled as soon as possible after leaving the furnace. The introduction of cooled air is advantageous.

There seem to be great possibilities for the revolving type of calcining-furnace. These cost $250 per ton of capacity against $1000 for the Scott type, the consumption of fuel is one-third to one-half that of the Scott, labor is one-fifth to one-fourth, and the furnace is automatic. It is more flexible than the Scott, the ore passes through in 15 to 30 minutes, and there is no mercury left in the ore-tailing. There are no absorption losses in the furnaces, as all the brick is hot. There is no personal element attached to the rotary, as the discharge is automatic, whereas in the Scott this is irregular. The furnace now working at New Idria is 4 by 50 ft.; it makes from 1½ to 4 r.p.m., and treats up to 96 tons of 1½-in. ore daily. No salivation of the workmen is possible on account of the joints at each end of the furnace. Four others, 5 by 56 ft., have been erected. A sectional view of the plant accompanies this review.

The assay of cinnabar is either by distillation or solution. Nine pages are devoted to the various methods, particularly the Whitton apparatus. New Idria uses a combination of distillation and solution.

In the concluding 68 pages, those who have conducted tests in the milling of cinnabar, will find a fund of real practical value. Tests made at the University of California showed that in wet concentration of cinnabar the feed must be classified before passing to tables. 'Paint' cinnabar cannot be collected by tables, but the native metal can. By flotation, paint and slime ore can be collected. The flotation results are highly interesting. The specific gravity of cinnabar is 8, yet quicksilver miners considered concentration impracticable. Concentrate must be roasted, but if the mercury content is too high, that is, as much as 40%, this product packs in the furnace. A wet plant would cost half as much as a furnace plant. Brief notes are given on ore-dressing at a number of mines. Summarizing his metallurgical investigations, Mr. Bradley considers that furnace treatment will continue to be the method used for recovering mercury from ore. Concentration may serve as an adjunct to some existing plants, to increase their capacity; while at others concentration or the sodium sulphide method can be economically adopted, depending on the nature of the ore and gangue.

It would have been well if a little more care had been given to the editing of the text. The adoption of the number sign for No., the use of dashes for the minus sign, the irregular employment of the prefix Mr. before the names of those cited, and erratic spelling (such as sulphide and sulfide) might have been avoided.

It might be added that this useful Bulletin is not free, but the charge is a nominal one, simply to cover the cost of publication. The State Mining Bureau will advise further as to the price.

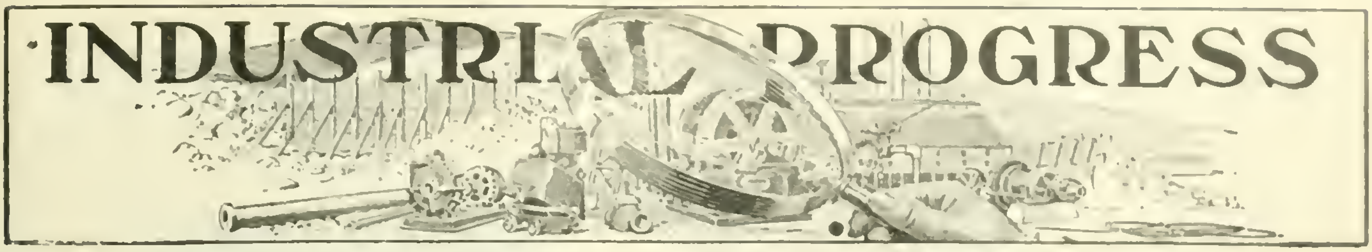
M. W. vB.

Metallurgy of Lead. By H. O. Hofman. Pp. 661, ill., plans, index. McGraw-Hill Book Co., New York, 1918. For sale by Mining and Scientific Press. Price, $6.

By the use of thinner paper the author of this new edition has been able to add [illegible] pages of new matter, and yet the publishers made a book of 661 pages a half-inch thinner than the previous one of 579 pages. In addition to this, the margins are narrower, so that in all the present work is fully 25% larger than the last one, which was mostly rewritten. The author is a well-known authority on lead; since 1892 he has reviewed annually in 'The Mineral Industry' the progress made in the metallurgy of this metal; and he visits the principal reduction works in North America from time to time. Comparing the new chapters with the previous edition, we find that the historical and statistical introduction is much better. The 'Properties of Lead' has been condensed by giving the compounds separate treatment, yet enhanced in value by half-tones of several forms of the metal. The chapters, 'Lead of Commerce' and 'Industrial Alloys' are new. Discussion of 'Lead Ores' includes their occurrence, distribution, and purchase; in the previous volume these were in separate chapters, rather the better arrangement. The former 38 pages on sampling are omitted. The advent of blast-roasting of lead-sulphide ores has resulted in the smelting of these in reverberatories becoming obsolete, yet the treatment of the intermediary products of a refinery in these furnaces has grown in importance, therefore the chapter covering the subject is retained. Recent plans and actual results from certain plants make the chapter on smelting in the ore-hearth much more valuable. Chapter IX, 'Smelting Lead Ores in the Blast-Furnace', occupies half of the book—330 pages—and is a considerable expansion on the former section on this subject. The reactions in roasting sulphides are given, followed by descriptions of furnaces, details of blast-roasting (Huntington-Heberlein, Carmichael-Bradford, Savelsberg, and Dwight-Lloyd, the last in detail at the new Bunker Hill & Sullivan smelter in Idaho), plans of modern blast-furnaces and accessories, ore-bins, fuels, calculation of charges, flue-dust and flues, etc. The remainder of the book is occupied by the desilverization of lead bullion, giving the processes in vogue and their products. A short chapter on lead poisoning, an important subject, completes a complete work on lead. A feature of the new edition is the large number of references.

Structural Service Book. Pp. 138, index. The Journal of the American Institute of Architects, Washington, D. C. For sale by 'Mining and Scientific Press', San Francisco. Price, $3.50.

The fact that no book resembling this one except in a general way has ever been published makes it difficult to write an adequate review. In substance the book is a revised reprint of 12 articles that appeared in the Journal of the American Institute of Architects during 1917. Each article deals with a particular aspect of building construction, the titles being as follows: Research and general standardization, foundational requirements, damp-proofing, cement and concrete, iron and steel; lime, sand and gravel, stone masonry, stone, and slate; clay products and fire-resistive construction; fire-prevention and protection; timber, lumber, and wood construction; electricity; gas; construction by the Government; plumbing and public health; metal, plastic, and other products; paints and painting, glass and glazing. Each number comprises a sort of combined index and bibliography concerning the subjects discussed. This in turn is indexed and cross-referenced by a unique system, which might be described as a cross between the Dewey decimal system and a set of football signals. A general index of subjects, alphabetically arranged, gives references that, just as a handbook is a summary of data on various allied subjects, so this book is a summary of the sources of data on the subjects listed. There is a good deal of repetition, and the book is generally in need of re-arrangement. Nevertheless, it will be of considerable value to anyone engaged either in the design or the construction of buildings, provided that he also has access to a good reference library.



INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

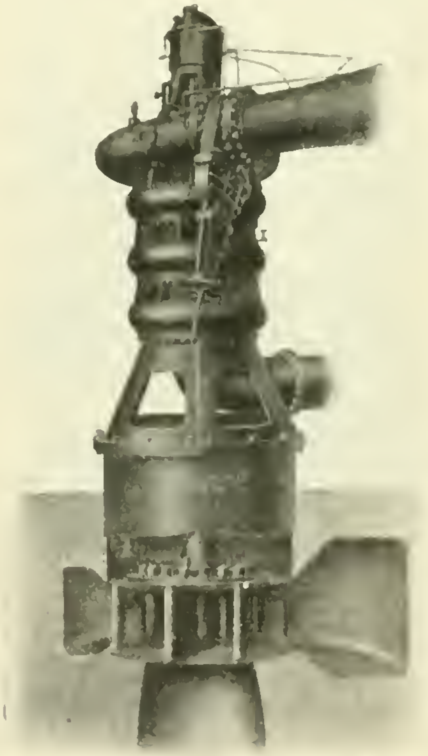
POWER AND PUMPING EQUIPMENT FOR THE YAKIMA PROJECT, WASHINGTON

The plant for the Grandview irrigation district, Sunnyside unit, is at the head of the Mabton feeder canal, two miles from the town of Grandview, on the Sunnyside main canal. It contains one direct-connected turbine-driven pumping unit, and two motor-driven units. All three units receive water from the Sunnyside canal.

The net power-head under which the turbine operates is 21 ft., while the working-head against which the pump operates is 78 ft. The water is discharged through 6000 ft. of 40-in. inside diameter wood-stave pipe, the maximum velocity in the pipe being 3 ft. per second. The horizontal centre-line of the turbine unit is placed 7 ft. above tail-water and 4 ft. below the floor of the pump-house. The turbine is installed in a closed concrete scroll and discharges through a concrete elbow-shaped draft-tube. The turbine consists of a vertical shaft 30-in. type 'O' Smith wicket-gate unit, which under 21-ft. head develops 214 b-hp. at 225 r.p.m. The maximum discharge of the turbine is 110 cu. ft. per second, but at a point of best efficiency it discharges 95 cu. ft. The design of the turbine is such as to give unusually high efficiency over the complete range of gate from half to full opening.

Most of the submerged wearing parts of the turbine and pumps are protected from the action of sharp silt that comes with the water at certain seasons. This design includes the use of a cast-iron speed-ring or guide-ring, imbedded in the concrete scroll. This ring has stationary guide vanes that direct the water in toward the turbine-runner. Inside this speed-ring are placed the top and bottom plates between which are the wicket-gates of the turbine. These top and bottom plates are provided with removable steel wearing-plates, which can be easily renewed. The wicket-gates are of cast steel, and the gate stems or spindles are cast integral with the wickets, and the gate spindles move in bronze-bushed bearings in the top and bottom plates. The gate stems on the upper end extend through stuffing-boxes in the top plate, and all the gate mechanism is on the top plate, where it is in plain view of the operator for inspection and lubrication. This design leaves practically no movable part of the turbine in the water except the cast-steel wickets, and the turbine runner. There is no step bearing in connection with the turbine unit, as it is of the suspended type, and the weight of the rotating element including the turbine runner, the turbine shaft, and the downward thrust of the turbine, as well as the rotating parts of the pump are supported by means of an oil-bath thrust-bearing placed on top of the pump unit, the turbine and pump being so designed as to support this bearing and the load that it carries. The gate operating mechanism of the turbine consists of hand-wheel and worm-gear so arranged that the turbine gates can only be moved very slowly, thus giving fine adjustment and avoiding water-hammer due to the long discharge-line.

The pump is of the vertical shaft four-stage type, with 20-in. diameter intake and discharge openings. It has a capacity of 7500 g.p.m., against 78 ft. total head, and requires 212 hp. maximum. The general design and construction of the four-stage pump consists of four individual cases substantially bolted together, and extends 16 ft. above the floor. The intake connection is made at the bottom, and the discharge at the top of the pump. The three initial or lower stages contain suitable guide-vanes, which guide the water in a continuous stream through the pump. These guide-vanes form a part of the pump casting. The upper stage or discharge-case of the pump is of spiral or volute form, increasing to 20-in. diameter where it connects to the discharge-line, an outside screw rising-stem 20-in. gate-valve being fitted between the discharge-flange of the pump and the pipe-line.



HYDRAULIC TURBINE AND PUMP SET

The hydraulic turbine and accessories, together with designs of the concrete scroll and concrete draft-tube, were supplied to the Government by the S. Morgan Smith Co., of York, Pennsylvania, while the pump unit was made by the Byron Jackson Iron Works, Inc., San Francisco, California. The accompanying illustration shows the combined unit.

A similar combined unit is now in course of construction by the two companies mentioned for installation at the Price Stub pumping-plant of the Grand Valley project of the U. S. Reclamation Service in Colorado. Here the net head on the turbine is 17 ft., and the water is supplied to the turbine through a 60-in. diameter penstock 150 ft. long.

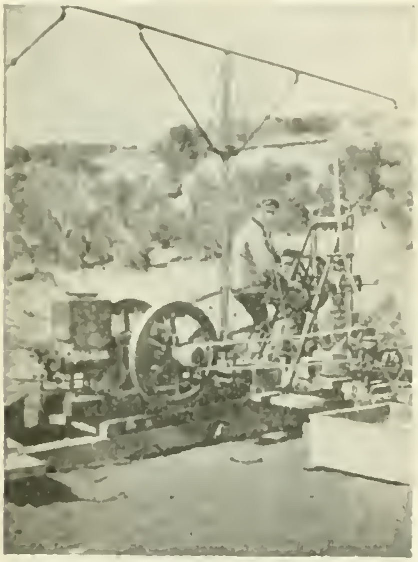
HOW RADIUM-BEARING ORE IS MINED

By Wallace T. Roberts

[*]Of the world's radium supply, 95% is mined in Colorado. In Montrose county, in south-western Colorado, extending through the Paradox valley over into Utah, are large deposits of carnotite, encircling the base of the La Sal mountains.

About six companies have holdings in the Colorado and Utah fields, but all of these are not operating. The largest is the Standard Chemical Co., with general offices at Pittsburgh and head offices at Coke Ovens in Montrose county, about four miles from the town of Naturita, which in turn is about 40 miles from Placerville, the nearest railroad point. The company's property extends over some 400 square miles of rather desolate country characteristic of this part of the State. The Radium Company of Colorado, Inc., is another operating company.

The Standard Chemical Co. employs two methods of prospecting, both by means of drills. The first of these employs the diamond core-drill. A series of holes is first planned, covering a given acreage, at intervals of 25 ft. If one of the holes indicates the presence of ore, a secondary series is then drilled around it, sometimes only a few feet apart. With the diamond-drill holes 40 to 50 ft. in depth are commonly put in, this being as stated, the limit of occurrence of this ore below the surface.



SULLIVAN BRAVO DRILL, BELTED FROM GASOLINE ENGINE. THE OVERHEAD FRAME SUPPORTS A CANVAS WEATHER COVER.

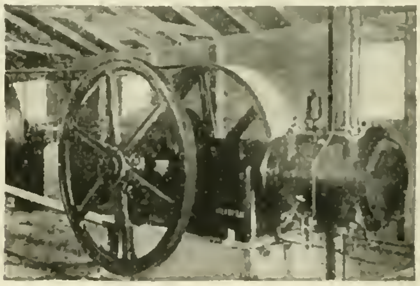
The rig most used, of which a number have been in the district for several years past, is the Sullivan 'Bravo' machine, operated by a belt from a gasoline engine. The drill, engine, and pump for forcing water down the rods are mounted on heavy timbers with low wheels, so that moving from hole to hole is an easy matter. The great number of prospects and their shallowness makes this a handy arrangement. In this formation the rate of progress is perhaps 30 ft. per shift. The cost is low because of this high speed and because the wear of diamonds is slight. At first borts were used in the bits, but later black diamonds or carbon are employed, such as are used in all hard mineral formations in these drills. While the initial cost is more, the cost per foot of drilling is much less. Substitutes for the diamond-drill have been tried, but the combination described above has proved most economical. The drills are operated by a crew of two men with a general foreman in charge of several machines.

Another method of prospecting, still more widely used, employs Sullivan air-tube rotator hammer-drills, weighing 39 lb. each and operated by one man. These machines are used for the shallower holes, seldom exceeding 30 ft. in depth. They employ hollow drill-steel in two-foot changes. A jet of live air, carried down the steel to the bits, acts to blow the cuttings to the surface in spite of such obstacles as clay seams, which are frequently encountered. The powerful rotation of the drill is a factor in enabling it to work successfully to such a depth. Light steel tripods are used to lift the longer lengths of steel. At intervals, or if trouble with dust arises, the steel is withdrawn and a blowpipe used to clean the hole.

BURROS CARRYING WATER FOR DIAMOND-DRILLS.

These Sullivan hammer-drills are operated by gasoline engine driven air-compressors of the Sullivan WG-3 type, one of which is shown in the accompanying picture.

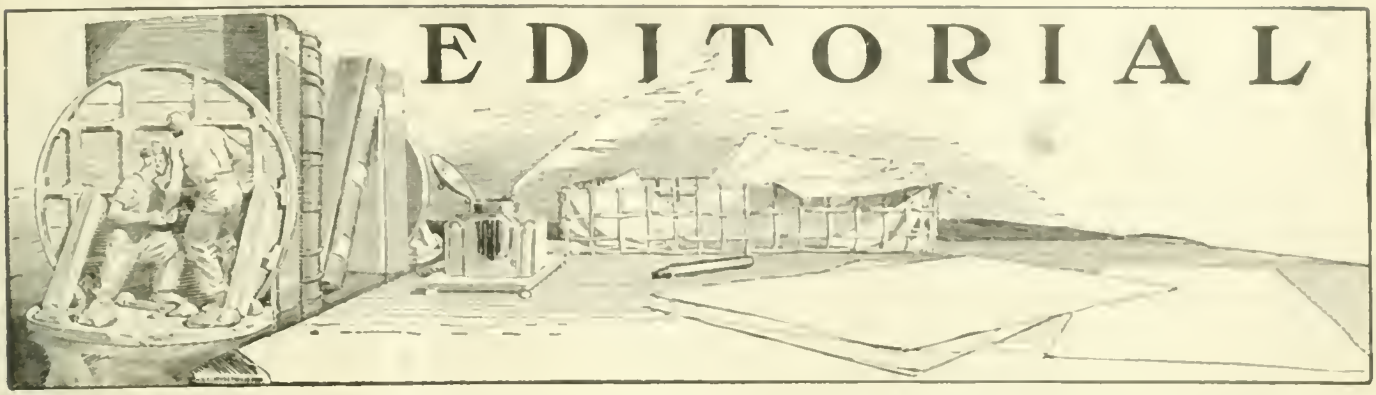
The carnotite mines in a technical sense are seldom 'mines' of much size or elaborateness, owing to the limited extent of the ore deposits. When a body has been sufficiently mapped out and when production is desired from it, a slope is driven and the mining is accomplished with the air-tube rotators described above. Mining is done in the ore under the sandstone strata, on a specialized room and pillar system. The slope is so driven that the tracks are lower than the mining floor. The ore is carried from the face in wheel-barrows and dumped from these into the cars. These cars are of small capacity, and are hauled up the slope by a windlass or a small air-hoist. They are then dumped onto a canvas or platform where the ore is sorted by hand. Little of the carnotite ore runs above 5% in grade. The value consists of uranium oxide (U_3O_8), varying in grade from ½ to 7%. Ore that must be milled is sent to a concentrator 12 miles from the offices at Coke Ovens, and from 4 to 25 miles from the various camps. Shipping-ore, including that above 2½%, is sent to the company's works in Pennsylvania. All ore is placed in sacks, weighing 100 lb. each, as it is sorted, owing to its great value. John I. Mullen is in charge of the Standard Chemical Co.'s property, and has overcome many difficulties.



GASOLINE-ENGINE DRIVEN COMPRESSOR-PLANT

---

[*] Abstract from 'Mine and Quarry'.



EDITORIAL

THEODORE ROOSEVELT is dead! The loss of so vital a personality will be a shock to men in every part of the world. The news comes as we go to press; we hope next week to pay proper tribute to his life and character. So passes a great American.

IN 1918 the United States produced nearly two billion dollars worth of metallic products, the total value of mineral products being estimated at $5,160,000,000, or about $50,000,000 more than in 1917. These figures bear eloquent testimony to the importance of our mining industry.

VARIOUS suggestions have been made for the disposal of the German submarines, now interned at Harwich and other British ports. It seems to us that a good use to make of them would be to scrap them and make structural steel for the rebuilding of the bridges and railways that the Germans destroyed in Belgium.

BONDS to the amount of $25,000,000 at 6% and for a term of 10 years are being issued by the Anaconda Copper Mining Company in order to furnish working capital for the development of its South American properties, more particularly the Andes and Portrerillos mines. This is a notable example of the foreign expansion of American mining activities.

HOPE of better days in Mexico is revived by the recent meeting of representative men at El Paso and the organization of the Union de Los Mexicanos to promote peace and the repatriation of political exiles. It is announced that delegates are to be sent to Paris in order to plead the cause of Mexico at the Peace Congress and to bespeak the assistance of the nations in restoring order in the distracted country south of the Rio Grande. While the United States is aiding in the rehabilitation of distressful Europe it will be proper to invite European co-operation in quieting Mexico.

GOLD production in the United States last year decreased to 3,313,000 ounces, worth $68,493,000, as against $83,750,700 in 1917 and $101,035,700 in 1915. The output in 1918 was the lowest in 20 years. California continues to be the leading gold-producing State, the preliminary official estimate showing 932,389 ounces, valued at $17,207,000, as against $20,929,400 in 1917 Colorado is again second with an output of $12,853,000, as against $15,974,500 in 1917. The silver production of this country in 1918 amounted to 67,879,000 fine ounces, the smallest output since 1913 and 3,861,000 ounces below that of 1917. Montana is the leading producer of silver, yielding 15,341,000 ounces, and Utah is second, with 13,439,000 ounces, the latter scoring a slight gain on 1917. Even the enhanced price of silver, which stood at the Government quotation of $1 during the year, failed to stimulate production to a higher level, owing to the excessive costs of mining.

IMPATIENCE is being expressed in the press on both sides of the Atlantic at the delay in the meeting of the Peace Conference. Preliminary conversations are useful and necessary, of course, and they seem to have taken place with fairly satisfactory results, so far as one can learn, but the world is becoming eager to have its affairs settled before anarchy takes a firm grip. Political and industrial conditions in Central Europe continue in a state of flux and it is about time for concerted action to crush bolshevism, otherwise any effort to call Germany and Austria to account will be frustrated and the completion of a settlement postponed indefinitely. Every week of delay accentuates the disorder in the conquered territories and increases the sufferings of the civilian population, while hindering the conquering nations in the immense task of restoration and rehabilitation in the regions devastated by warfare. Moreover, both in this country and in England there is a growing demand for the demobilization of the armies and the return of our young men to the works of peace.

LABOR adjustments menace many industries, simply because any attempt at adjustment in accordance with the declining market-price of the products resulting from the use of labor threatens to provoke strikes. This, of course, is a serious defect in our economic system. We note that the General Petroleum Corporation, under the leadership of its president, Capt. John Barneson, has announced to its employees that "there will be no reduction by the Company in the present scale of wages for a period of at least two years from this date," also that "all employees who left to join the colors will be re-employed upon their return if they so desire," and that "present employees who have taken the places of those who left to join the colors, and who perform their duties to the satisfaction of their department heads, will be continued in the Company's service." This seems to us to be an eminently sagacious policy and quite in accord with the reputation that Capt. Barneson enjoys in this community. Presumably the market for the Petroleum Corporation's products will be good for the next two or three years, presumably also the corporation's employees will render better service if they know that the current rate of wages is established for a long period, and, lastly, they and their friends will appreciate the display of proper consideration for those that have served their country at the front. We commend this as an example to those that can afford to imitate it.

TO the older men in the profession the passing of Fraser & Chalmers is a notable event. This pioneer firm used to be easily first in the manufacture of mining machinery, and Mr. William J. Chalmers, still, we are glad to say, alive and well, was a personality of the first rank in the world of Western mining fully thirty years ago. When the firm was absorbed by the Allis-Chalmers Company, in 1904, it was still perpetuated by the English subsidiary company, which meanwhile had gained in importance, largely through the business done by its branch-office at Johannesburg. As Mr. Chalmers was identified with the American firm, so Mr. Walter McDermott was the personification of the British business. A public-spirited man of rare sagacity and good sense, he occupied a position second to none in the mining community of London and when he resigned as managing director not long ago, the event marked the changes that had supervened in the machinery business. The manufacturing plant at Erith, on the Thames, has been sold to the General Electric Company and negotiations are pending for the sale of the assets of the remaining branches in Canada, Australia, and the Malay States. This is likely to be followed by the liquidation of the company.

LAST week we quoted the latest casualty estimates, as published at Berlin and at Petrograd. We had hardly gone to press when new figures appeared in dispatches from Europe. The 'Cologne Gazette' stated that up to October 25 the German casualties were 6,066,769 and the dead about 2,000,000. The loss in officers alone—namely, 140,760, of whom 44,700 were killed—exceeded the total casualties of Germany in the war of 1870. Our disbelief in the low figure of 659,000 Germans killed is amply confirmed. The latest Russian estimate gives 9,150,000 casualties, including 1,700,000 dead, 1,450,000 permanently crippled, 3,500,000 wounded, and 2,500,000 taken prisoner. These figures are merely approximations, but they appear nearer the truth than the 3,000,000 given as 'dead' in the earlier report. The French are stated, in the Chamber of Deputies, to have lost 1,400,000 killed in the War. This appears probable; it may be compared with the British loss of 1,000,000 dead, not the 658,704 "killed in action", which did not include those reported missing who actually lost their lives, nor those that died at the front from disease. There is a wide difference between the various phrases used to express casualties. A later estimate gives 1,071,300 as the French killed in action, besides 760,300 deceased, prisoners, and missing, so that the total casualties, including the wounded, must be fully 3,500,000. The Italians claim 500,000 killed or died of wounds, out of a total of 2,000,000 casualties. The later total of 2,800,000 includes those taken prisoner. The Austro-Hungarian armies are reported to have suffered 4,000,000 casualties, of whom 800,000 were killed. This looks correct. The various countries have different methods of compiling these mortuary statistics, so that comparisons are difficult. In any event the loss of life tabulated by them does not begin to include all those that died on account of injury in battle and in the trenches, because many soldiers that have been invalided home have succumbed subsequently either to the direct consequences of their wounds or to the indirect results of an enfeebled vitality when attacked by minor diseases. The horror of war is not all on the battlefield nor even at the base hospital. The Central Empires appear to have lost about 3,000,000 in dead and 10,000,000 in total casualties, as against 4,500,000 dead and nearly 20,000,000 casualties of all kinds on the side of the four Allied powers, not including the United States, Belgium, Serbia, Rumania, and Greece. Apparently the Germans killed and wounded many more than their proportion, owing to the fact that they started the War so much better equipped in death-dealing weapons, although it is more than likely that their casualties are under-stated in order to placate domestic sentiment, now aroused to the criminal folly of their military enterprise. In any event, their responsibility for the great calamity is appalling. Germany and Austria face a terrible indictment at the bar of human justice.

Rossiter Worthington Raymond

On the last day of 1918 there died, at Brooklyn, New York, the most notable figure in the history of mining in America. Others may have directed bigger mining and metallurgical operations, others may have achieved a greater share of the success that is measured by money, others may have invented or designed a larger number of the methods or processes used in the winning of metals, but no man exerted so great an influence for so long a period of time as Rossiter Worthington Raymond—'the Doctor', as he was familiarly and affectionately known to the profession. In the adult portion of his 78 years of life he saw the development of the American mining industry from a mere beginning to a majestic maturity; and in that development he played a notable part by the help and stimulus that he gave to two generations of men. He was the comrade of Clarence King, J. D. Whitney, James D. Hague, S. F. Emmons, and that earlier generation of scientific men to whom we owe the application of geology to mining and the systematic exploration of the continental area that was thrown open to the prospector as soon as the railroad joined the East with the West. He was the guide, philosopher, and friend of the generation that followed, of many of the young men now directing the big enterprises of this country. He influenced the men that now influence others. When he was born, in 1840, the mining industry of the United States had made a feeble start; when he went to Freiberg in 1860 there was no mining school in this country; when he served in the Union army the discoveries of gold in California and of silver in Nevada had laid the foundation for the mineral development of the West; and when he was Commissioner of Mining Statistics, from 1868 to 1876, he gave a lead to the application of science to the art of mining in America. Long the dean of the mining profession, he has been its spokesman from a time as early as most of us can remember. In him a profession usually inarticulate found an eloquent exponent; through him the public learned to appreciate the breadth of culture that is required by an accomplished engineer. From his father, the editor of the New York 'Times', he inherited his ability as a writer and an expositor, an ability that he developed to an effectiveness unmatched in our profession, not only as a public speaker, but in the more systematic duties of lecturer on economic geology and of editor of two mining journals, notably the 'Engineering and Mining Journal', on which he collaborated for many years with Richard P. Rothwell. His abilities, however, were put to their maximum usefulness when he became Secretary to the American Institute of Mining Engineers in 1884. As editor, as organizer, as permanent executive, he managed the affairs of the Institute until his retirement in 1910, and so successfully that it became a national institution of the first rank. He brought his vivid personality so actively into play, he marked the Institute so strongly with his own identity, that for 25 years it might with truth and credit have been known as the Raymond Institute. This condition had the defect of its qualities and eventually called forth the need for reorganization, to which he objected so strenuously that the last decade of his life was clouded by a controversy in the course of which he became estranged from several of his best friends. But that disagreement is now placed in its true perspective and is remembered only as the manifestation of an exuberant egoism not uncommon in great men. He was a great man, an inspiring figure of a man. We like to think of him at the meetings of the Institute; how he would rise and look about him, then speak clearly, incisively, and humorously, making the rest of us seem a blundering lot of incompetents. He was the mainspring of those meetings; he saved the dullest from being a failure; he was ready for any exigency. This is not the occasion for touching upon the many other facets of his character: his legal career, for he was admitted to the bar; his church work, for he was superintendent of the sunday-school, teacher of a bible-class, and preacher at Plymouth Church, of his skill in many ways, from playing chess to writing stories—he was amazingly versatile; these aspects of his many-sided personality demand more considered treatment than is permissible here. He had the gift of leadership, winning the devotion of old and young, of men and women alike; he was kind to those in distress and generous to those needing help, whether mentally or financially; he was religious in a glad and unaffected way; he was a maker of fun and of happy hours; he was an inspiring companion and a beloved comrade. It is likely that many of his friends will desire to pay a tribute to his memory; we invite them to do so in our pages, which could be put to no more interesting or stimulating purpose. For ourselves we tender to his memory the homage of a fellow journalist, the respect of a fellow engineer, and the affectionate remembrance of a friend.

Potash

In our issue of December 7 we published a comprehensive article on potash by Mr. F. W. Brown, and in our last issue we printed a letter on the same subject by Mr. Herbert Lang, who knows how to write interestingly on many phases of mining and metallurgical activity. He finds fault with the attitude of the Government toward the potash industry and lays emphasis on the fact that our domestic production represents a small fraction of the consumption, which is growing rapidly and continually. Even the stimulus given by war prices and war industry failed to bring forth anything like the quantity required. Since the cessation of hostilities the quotations for potash have dropped to $4 per unit on a 35% K_2O product, as against a maximum of $6 last year and a price of 80 cents per unit, or $38.40 per ton, for German potash before the War. In regard to the Searles Lake operations, we are glad to think that the American Trona Corporation has begun to justify the expectation of its promoters. There are two plants at work at Trona, that of the Boro-Solvay Company, about which we have no definite knowledge, and that of the Trona Corporation, which during 1918 will have shipped 23,000 tons of crude salts, containing about 13,000 tons of potassium chloride, as the first fruits of an investment of between two and three million dollars. The seaweed idea is dead already, the cost of harvesting being prohibitive. It is unlikely that the deposits of leucite and alunite, in Wyoming and Utah, for example, will prove important sources of potash, because it it impracticable to extract both the aluminum and the potash from the same ore. It may seem simple to roast an alunite ore at a temperature sufficiently high to reduce the aluminum sulphate to alumina, leaving the potash as a soluble sulphate, and then to dissolve and separate the potash from the alumina. In practice, however, it is found that it is impossible to recover all the potassium sulphate, leaving enough to render the alumina of no value commercially. Apparently the exploitation of leucite ore presents similar difficulties. On the other hand, recent experience indicates that the recovery of potash as a by-product from cement works will afford an important source of supply, more particularly when the clay from which the cement is manufactured contains decomposed feldspars. It might be suggested that alunite be used as part of the mixture in cement manufacture, but when this is done, owing to the high temperature used in the burning of cement, the small particles containing the potash are not caught on the filters but pass through the stack. Much useful research has been done in response to the demands created by the cessation of imports during the War and the foundations of a valuable domestic industry have been laid, but it is obvious that if the German products are again permitted to enter this country free, after the treaty of peace has been signed, there will be no chance of a survival of our potash industry. Is it not advisable to render this country independent of the Kali Syndicate?

Alaska

Alaska is a beautiful country and the photographs that we publish in this issue bear testimony to the fact. Alaska is also a health-giving country, as those who have sojourned there know full well. The interior, or 'inside', beyond the coast range, enjoys a comparatively dry and extraordinarily vitalizing climate. In days to come this part of the world will be recognized as a sanitarium for those in need of a tonic. To be in Alaska is to feel that "the world is young and life an epic." We are glad therefore to endorse the suggestion of the writer of the article on the Kennecott district and to commend this region to the attention of the young men of the profession, especially those returning from the War and unwilling to resume the humdrum existence of ordinary routine. To the young man with a little money, some knowledge of mining, and a lot of energy there is no better occupation today than exploratory work in the North. The official statistics show that in 1918 the mines of Alaska produced $28,900,000, thus the output was $12,000,000 less than in 1917, but it is not due to exhaustion of resources but to the adverse effects of the War, chiefly shortage of labor and shipping. The production of gold was only $10,000,000, as against $14,671,400 in 1917, and of last year's yield $6,100,000 came from the placer mines. Copper is the principal product of Alaska at this time, the output having been 69,426,000 pounds, worth $17,180,000 during 1918. We note that the tin production was valued at $90,000, this serving as a reminder of one of Alaska's potentialities. Since 1880 Alaska has produced $302,000,000 in gold and $105,800,000 in copper. The figures are impressive. For this territory the United States paid Russia the sum of $7,200,000 in 1867. It is an enormous region, not less than 514,700 square miles, with a population of barely 50,000, most of whom are collected in a number of small communities, leaving large tracts uninhabited and hardly explored, although any mention of exploration prompts instant recognition of the splendid work done by the U. S. Geological Survey under the leadership of Mr. Alfred H. Brooks, whose many reports and bulletins are of the utmost practical value to those engaged in the search for deposits of ore. Anybody going to Alaska can obtain maps and other information of the most helpful kind simply by writing to the Director of the Geological Survey at Washington. No mining region has been so well served in the matter of geological reconnaissances and reports, all of which are available either gratis or at a nominal price. Besides giving this geologic aid the Government has undertaken to build a railroad, which will traverse the coast range and reach the interior through the Broad Pass. We publish an article by Mr. F. LeRoy Thurmond detailing mining activities in the vicinity of this mountain pass and showing the district to be rich in minerals, including stibnite. It covers a portion of the line of contact between the sedimentary rocks and the granite intrusions along which the orebodies of Alaska and British Columbia are chiefly distributed. The Government Railroad has its principal terminus at Anchorage, on Cook Inlet, although the outer rail-head is at the harbor of Seward, on the Gulf of Alaska. It taps the Matanuska coalfield, the Kenai, Willow Creek, and Talkeetna goldfields; it will serve the Nenana coalfield, as well as the gold-mining districts and the agricultural tracts in the Tanana valley. This railway will afford direct entry into the heart of Alaska, instead of necessitating the roundabout journey either down the Yukon from White Horse or up that river from St. Michael. Another article, reviewing the mineral development of Alaska during 1918, by Mr. J. L. McPherson, affords an excellent idea of the various mining activities now in progress. The finding of palladium in copper ore near Ketchikan and of platinum on the Seward peninsula emphasizes the possibilities of this remote part of the continent and should provoke further search for the rare metals. The exploitation of tungsten and chrome deposits has been stimulated by the War and may lead to something permanent in case the ore is rich enough to overcome lower prices for the ferro-alloys. Juneau has suffered by the closing down of the Treadwell group, except the Ready Bullion mine, owing to the caving of the surface and the drowning of the workings. Another blow to the Juneau district has been the failure of the Alaska Gold and Alaska Juneau enterprises, although there is good reason to believe that, thanks to the courage and persistence of Mr. F. W. Bradley, the latter failure may yet be retrieved. One of Alaska's chief assets is its coal, the exploitation of which has been hindered by political and other troubles, but is destined to prove an important factor in the industrial development of the Pacific Coast. We are glad therefore to note the recent work done on the Nenana, Bering River, and Matanuska coalfields because it appears to indicate a renewed effort to develop these resources. Any consideration of Alaskan mining makes clear the great variety of mineral deposits distributed over this enormous region and justifies our drawing attention at this time to a part of the world for which, by reason of personal experience, we have a warm spot in our heart.

The War Minerals Meeting at Washington

By COURTENAY DE KALB

The problems of the producers of war minerals has assumed a new phase. The War Minerals Act (Public 220) still stands on the statute books unused, and the Secretary of the Interior has definitely stated that it could be employed, but that he will not do so without the express direction of Congress. This admission was made to a committee from the meeting of the manganese, chrome, pyrite, and magnesite producers assembled in Washington under the auspices of the American Mining Congress on December 16. The committee consisted of W. L. Gazzam of Seattle, J. A. Edwards of Los Angeles, and Nelson Franklin of Denver. Secretary Lane expressed sympathy with the producers in their predicament, and said that while the Act was, in his opinion, technically and legally effective, he felt that further authorization to apply it was needed to warrant his taking such steps as administrator. He had not consulted the Attorney General, but the matter seemed clear without soliciting his advice. If Congress should direct that he administer the Act he would welcome the opportunity, although he would prefer to make use of the appropriation granted in the Act for the purpose of liquidating the losses incurred by the producers. He was willing to express these opinions to senators and representatives who might confer with him.

The Act would have to be amended to enable the appropriation to be utilized in that manner. It is well understood that no new appropriations relating to war-work can be passed at this Congress. At least a decided change in congressional opinion will have to come about if such legislation can be secured. The Chairman of the Appropriations Committee of the Senate, Thomas S. Martin, has set his face determinedly against any further appropriations, owing to the critical attitude of the Republican members. Therefore any effort at relief must take advantage of appropriations already made. The fact that the Minerals Control Act carries an appropriation of $50,000,000 makes it available if it can be suitably amended. It is assumed, on the strength of statements made by many members of the Senate and the House, that this will not be extremely difficult to accomplish, since there is a growing sense that the Government must find means for relieving those who have suffered by reason of unfulfilled contracts that were entered into before the armistice was arranged. The War Department has taken the initiative in providing for payments on the so-called verbal contracts, which the Comptroller of the Treasury declared could not be settled legally under existing laws. At the instance of Secretary Baker the Department put itself squarely on record through a letter to Chairman S. H. Dent of the Committee on Military Affairs of the House, in which he said: "The signing of the armistice has left numerous persons and corporations engaged in supplying or preparing to supply the war needs of the United States at the request of the War Department, without contracts covering the service to be rendered by them executed in the manner required by law. . . . Yielding to the exigencies of the war situation, such contractors put the work of production ahead of the work of negotiation, and have often put themselves in a position where their only reliance was the good faith and fairness of the Government in finally fixing the terms of the agreement. . . . Under all the foregoing classes of cases the contractors have, at the request of the United States and in response to the needs of the war emergency, made expenditures and incurred obligations in preparing, or actually entering upon, the task of supplying the war needs of the country. They have a part, and in many cases an essential part, of their working capital tied up in the expenditures they have made in preparing to begin work, in the creation of facilities, in actual materials purchased, wages paid to labor employed, or in work in process. In order that this working capital may be returned to them so that they may as speedily as possible go into commercial work, it is essential that there be a prompt adjustment under these informal or implied agreements. In this matter time is of the essence. To effect such adjustment . . . it is necessary . . . to secure the remedial legislation now proposed. Contractors who have had formal written contracts should not be penalized for the reason that it now develops that the Chief of the Procurement Division of Ordnance could not deputize his principal assistants to sign a contract. Nor should the patriotism be penalized of those who in the exigencies of the war have gone ahead to produce instead of waiting to bargain. It is true that such persons have nothing to rely on except the good faith of the United States, but surely there should be no more solid ground for reliance than that good faith."

In accordance with this representation to Congress the Dent Bill (H. R. 13,274) was introduced and has been reported from the Committee favorably, on December 19, and is expected to become law within a short time. Friends of the mineral producers have not been slow to see in this bill the full recognition of the moral principles involved in the Government requests for chrome, manganese, and other materials coming under the provisions of Public 220, and while a separate measure for the relief of the minerals producers will be introduced* without delay, it is certain that the Dent Bill will not be permitted to pass without being amended so as to include the implied contracts in the case of the miners of chrome, manganese, and other materials, unless the amendment to the War Minerals Act should be passed first.

---

*This has been done. We gave the text of the bill in our last issue.

The meeting of the American Mining Congress for the benefit of the producers of the war minerals was largely attended. Fifty-five representatives of the interests involved were present, coming from 22 States. They held credentials from over 1000 producers, employing in the aggregate about 200,000 workmen. A permanent War Minerals Division of the American Mining Congress was organized, and an executive committee was appointed consisting of the following persons: Theodore Swan of Alabama, A. J. Edwards of Arkansas and California, W. W. Pettis of Montana, and J. C. Jensen of Utah, representing manganese; W. L. Gazzam of Washington and Oregon and Courtenay De Kalb of California, representing chrome; N. P. Pratt of Georgia, representing pyrite; Nelson Franklin of Colorado, representing tungsten; and H. F. Wierum of Washington, representing magnesite. On the return of Mr. Gazzam to Seattle his place was taken on the committee by Walter H. Denison of Arkansas, acting as a substitute. This committee has been active since the adjournment of the convention in framing the desired amendment to the War Minerals Act, and in arranging to have it introduced into Congress through the Committees on Mines of both houses. It will be noted that the potash industry is not represented, and in fact no potash representatives were invited, but provision was made by a motion carried by the convention for increasing the executive committee by additions to its membership consisting of the representatives of other interests affected, and thus the alliance of the potash producers is made possible. As they are equally injured, and as they represent large investments, their addition is of great importance for adding strength to the petition to Congress.

The convention adopted the following resolution:

Whereas, on October 5, 1918, H. R. 11,259 (Public 220), was approved by the President, and

Whereas, on November 11, 1918, the day on which the armistice was signed, the administration of this Act, with the exception of the imposing of duties, was turned over to the Secretary of the Department of the Interior by the President of the United States, thereby indicating his intent to have the provisions of the Act carried out, and

Whereas, up to the present time none of the provisions of the Act have been carried into effect, and

Whereas, American producers of the minerals specified therein, who were induced to invest large sums of money for the purpose of producing such minerals under the implied protection of the Act, have suffered serious losses, and will continue to do so, and in many cases will be financially ruined by reason of the non-enforcement of said Act; now therefore be it

Resolved, by this convention of mineral producers, constituting the War Minerals Division of the American Mining Congress, assembled in the City of Washington, December 16 and 17, 1918, that the Congress of the United States be and hereby is requested to take such legislative action at its present session as it may deem proper to enforce the carrying out of the purpose and spirit of the aforesaid Act so that justice may be done.

It is evident from the foregoing resolution that the sense of the convention was that the Act as it stands ought to be administered. The addresses of delegates from all over the country distinctly maintained the importance of doing more than to merely redeem the losses incurred. They felt that they had made a contribution to the welfare of the country that should not end with the fulfilment of their duty in providing necessaries for the national emergency just passed, but that the purpose and spirit of the Act should be broadly interpreted as meaning that the production of the minerals mentioned therein should be continued "to provide further for the national security and defence." They felt that the United States, having once been caught in a dangerous position because of our reliance upon imported minerals, it was our duty to make ourselves secure for the future by sustaining these new industries as part of a rational and necessary program of preparedness, both from an industrial and a military standpoint. It may be said that the opinion is growing rapidly that the academic position of the Democratic party with regard to free trade must yield, and that the leaders of the party are beginning to perceive that a change of policy is necessitated. This opinion is spreading, without reference to sectional lines, and the Southern delegates to the mineral convention were as emphatic in their declaration for protection to the chrome and manganese industries as were those from other parts of the country. The producers of pyrite, magnesite, and tungsten insisted that, while liquidation would be accepted, they believed that protection should be accorded to comply with the true spirit of the Act which was passed for their benefit. Mr. Wierum showed that this country now had developed sufficient deposits of magnesite to supply domestic needs for years to come, and that if the industry should be allowed to languish, this material would be supplied again, as in the past, from the mines of Austria. Over two millions of dollars had been expended in preparing the magnesite mines of this country for production, and more than 2000 workmen had been employed until recently. J. C. Jensen also held that it was our duty to maintain the industrial independence of America with regard to pyrite, and N. P. Pratt pointed out that the Chestatee mine in Lumpkin county, Georgia, had enormous resources of pyrite developed, at a cost of $850,000, which was superior in quality to the Spanish ores. The Chestatee pyrite is entirely free from arsenic, averages 46% sulphur, and contains in addition approximately 1.75% copper, and $2 in gold per ton. Theodore Swan of Alabama, representing the Primos Chemical Co., called attention to the fact that the chief difficulty experienced in the maintenance of an American manganese industry lay in the competition from England. The English makers of ferro-manganese have been accustomed to supply this market to a large extent, and can deliver the ferro-alloy at $60 per ton. This is made possible by the fact that manganese ore coming from India in ballast can be laid down at British ports at about $3 to $4 per long ton. The costs of labor and reduction in this country make it impossible to produce the ferro-alloy for less than about $150 to $160 per ton. The conversion cost in the electric furnace, he asserted, was about $100 per ton of ferro, with the volatilization and slag losses averaging close to 20%. At the present time, he estimated, there were stocks of ferro-manganese in the hands of the steel-makers sufficient for three to four months, and the total stocks in the country were adequate for eight months. With the ores now available it would be possible to go through another year without having to buy a single ton of ore. Dr. C. K. Leith estimated that the supply might be sufficient for even 14 months. Mr. Swan said that his company "had a lucky hunch some time ago," so that its stocks of manganese will be exhausted by next February. He did not explain how nor where this "hunch" was obtained. Frank D. Brown described the conditions of manganese mining at Philipsburg, Montana. He and many of his friends had been induced to embark in the production of manganese after conferences with Government representatives who gave them assurance of Government protection. In the beginning they experienced difficulties on account of their newness in the business, and losses were met through failure to adhere to the specifications of the buyers. Heavy penalties were imposed, in one case as much as $900 being paid for excess silica on one carload. These problems were solved, and concentration supplemented careful hand sorting. The work of development and the erection of plant absorbed all the profits in the Philipsburg mines, so that the signing of the armistice left them just ready to realize some fair return for their money. They were, consequently, serious sufferers, and not only did the operators feel that they were entitled to consideration, but large numbers of miners who had been attracted by the new enterprise at Philipsburg were left without work at the beginning of winter, and many of these would undergo severe hardships unless the work were permitted to go on.

A ringing address was given by W. H. Denison of Cushman, Arkansas, which produced a profound impression, not only upon the delegates to the convention, but, by their own confession, upon the senators and representatives present, who had come to gather a better idea of the situation of the producers of the war minerals. He had been called to Washington when a shortage of manganese was feared, and was induced to develop his properties and to persuade others to enter into the business. As a result a total of $1,038,000 had been expended in one district alone, of which $263,000 had gone into plant for dressing the ores. Only 4830 tons had been shipped when the market fell, but 60,000 tons is in sight ready for delivery next year. The closure of the mines in his district had thrown 1400 men out of employment. While the miners of Arkansas had lost nearly their entire capital, the shippers of Brazilian manganese had paid in export duties to that government $1,500,000, and their profits were estimated at $30,000,000. If the American producers had been permitted, by proper protection, to produce so as to make that much profit, they would have paid to our Government in taxes $18,000,000, in addition to providing our steel furnaces with their requirements and giving remunerative employment to thousands of workmen. If the American producer was not to be protected in the industry that he was encouraged to initiate, he was at least entitled to have been warned of the growing stocks of manganese so that he might have ceased operation and have saved the waste of his capital. Now that the damage has been done there is but one way to do justice and that is to discharge the obligations of the Government even if it should cost as much as to have fought on through two more years of war.

As a matter of fact the estimates of the amount required to liquidate all the producers of the war minerals is variously placed at from $15,000,000 to $25,000,000. It is understood that the estimate of the Bureau of Mines is as low as $5,000,000. This is undoubtedly short of the truth. Chrome will absorb as much as $1,000,000 for liquidation; manganese is stated by prominent producers to require for this purpose at least $7,000,000; pyrite will take about $1,000,000; magnesite $2,000,000; tungsten as much more; and potash probably $4,000,000. These are crude estimates, but beyond doubt the sums needed will be so large that it would appear sounder as a national policy to frankly accept the plan of protecting and encouraging the industries for the general good of the country. In effecting any settlements under a plan for liquidation it has been pointed out that the Government will necessarily demand the right to make salvage as far as possible. This will raise the question of disposal of equipment and of ores acquired in the process, which in turn will lead to a consideration of disposal. The Act as it stands provides for this under protection of the price, and it is an interesting problem as to how liquidation can be made without calling into action the provisions of the measure as originally passed. These are details that must be taken into consideration by Congress.

The convention of mineral producers has resulted in giving impetus to the movement for Congressional action to relieve the distress occasioned by the failure of the Government to put the Act into effect at the proper time. In view of the situation that arose during the autumn, and considering the fact that the War was still in progress after the break in the market for chrome and manganese occurred, and that the Minerals Control Bill was signed by the President on October 5, delay to utilize it then, when there could have been no question as to propriety of doing so, increases the responsibility of the Government through negligence to do what Congress had intended for the protection of these industries.

SILVER MELTED in a Rennerfelt electric furnace at the Philadelphia Mint during the fiscal year 1917-'18 amounted to 10,031,101 oz. It takes 60 minutes to melt 1000 lb. (12,000 oz.), consuming 198 kw-hr. per net ton.

Minerals Separation Litigation

Two new petitions have been presented to the United States Supreme Court by the Minerals Separation North American Corporation in its litigation against the Butte & Superior Mining Co. One of them constitutes a motion to advance the case, while the other seeks to restrain the Butte & Superior company from disposing of its assets pending action in the matter.

In motioning that the case be assigned for argument at an early day the Minerals Separation company says that "this suit not only involves a patent which has been heretofore passed upon by this (Supreme) Court but the respondent, Butte & Superior, carried on in its mill, by its employees, with its own ore and for its own profit, the acts formerly adjudicated by this court to be infringements. . . ."

The petition then says that the Butte & Superior Co. varied its procedure and process in an immaterial respect, after the Supreme Court rendered its decision in the Hyde case; that the District Court on the basis of that decision, held the variation immaterial and that the infringement had continued; and that the Circuit Court of Appeals reversed this holding as to continuing infringement, on the sole basis of its different interpretation of the Supreme Court decision in the Hyde case. This, the petitioner charges, voided and rendered practically nugatory and valueless, the invention which the Supreme Court pronounced to be patentable, thereby opening the way for the use and enjoyment of the invention without liability to the owners.

"The point at issue," charges Minerals Separation, "is whether the decision of this (Supreme) Court in the Hyde case, properly interpreted, permits such a limitation to be given the patent as to enable the respondent, Butte & Superior Mining Co., to obtain the benefit of the patented invention and escape infringement."

In asking for an injunction restraining the disposition of assets and payments of dividends Minerals Separation claims that from reports formerly filed with the District Court by the Butte & Superior, that company's operations from November 1, 1913, to and including December 31, 1916, show that "in these admitted and adjudged infringing operations the total value of concentrates recovered was $18,970,876, the total cost of the operation of the flotation plant was $1,136,452 and that therefore the profit of the infringing operations was $17,834,423, or about $18,000,000." Dividends paid total $16,940,258.

The Butte & Superior company has depostted with the District Court as security for the Minerals Separation, a surety bond for $75,000 and $100,000 in Liberty bonds against $18,000,000 of profit "made by the defendant in operations unquestionably infringing the patent in suit," the total security being less than 1% of the profit.

As another reason for desiring a restraining order preventing the dissipation of assets, the Minerals Separation company refers to two diverse decisions against Butte & Superior secured by Elm Orlu Mining Co. in its litigation for title to a "substantial portion of its mine."

The Passing of a War-Industry

By F. H. MASON

The notice by the Hercules Powder Co. to its employees that its plant at Chula Vista, near San Diego, will be dismantled gradually brings to a close an exceedingly interesting piece of chemical research. After a futile endeavor to find a market for its output at post-war prices the company has decided to close the plant. The fact that in the month since the signing of the armistice the prices of the principal products, acetone and potash, have dropped respectively from $15 to 75c. per gallon and from $400 to $100 per ton shows clearly that the company had no alternative in its decision.

The plant was designed and built in order to fill a contract that the company had made with the British government for a large quantity of cordite, the understanding being that in filling this order the company should not compete against the British government in the purchase of acetone derived from the then existing sources of supply of that material. In other words, the company should find some new source from which to derive its acetone to fill the order. Cordite, it may be mentioned in passing, is the principal propellant used in the British army. It is a mixture of 65% gun-cotton and 30% trinitro-glycerine blended by the common solvent acetone. Five per cent of vaseline is added to stabilize the explosive and lubricate the guns, and then the acetone is made to volatilize in heated rooms.

The Hercules Powder Co. turned to the kelp fields off the coast of southern California for its supply of acetone. The kelp was cut and macerated and stored in huge harvesters that were kept continuously at work, barges being in attendance to take the kelp from the hold of the harvesters to the works. From the barges the kelp is pumped to 50,000-gal. redwood tanks, of which there are 150, where it is maintained at the proper temperature for fermentation by steam pipes and agitated by compressed air. Fermentation proceeds for 10 to 14 days, the products being acetic, butyric, and other organic acids, which are converted into calcium salts by the addition of lime. The undigested kelp is screened from the solution, containing the calcium salts, together with potassium chloride, iodide, and other salts that have been released from the kelp by fermentation. The solution is filtered, evaporated, and the various salts separated by fractional crystallization and other means. The acetone, of course, is derived from the calcium acetate.

Such is a brief outline of an industry made possible only by the exigencies of war. It represents a capitalization of $5,000,000, and it steadily employed from 1000 to 1500 men, while it retained from 15 to 20 chemists on the research staff to solve difficulties that were continually arising. The plant was started in the fall of 1916, so, by the time it is closed, it will have run, perhaps, two and a half years. During the last year, it has cut and treated on an average 24,000 tons of kelp per month. Besides acetone and potassium chloride, a number of by-products were made, all of which were in good demand.

MOTOR-ROAD TO STRELNA

THE KENNECOTT MILL

Alaska's Mineral Development During 1918

By J. L. McPHERSON

Introduction. The arrival of 135 ounces of platinum, valued at $13,577, from Alaska, during November of this year, marks not only the first shipment of that metal from the Northland but anticipates the opening of a new and promising industry for the territory. The platinum comes from widely separated localities; five ounces from the Salt Chuck mine in the Ketchikan district; six ounces from Slate creek in the upper Copper River region; and 22 ounces from Dime creek on the Seward peninsula. The first shipment was from a lode deposit; the second, from a placer.

Despite the shortage of labor and transportation, the high cost of materials and supplies, prohibitive to the mining of low-grade deposits, mining development in Alaska, during 1918, showed material progress in the opening of many new properties and the enlargement of plant and equipment.

The most striking instances of new development include the opening of the molybdenite property by the Alaska Treadwell company on the northern end of Prince of Wales island; the starting of a tunnel to connect the workings of the world-famous Bonanza mine with the Mother Lode property and the enlargement of the Kennecott plant for the treatment of tailings; the completion of an auto-truck road, 20 miles long, connecting the mining property of the Alaska Copper Mining Co. at Nugget Creek with the Copper River & Northwestern railroad at Strelna; the erection of a mill on the gold-mining property of the North Midas Copper Co. on the Kuskulana river; increased production in the Willow Creek quartz-mining district, which had its most prosperous year; and the discovery that the minerals in this district carry platinum.

South-Eastern Alaska. The molybdenite deposit at Shakan is being extensively developed by the Alaska Treadwell Mining Co., which has installed a 20-stamp mill and has a 4000-ft. tramway under construction to connect the mine with the wharf. It is reported that 100,000 tons of ore is in reserve. The company has erected at Treadwell a Heroult electric furnace for making ferro-molybdenum.

The Pacific Gypsum Co. has re-organized with sufficient capital to operate its holdings at Gypsum on a large scale. Dockage facilities will also be added to accommodate Japanese freighters.

The Salt Chuck mine at Kasaan has been operating. successfully, the first copper concentration plant to be installed in the Ketchikan district. The plant has a capacity of 60 tons per day and consists of a Blake crusher, ball-mill, drag classifier, followed by flotation rougher and cleaner cells.

The Rush, Brown, Sulzer, and It mines are shipping steadily and supplying considerable ore to the smelters.

The Alaska-Endicott Mining & Milling Co. has constructed approximately 800 ft. of tunnel and has cross-cut an 18-ft. vein on the property. A strong vein of ore continues in line with the tunnel. The Jualin gold mine, situated about 60 miles from Juneau, will resume operations at capacity with the opening of the 1919 season. It is estimated that 100 men will be employed. The mine has not been operated since 1917.

The first consignment of copper ore was shipped from the Rainy Hollow district this fall, when Kennedy, Conway, and Burnham sent 26 tons of bornite south from the Maid of Erin mine by way of Haines.

Other operations in the south-eastern part of the Territory include the construction of a plant for the treatment of a complex copper-zinc-lead ore by the J. L. Harper syndicate at Moira Sound; the discovery of a free gold and galena deposit at Windham bay; and the operations of the Alaska Copper Co., which has sunk 200 ft. below sea-level at Port Esterly, cross-cutting a vein of shipping and milling ore for 15 ft. The ore carries copper, silver, and lead. Development work has continued on the nickel properties on Chichagof island. Exploration underground is progressing on the Alex group at McLeans Arm.

The Alaska Treadwell Mining Co. is hoisting ore from the 2800-ft. level of the Ready Bullion mine on Douglas island. This is the lowest level ever attained in Alaska. The Alaska Gastineau, at Thane, has undertaken no new development work this year on account of the shortage of labor and the high cost of operation. During September the mine produced 47,850 tons of $1.247 ore, or just half the August tonnage. At the end of the second quarter, the estimate of broken ore in the stopes was 1,901,394 tons. The Alaska Gastineau added a second shift during November and contemplates operating three shifts in the near future.

F. W. Bradley, president of the Alaska Juneau Gold Mining Co., states that the company is preparing to operate 45 drills on this property next year, which means a greatly increased output, for the handling of which plans are now being completed.

Copper River. The Kennecott Copper Corporation has been employing about 550 men at the highest wages ever paid by quartz or lode properties in the Territory. Still, they have been obliged to work short-handed. This company has been operating the Jumbo and Bonanza mines and recently acquired the controlling interest of the Mother Lode property. To connect the Bonanza and Mother Lode workings, a tunnel 1400 ft. long is under construction, through which ore from the Mother Lode will be brought to the Kennecott mill, resulting in a great saving in transportation from the present system of hauling by auto-truck from the mine to McCarthy on the Copper River & Northwestern Railroad, a distance of 12 miles. The Kennecott company is enlarging its plant for the treatment of the tailing by an ammonia process perfected by E. H. Stannard, manager for the Kennecott Corporation.

Important discoveries of silver, lead, gold, and a large body of low-grade copper ore have been made during the year in the Chitina region. The North Midas Copper Co. has constructed a cyanide mill for the treatment of its gold-bearing ore. This property is situated on the Kuskulana river about 14 miles from Strelna on the Copper River & Northwestern Railroad.

The Slate Creek placer district, which has been a steady producer for the last 18 years, had its most successful season in 1918. Through the receding of a glacier in this district, a gold-quartz vein about four and a half feet wide, and carrying rich ore, has been exposed for several hundred feet.

The Alaska Copper Corporation has developed its bornite deposit on Nugget creek in the Kuskulana valley to a depth of 300 ft. A 50-ton experimental concentrating mill has been constructed this season and will be enlarged next year. Ore will be transported by auto-trucks over a new road, 20 miles long, constructed by the company from the mine to Strelna, on the railroad.

Prince William Sound. The copper mines in Prince William Sound district have all been greatly handicapped by lack of transportation facilities, due to the governmental order requiring steamship companies to care first for fish products. The Granby Consolidated Co. has constructed an aerial tram, 28,360 ft. long, from the Midas mine to tide-water on Valdez bay. This is the longest tramway in Alaska. It is divided into six sections with 77 towers. The longest span is 3080 ft. The cable for the loaded skips is 1¼ in. diam., and for empties, ¾ inch. Eighty buckets of 1000-lb. capacity each are in use. The cost complete was $3.66 per foot; cost of operation, 0.328 cents per ton. The company produced 11,860,679 lb. of copper during the first quarter of 1918.

At Harriman Fiord, in the Port Wells district, the Free Gold Mining Co. has carried on considerable development work including a 500-ft. adit, and has installed a small Gibson mill and an air-compressor. The company has handled some rich free-milling ore this year.

Susitna Valley and Kenai Peninsula. Discovery of platinum on a tributary of Squentna river, the development of chrome ore properties at Port Chatham, the operations of the Cache Creek dredge, and general activity in the Willow Creek district characterize the mining season in the Susitna valley and Kenai peninsula this year. Platinum is believed by Dr. Herschel Parker to be available in commercial quantity in the Susitna valley.

Whitney and Lass are making regular shipments of chrome ore from their properties at Port Chatham. Geologists of the U. S. Geological Survey report the Red Mountain chrome deposits to be the best in the United States.

In the Yentna district, the Cache Creek Dredging Co. employed 45 men and had a successful season. The dredge was operated with coal secured from a near-by mine belonging to the company.

The Willow Creek quartz district has experienced the most successful season of its history, the yield this year exceeding that of last by about $100,000. The Miller-Straub people have erected a stamp-mill and have made a test-run, which was successful. The mills of the Gold Bullion, Alaska Free Gold Mining Co., and the Mable have operated at a profit during the past year. A small crew of men is mining free-milling ore at the Chase property on Turnagain Arm, where Mr. Chase is arranging for the erection of a prospecting mill to enable him to give the ore a thorough test.

The Valdez Placer Mining Co. has completed a large hydraulic plant on Valdez creek near the headwaters of the Susitna river and is prepared to begin active operations at the opening of next season. W. W. Woodward is installing a dredge in the Kachitna district. C. H. Packard is prospecting a graphite deposit at Red Bluff, on Seldovia bay. Extensive deposits of magnetic ore have been discovered by Henry Emard at Snug Harbor.

ESKA MINE, IN THE MATANUSKA COALFIELD

LOADING COPPER ORE AT KENNECOTT

Fairbanks. In spite of labor shortage, about $1,000,000 in placer gold is predicted as the output from the Tolovana this year. At least 30 plants are at work, employing between 250 and 300 men. New gold-placer strikes have been reported at Takotna, on Crooked creek, George river, and Holitna river. Molybdenite has been discovered about 100 miles from Fairbanks in the Delta country. The mining season at Fairbanks bids fair to equal, if not surpass, the output of last year.

One hundred tons of ore from the Smith-McGone mine, recently milled at Eva creek, yielded $1875 in gold. The company has an additional 250 tons of the ore to mill and expects to operate all winter. Recent arrivals from Brooks report a quiet stampede to Washington creek, nine miles from Olnes. Thirty tons of silver-lead ore shipped from the head of Cleary creek averaged $45 per ton. Ground yielding better than $1 per foot in placer gold and carrying a considerable quantity of placer tin has been discovered on lower Patterson, about 22 miles from Hot Springs, which is 40 miles from Nenana.

Numerous strikes are reported from various parts of the district. Vaughn and Fox are reported to have made a copper strike near the head of the Maclaren river in the Susitna watershed. Smith Brothers have struck a new vein on their quartz property on Easter creek. J. C. Murphy has been working his tungsten property at the head of Pearl creek. U. G. McDowell and L. J. McCarty have taken a lease on the McCarty quartz property on Fairbanks creek and expect to treat their ore at the Gilmore mill.

Upper Yukon, Koyukuk. Production in the Koyukuk and Upper Yukon is not expected to equal that of former years. In the vicinity of Circle and Eagle several hydraulic plants are in operation or are completing development work, preparatory to hydraulicking next season. Circle, Alaska's old reliable placer camp, has had one of the most prosperous seasons of its history; several new hydraulic plants have been started in the district; the six-mile ditch on Dome creek has been enlarged and a new dam completed.

Kuskokwim. Gravel richer than $1 per foot is said to have been uncovered at Greenestone on the Tolatna. $80,000 was taken out of Flat creek in the Iditarod district this season. Boland and Hansen on Wetketchum creek report better than average pay, while Arndt and Nelson on the same creek, report as high as $5 per foot. 'Smiling' Albert is said to have struck it rich on Nixon fork, a tributary of the Takotna, by uncovering $1 pans from six feet of gravel in a 60-ft. hole. Good pay is also reported from Moore creek in the Kuskokwim. News of a good strike was reported early in the year by a native named Wattemuse (or Watermouse) in the Good News Bay district. Later reports state that pay was found on only three claims. Six outfits are operating approximately 125 men on Willow creek in the Marshall district.

Seward Peninsula. Shortage of water has been keenly felt by the operators in this region. The introduction of the Miles system of thawing to replace the old steam method, was tried effectively by the Alaska Mines Corporation in the Candle section this year. Tin-dredging has been carried on successfully in the Port Clarence section on Lost river. Sixty tons of ore was recently shipped from the tin mines at York to the States. Dime creek has been one of the most active mining centres in this district. Olaf Nelson reports a gold strike with uniform pay on California creek, which is in the Shungnak section of the upper Kobuk and within the well-known gold-bearing areas of that river and its tributaries. H. L. Stull has bought a Keystone drill and will prospect for old pay-channels in the Inmachuk district. Chandler and Dawson, from New York, have been drilling on the Inmachuk properties of the Fairhaven Ditch Company.

Coal Development. The first shipment of coal, a small consignment from Lignite creek, reached Nenana from the Nenana coalfield early in February. The Alaska Anthracite Railroad, under construction from Controller bay to the coal property of the Alaska Petroleum & Coal Co., was completed to tide-water at Bering river on October 7, and will permit of the shipment of high-grade bituminous and anthracite coal. It is planned to extend this railroad seven miles from Okalee channel on Controller bay, which will allow of direct loading onto ocean carriers. The Bering Coal Co. has taken a lease on the Bering coalfield and has a large force engaged in extensive development work. In the Matanuska field, the Alaska Engineering Commission is employing 150 men at the Eska mine, which is producing 100 tons daily for use locally. Forty men are employed at the Chickaloon mine in development work. The Chickaloon Coal Co. is pushing drilling and other exploratory work on its leases, which are adjacent to Chickaloon. The Alaska Engineering Commission recently let contracts to R. E. Burns & Co. for the delivery of 5000 tons of Nenana coal, to be mined from a deposit 49 miles south of Nenana; and to W. J. Lynn, for 1000 tons from a deposit 29 miles south of Nenana. This marks the beginning of real development of Alaska's great interior coalfields.

The Shakan Molybdenite Mine

Near the north-west end of Prince of Wales island, at a navigable distance of 180 miles from Treadwell, Douglas island, Alaska, the Alaska Treadwell company is developing the Shakan mine.

The vein on this property outcrops for a length of over 500 ft., with an average width of 5 ft., and an average assay of 1% molybdenite. A tunnel being driven on the strike of the vein has now advanced a distance of 320 ft., and has developed the vein for an average width of 7.7 ft., with an average assay of 1.89% MoS_2. The average of the surface and underground showings is a width of 5.85 ft., assaying 1.58% MoS_2, indicating 100,000 tons, of which 6270 tons is positively blocked-out with an average of 2.28% MoS_2. This block alone should eventually yield sufficient profit to more than repay the whole cost of the operation. The average ore should yield 15 lb. molybdenum per ton, which, at the average price for the molybdenum content of molybdenite concentrate for the seven pre-war years—1908-1914 inclusive—would mean a recovery of $15 per ton of run-of mine ore.

At the time the option on this property was secured, there was considerable demand for molybdenite concentrate at a high price; but war prices afterward so stimulated production that the company has not yet been able to contract for an output of either molybdenite concentrate or for an output of ferro-molybdenum, a product planned to be made in the 2-ton Heroult electric-furnace at Treadwell. While war prices have resulted in overloading the market for the time being, the expectation is that the intensified advances forced by the War in metallurgy and in manufacturing, will eventually create a sufficient demand to absorb all the molybdenum production that is now in sight.

The Shakan ore is not only twice as high grade as that mined from the Climax molybdenum property situated at an elevation of 12,200 ft. above sea-level in Colorado, but it also promises to yield the metal vanadium and soluble phosphorous salts as by-products.—Excerpt from report of F. W. Bradley, October 1918.

Refining Gold Bullion With Chlorine Gas and Air

By R. R. KAHAN

*At the Royal Mint, Perth, Western Australia, a modification of the Miller chlorine process and Rose's method for toughening gold bullion by means of oxygen, gas, or air, is used.

It is a common experience for the refiner using Miller's process to notice that, with various classes of bullion, which contain only gold and silver, the final stages of the refining process occupy only a short time; whereas, with bullion which contains, besides gold and silver, varying quantities of certain base metals, such as lead, antimony, etc., the final stages of the refining process take a considerable time. It is in the final stages of the chlorine process that the major portion of the losses of gold occur. In the literature of refining bullion by chlorine gas, only brief mention is made of the stage of the operation when the losses of gold occur. Most of the losses of gold take place in the final stages of the refining process.

Various methods were experimented with to attain this object, the most successful being as follows: Two clay pipe-stems are introduced into the refining crucible. One is connected to an air-compressor delivering at a pressure of 6 or 7 lb. per sq. in., and the other to the chlorine generator. At the beginning of the refining operation the maximum amount of air is used, so much as will just avoid the globules of metal being projected through the borax cover, and a slow stream of chlorine. As the operation progresses the volume of air used is diminished, and that of the chlorine is increased, until finally, the air-pipe is removed and chlorine alone is used. The principle governing the regulation of the air and the chlorine is that fumes should be prevented from leaving the borax cover; if the fumes become too voluminous more air must be used and less chlorine.

When using this method it is found an advantage to mix the brittle bullion with the bullion containing the most silver. If the refining does not appear to be progressing satisfactorily, it is beneficial to remove the borax cover, and replace it with fresh borax.

Extracting Sulphur From Pyrite

At Queenstown, Tasmania, the Mt. Lyell company continues its work in this connection. The experiments have been hampered by slow delivery of materials. Coal-dust firing was applied to the rotary distillation furnace, but success was frustrated or delayed by the failure of the locally-obtainable refractory materials. Tests are now being made with gas-fired retort-furnaces.

THE COST OF MELTING the most refractory alloy—cupro-nickel—used at the Philadelphia Mint, in a Rennerfelt 1000-lb. electric furnace, is $9.45 per ton. This is 50% less than the cost with gas or crucible-furnace melting.

Mining Copper at Kennecott, Alaska

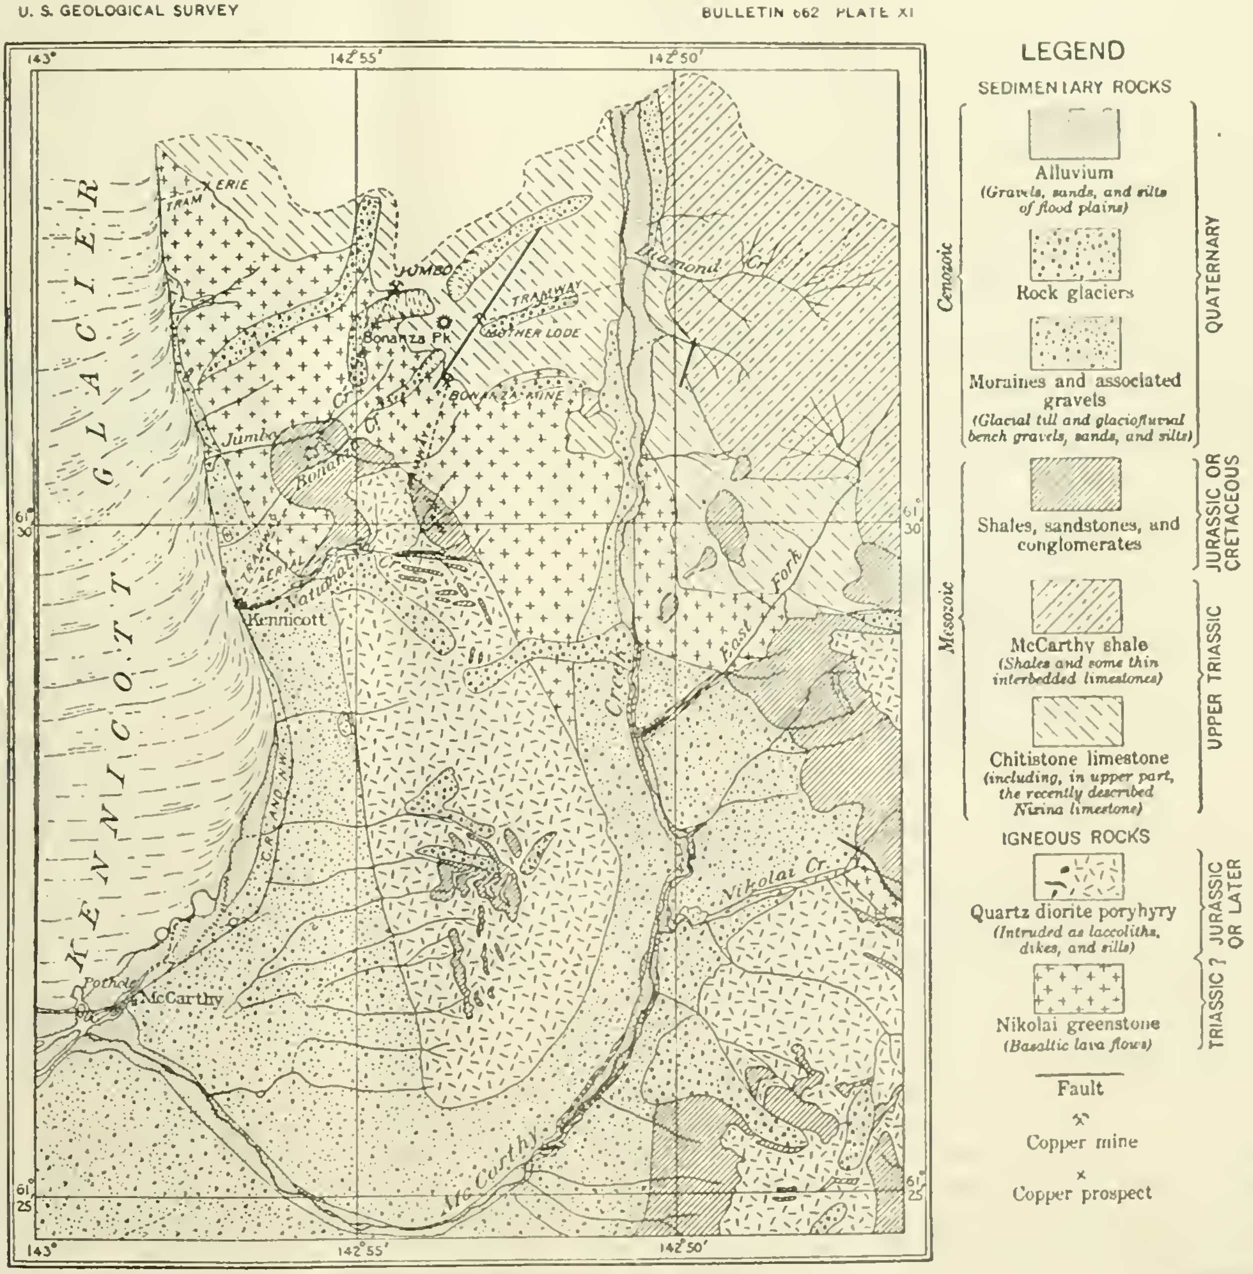
BY AN OCCASIONAL CORRESPONDENT

It is well known that the Kennecott Copper Corporation is operating successfully and is, in fact, obtaining brilliant results today in Alaska. This property has the advantage of handling large bodies of the highest known grades of copper ore, beginning at the outcrop. The actual tonnage handled has not been large, and the cost, even under war conditions, is not over 8 cents per pound.

The entire region in the neighborhood of this property has been thoroughly mapped and reported on by the U. S. Geological Survey.* All of this information is easily accessible. Anyone studying this mass of information will agree, after careful reflection, that this region offers many attractions to any development company that has no unreasonable hope of finding a bonanza without expending a proper amount of time, skill, and money, all of which are as much, but no more, required in this

---

*See 'Mining in the Lower Copper Basin', by F. H. Moffit. M. & S. P., June 8, 1918.



SKETCH MAP OF VICINITY OF McCARTHY AND KENNECOTT

Alaskan district as in any other part of the world.

Of course, all prospecting work will be necessarily done under extravagantly expensive conditions and without the usual facilities for obtaining supplies and labor. Costs will vary greatly, but after the work is centralized and systematized, they will be made reasonable. The large gold mines in the neighborhood of Juneau have not shown unreasonably high costs, but they have had their difficulties in obtaining sufficient labor and in recovering the gold in their low-grade ores.

If anyone asks the point-blank question, "What is Alaska like?", it is as difficult to give an enlightening reply as it is to describe Africa or Russia in a few words. There are as many different local conditions of climate and topography as there are in any other large country. It is hard to convince some people that it is at all practicable to work throughout the year. On the other hand, one very capable Arizonan operator believes that mining costs over an extended period should not be higher on the average in Alaska than in many other localities where copper mining is being conducted profitably.

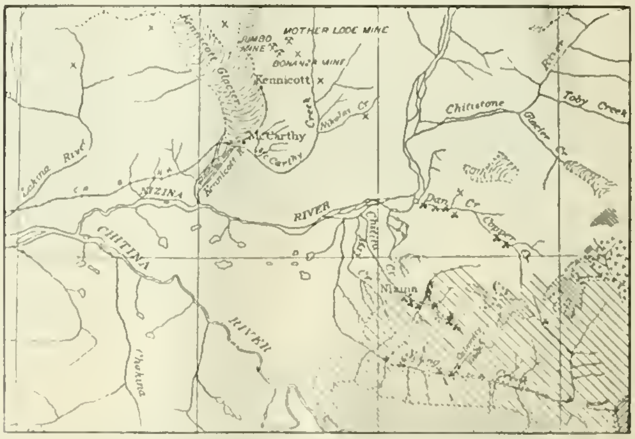
In the already prospected regions of Alaska there are no easily recognized surface indications of large bodies of primary ore, such as, for instance, the mountain of oxidized material at Ajo, Arizona, where with very little overburden, large acreages of oxidized material lay absolutely exposed to all prospectors. As one clever traveler in Alaska has said, many of the mountainous regions in Alaska literally "rain rocks". This part of the world, of course, is subject to great fluctuations of freezing and melting, so that the forces of erosion are naturally very active. This has its effect on the ore and is the cause of the great concentration in fissures and along contacts.

One of the accompanying photographs shows the Kennecott mill at the foot of the tramway from the mines and close to the Kennecott glacier. Right above the mill is an island or peak, which, as can be seen, is capped with limestone above the greenstone. The orebodies here lie, as in the Bonanza mine, along the contact, which dips sharply. The snow-capped peaks are Mount Blackburn and Mount Regal.

The following description of the Bonanza mine is borrowed from Mr. Moffit:

The Bonanza mine is in the mountains between the Kennecott glacier and McCarthy creek, at an elevation of 6000 ft. The first large orebodies found were in the magnesian limestone, so that at one time it was supposed that this rock had controlled the ore deposition and work was conducted accordingly. This supposition had to be given up, however, as the work proceeded, for ore was found in both the magnesian and the non-magnesian limestone. In the early days a great deal of talk was heard of the "favorable" lime, by which was meant the magnesian lime. Also, a great deal of talk is heard locally about bedding-planes. The bedding-planes, or flat faults, indicate the movement of one limestone bed on another, or movement along a plane parallel or approximately parallel to the planes or bedding. Bedding-plane faults occur in the lower part of the Chitistone limestone at many places and at least four are recognized in the Bonanza mine. The ore is dominantly chalcocite. The great orebodies belong primarily to the vertical fault system and have been found at the intersection of the vertical with the flat faults. They lie above the flat fault and terminate sharply against the underlying limestone. The exposures at the surface of the Bonanza mine show no more oxidized ore than those in some of the lower levels. Oxidized ore continues to the 700-ft. level. All small veins in stringers must be closely followed for many of them develop into valuable bodies of ore within short distances.

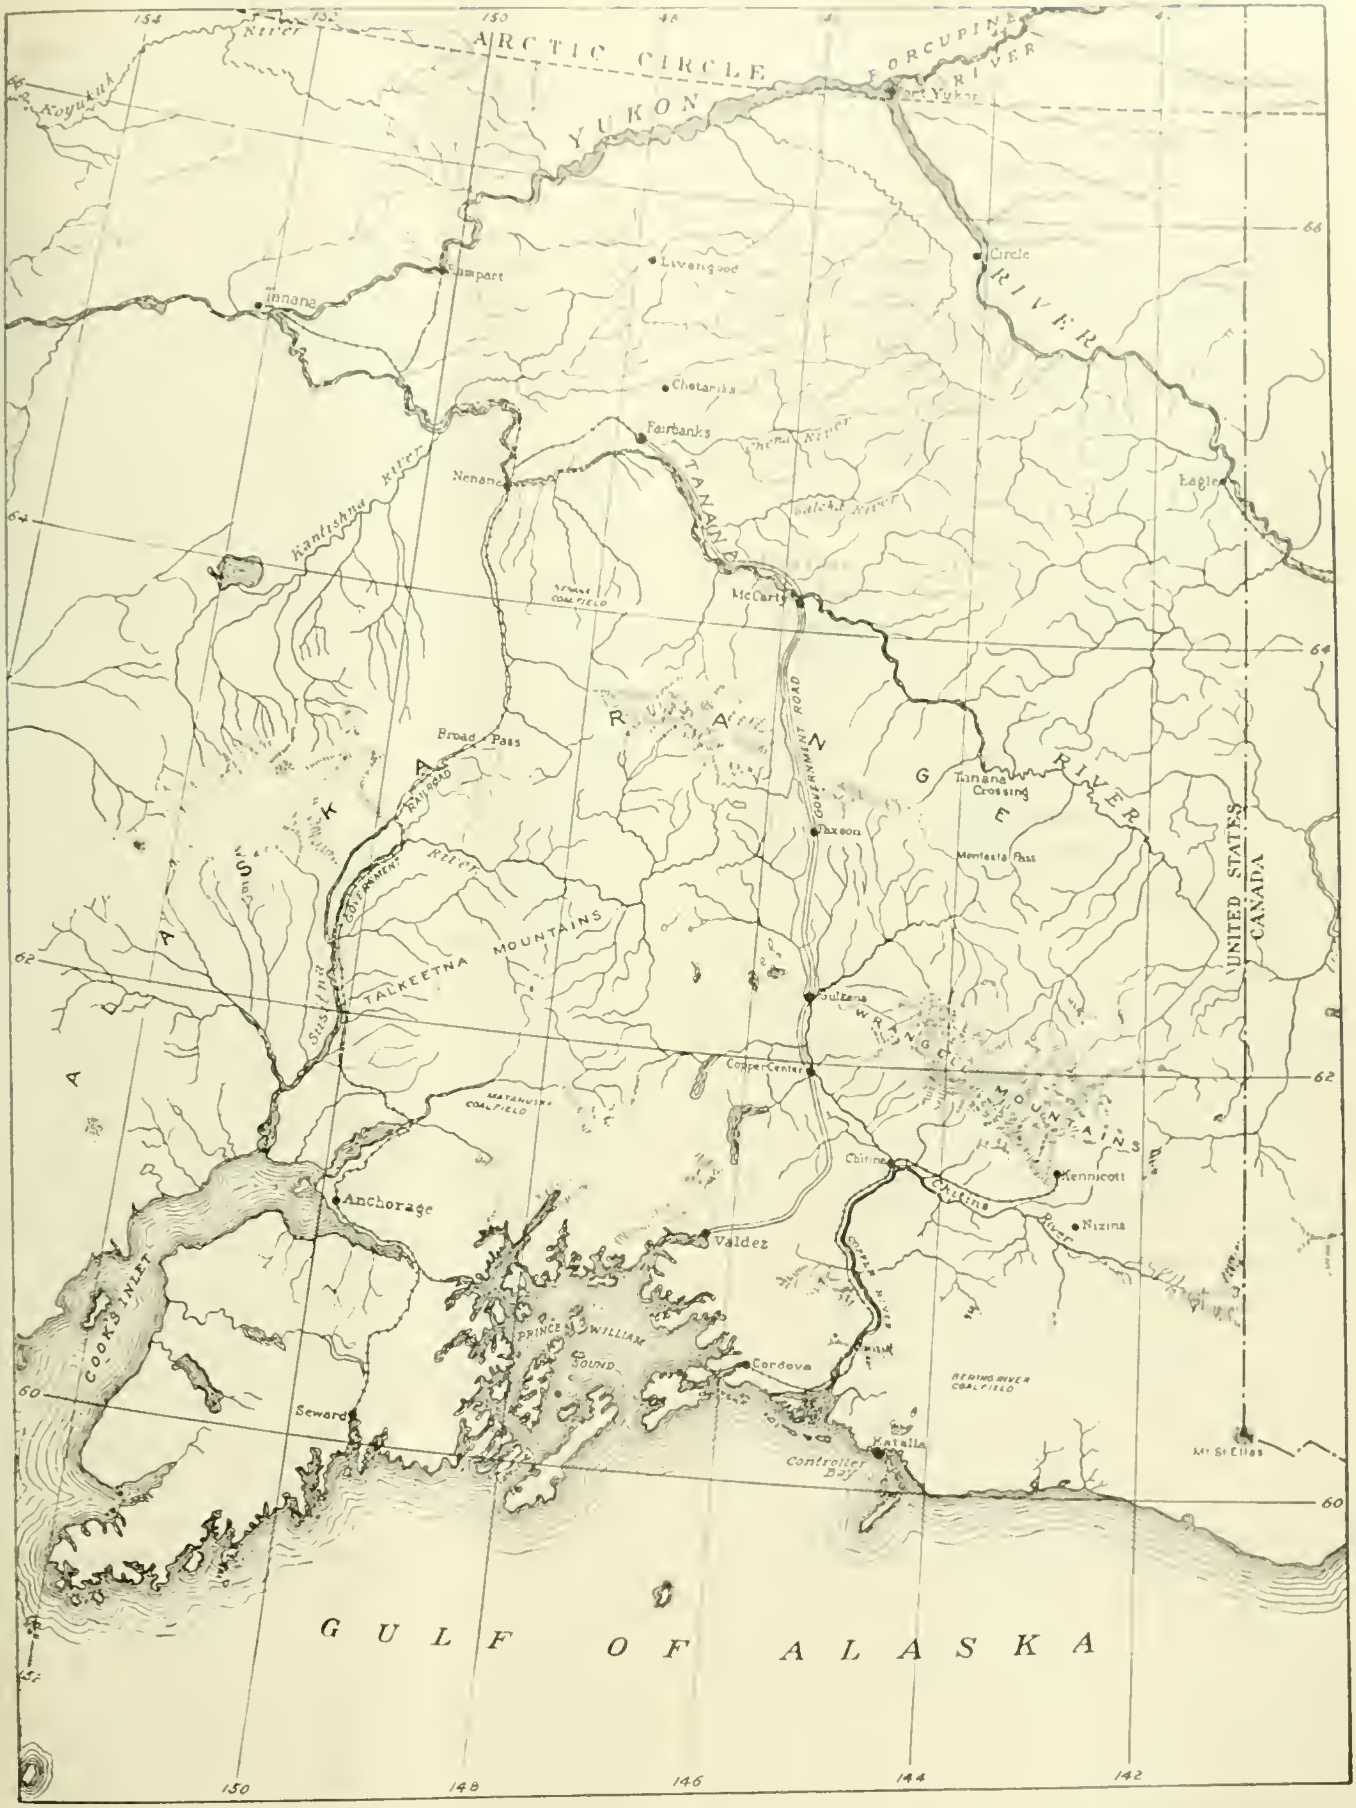
The copper deposits of the Jumbo mine resemble in most respects those of the Bonanza. The mine is in the Chitistone limestone, just above the contact with the underlying greenstone. The width of the ore-bearing ground worked is not less than 240 ft., yet the limits of the ore have not yet been reached. In form the orebodies are like those of the Bonanza, large tabular masses of chalcocite replacing limestone along the north-easterly faults. Ore was deposited in great quantities at the intersection of the vertical and bedding-plane faults, between the 400 and 600-ft. levels.



THE COPPER RIVER DISTRICT

The great orebody lay for the most part above the bedding-plane fault between it and the magnesian limestone. It extended from a point a short distance above the 600-ft. level to a point 30 ft. above the 400-ft. level. In projection on a horizontal plane it had a length of 400 ft. A horizontal section of the orebody at the 500-ft. level is shown. This great mass of ore was practically solid chalcocite, with which was mixed an almost insignificant quantity of included limestone. It has yielded 50,000 tons of copper ore, much of which ran 76%. This is the largest single body of this grade of copper ore ever mined.

The Erie mine is a little more than 3½ miles north of Kennecott and less than ½ mile from the glacier. The ore so far uncovered is much more oxidized than that of the Bonanza and Jumbo mines. At least one well-defined bedding-fault was encountered. This mine is equipped with an aerial tram 2700 ft. long, running between the lateral moraine of the Kennecott glacier and



PART OF SOUTH-EASTERN ALASKA, SHOWING THE GOVERNMENT RAILROAD AND SOME OF THE PRINCIPAL MINING CENTRES the upper adit. Most of the ore shipped from Kennecott is of high grade and requires no concentration. Part of it, however, is concentrated in the mill, the tailing from which is treated in the leaching-plant with ammonia, which dissolves the copper carbonate. By this process 65 to 72% of the copper content is recovered from the tailing. The loss is probably due to the fact that fine particles of chalcocite are not attacked by the ammonia. Much experimental work is being done to perfect the leaching-plant. The difficulties encountered have been mechanical rather than chemical.

The Mother Lode mine is situated north-east of the Bonanza mine. Since 1913 it has made shipments of ore each winter. This property has just been purchased by the Kennecott Copper Corporation. The ore is chiefly chalcocite; besides copper, it carries silver in the ratio of one ounce to each 4% of copper.

The deposits so far exposed are high above the limestone-greenstone contact, and in this respect differ from the orebodies of the Bonanza and Jumbo mines, which are near the contact. The mine is equipped with a tramway having a length of slightly more than 5000 feet.

Another photograph shows a prospecting tunnel on the Green group of claims driven on a fissure, in which stringers and veins of high-grade ore have been found. This working is connected by an aerial tram with the bed of McCarthy creek, 2700 ft. away, and the operations are prompted by the supposition that a similar geological formation should contain similar ore to that of the Kennecott group.

The showing of copper, in the form of patches and lenses of bornite in the limestone above and near its contact with the greenstone, is of a most inviting character, because among reasons the ore is so high-grade as to remind one more of precious-metal mining than the conventional disseminated copper deposit.

The purpose of this sketchy description of the district by one that knows it well is to suggest that it offers reasonable chances to the adventurous prospector, particularly to the young men returning from the War and previously possessed of some knowledge of mining.

NOTE. In 1917 the Kennecott mine produced 265,579 tons of ore assaying 13.78% copper. Of this 206,253 tons, averaging 8.92%, was treated in the mill for a yield of 29,559 tons of concentrate averaging 53.52% copper. The recovery was 85.98%. At the leaching plant a total of 98,075 tons of tailing averaging 0.9% copper, was treated, for a yield of 1,244,200 pounds of copper. The aggregate shipments to the smelter came to 89,799 tons averaging 38.57% per ton. The ore contains silver and gold. During 1917 a total of 933,573 ounces of silver was recovered, with 78,211,429 lb. copper. It is rumored that ore rich in gold has been struck recently in the lower workings. The Kennecott Corporation has absorbed the Braden Copper Mines and other mining property, so that the exact performance of the Kennecott mine is now obscured. Production averages 6,000,000 lb. of copper per month.

The Magnesite Industry

Magnesite production of California and Washington during the first nine months of 1918 was as under, in tons, according to the U. S. Geological Survey:

State	First quarter	Second quarter	Third quarter	Total
California	25,000	28,000	16,500	69,500
Washington	22,000	23,500	45,000	90,500
	47,000	51,500	61,500	160,000

The combined output of these two States in the fourth quarter will be about 65,000 tons, making the total for the year 225,000 tons. This is a large decrease—30%—from the output of 1917, when California produced 211,000 tons, and Washington, 105,000 tons.

Two Californian mines—the White Rock mine in Napa county, and that of the Refractory Magnesite Co. in Sonoma county—yield a product that contains more iron than other Californian magnesite. It is dead-burned and sold as grain magnesite and brick for use as refractory material by steel manufacturers in the Western States. These two mines, which have been steadily producing this material and will probably continue to do so, are now making a large part of the total output of the State. All the small mines in the State are closed, and the few larger mines that remain in operation are producing at a rate representing only 25 to 50% of their capacity.

In the State of Washington only two companies are operating. They have spent large sums during the last two years in developing quarries and building plants, and are now able to produce raw and calcined magnesite in large quantities. Each company can turn out more than 10,000 tons of raw magnesite per month. The Northwest Magnesite Co. is making several thousand tons of ferro-magnesite per month in a large plant which it has erected at Chewelah, 60 miles north of Spokane. The plant includes five rotary-kilns, each 120 ft. long, which are fired with pulverized coal. The machinery is driven by electricity furnished by the Stevens County Power & Light Co. Two 300-hp. gas engines, together generating 400 hp., have been installed at the plant for additional power. The American Mineral Production Co. ships several thousand tons of raw magnesite per month from Valley to Irvin, 8 miles east of Spokane, where it is converted into ferro-magnesite in the plant of the International Portland Cement Co. It is reported that the output of ferro-magnesite from this plant in October, 1918, was about 150 tons daily.

NICHROME MUFFLES are now used in the cupellation furnaces of the New York Assay Office. In evenness of temperature and freedom from cracks the new material is much superior to the best of clay muffles. It is anticipated that the life of a nichrome muffle will be not less than a year. Nichrome plates, holding 16 cupels, are used, permitting the whole to be inserted and removed from the furnace at one time, according to the recently-published annual report of the Director of the Mint. Nichrome is mainly an alloy of nickel and chromium. Wire made of this is worth about $35 per ounce.

Broad Pass, Alaska

By F. Le ROI THURMOND

Broad Pass is a wide glaciated valley between the head of the Chulitna river and a tributary of the Nenana, named Jack river. It is commonly regarded as one of the passes through the Alaska range, but in reality it is part of an east-west valley connecting the heads of the Susitna and Chulitna rivers.

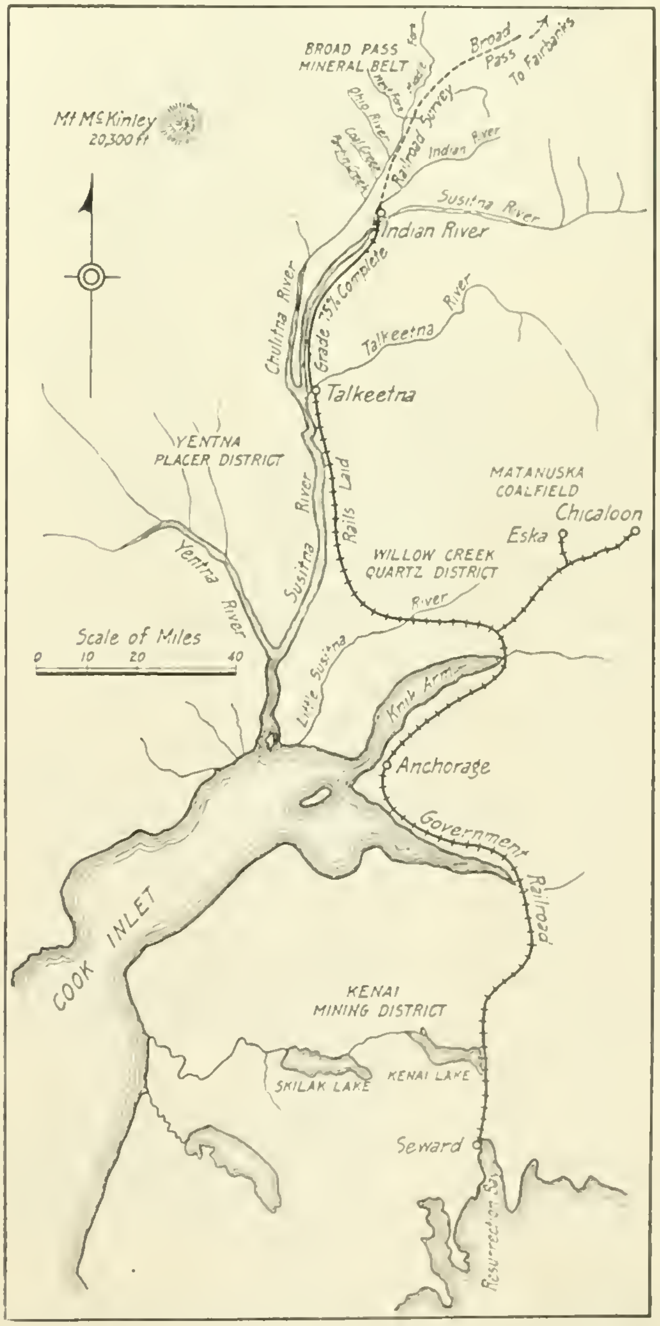
The Broad Pass region, as the term is here used, includes the headwater tributaries of the Chulitna and Nenana rivers and the heads of some streams flowing into the Susitna.*

The vicinity of Broad Pass was first visited by Government exploring parties in 1898, when G. H. Eldridge and Robert Muldrow of the U. S. Geological Survey, accompanied by five others, ascended the Susitna river as far as Indian river, whence they proceeded on foot, packing their suppiles on their backs. In 1902, Alfred Brooks led an exploring party across the Alaska range, starting from Tyonek on Cook's Inlet, crossing the range at Rainy pass, then along the flanks of the range to the Nenana river, and thence to the Tanana and the Yukon. This party, while visiting only the borders of the Broad Pass region, collected a great deal of valuable information, which has been published by the Survey.†

In 1902-1903 a reconnaisance survey was made through the Pass by the promoters of the Alaska Northern Railroad, which was designed to extend from Seward on Resurrection bay to a point on the Tanana river. It was at this time that mineral deposits were discovered in the Broad Pass region by prospectors attracted thither by the prospect of an early completion of the railroad. When the railroad failed, however, the claims were abandoned. In 1910, John Coffee, Frank Wells, and Lon Wells re-discovered promising prospects on the west fork of the Chulitna river about 12 miles from its junction with the middle fork. Other prospects were found on Costello and Colorado creeks, tributary to the west fork.

In 1914 and 1915, when it became generally known that Broad Pass had been selected as the route of the Government railroad, there was a considerable rush of prospectors to the region, attracted by reports of large orebodies and rich assays. Many of the assays reported were fictitious, being the work of an unscrupulous assayer who sought to profit from the excitement caused by reporting high values. While there was some disappointment resulting from the failure of the facts to measure up to expectations, mining prospects of merit were discovered. More recent exploration has further enlarged the known mineralized area, which extends from the middle fork near Caribou pass, in a south-westerly direction to the Chulitna glacier.

The rocks of the region are mainly sedimentary, consisting of slate and graywacke, limestone, chert, and cherty conglomerate, and andesitic tuffs, belonging for the most part to pre-Devonian periods. They have been



MAP OF PART OF ALASKA, SHOWING BROAD PASS AND THE GOVERNMENT RAILROAD tilted, in the uplift of the Alaska range, and intruded with granitic and rhyolitic dikes and stocks. Ultra-acid magmatic phases are present as 'alaskite'. Metamorphism is local, being confined to the borders of intrusions. Mineralization followed the intrusions, in places being confined to fissures, but in others, impregnating whole masses of intrusive rock, as at the Golden Zone group of claims on the west fork, owned by John Coffee and the Wells brothers. Here an acidic dike invading cherty conglomerate has been mineralized with pyrite, chalcopyrite, arseno-pyrite, gold, and silver. High average values have been reported from trench-samples over widths exceeding a hundred feet. This property was under bond to the Guggenheims in 1915, but they released it without doing sufficient work to determine its real value.

---

*'The Broad Pass Region, Alaska'. Fred H. Moffit, U. S. G. S., Washington, 1915.

†Professional Paper No. 70, 'Mt. McKinley Region, Alaska'. Alfred H. Brooks, Washington, 1911.

About a mile from this property is the Riverside group, located by the same parties and held by a Spokane corporation, which proposes to exploit the ground when transportation conditions shall have made such a course advisable. Gold and silver are contained in an acidic dike invading chert and limestone. Arsenopyrite and chalcopyrite are the common sulphide minerals. A cross-cut tunnel, 80 ft. long, is not through the mineralized zone.

On Long creek, about a mile from the Golden Zone, is a promising copper prospect owned by the Bouker brothers. The ore is chalcopyrite and high-grade, and is said to occur in a large body.

Southward in the zone on the Ohio river is a group of claims owned by Dr. McCallie, Howard Wilmoth, and associates, of Anchorage. This property has recently been bonded. It was examined by me during the summer of 1918. The formation is limestone and tuff invaded by dikes of granite and alaskite. The ore contains galena, pyrite, chalcopyrite, and arsenopyrite, with silver and gold in fissure-veins, of which there are a number in parallel.

A typical analysis from an outcrop eight feet wide shows: silver 25 oz. per ton, gold 0.04 oz., copper 1.5%, lead 6.8%, iron 22%, silica 30%, and sulphur 12.9%. A sample from another vein shows more chalcopyrite and assayed as follows: silver 15 oz. per ton, gold 0.2 oz., copper 3%, iron 12.5%, silica 55%, and sulphur 6.8%.

About ten miles from the Ohio River location, on Partin creek, are a number of large copper-bearing veins in limestone. High assays in gold and silver have been obtained by me, and from the meager data at hand the prospects appear to be promising.

At a locality near the head of Coal creek there occurs a body of zinc-blende associated with pyrrhotite in a granite-slate contact. The orebody is exposed for a width of 20 ft. where the moss has been stripped off. Copper float found in large masses near-by indicates more extensive and varied mineralization.

The genesis of the ore deposits is undoubtedly connected with the invasions of the sedimentary rocks by the granite and other acid intrusives. Discussing the mineral resources in Professional Paper No. 70, Mr. Brooks says:

"Large masses of intrusive granites and grano-diorites cut the Tordrillo formation and older sedimentary rocks of the province. These intrusive rocks are believed to be for the most part of Mesozoic age and were probably injected chiefly during latter Jurassic time. Lithologically and in time of intrusion, they correspond to the great batholiths of granite which form the Coast range of south-eastern Alaska and British Columbia. It has been shown by Spencer, the Wrights, and others, that in south-eastern Alaska there is a close association and a genetic relation of the orebodies and the granitic intrusive rocks. As the granites of the Alaskan range are similar in character to those of the Coast range, it is plausible to consider that they may also be agencies of mineralization."

From a consideration of data obtained in the field, I am convinced of the truth of the above-quoted conclusion. In every instance where orebodies were seen, a granite or other acidic igneous rock was found near-by, in one instance giving indisputable evidence of the genetic relationship of dike to vein.

The fact that in south-eastern Alaska, where similar conditions exist, there are known to occur many large and valuable orebodies, together with the evidence of extensive mineralization in the area under discussion, and the prospect of an early completion of the Government railroad, places this region favorable for exploration.

Power-Plant on a Philippine Dredge

A radical innovation is the motive power designed for the Mambuloa dredge in Ambos Camarines in the Philippines, according to Charles Janin in 'Gold Dredging'. A steam turbo-generator was placed on the dredge to provide the electric current, being the first instance of such a plant being used for gold dredging. The dredge plant consists of a 300-hp. wood-burning boiler with condenser and a 625-kva. (500 kw. at 80% power-factor) turbo-generator running at 3600 r.p.m., 440-volt, alternating-current, three-phase, 60-cycle, with direct-connected exciter. The main drive motor is 150 hp. with reversible speed-controller, which will reduce full speed one-third. The other motors are as follows: main winch, 20 hp.; high-pressure pump, 120; low-pressure pump, 75; screen drive, 40; and stacker, 40 hp. In addition to the main power-plant there is an auxiliary steam engine of 20 hp. which can operate the winch and move the dredge in case of accident to the turbo-generator, during a storm or other emergency. This engine is used for lighting the dredge when the main plant is shut-down, and can also be used to take the place of the exciter in the generator should that get out of order. The water for the boilers comes through a special pipe line from a fresh-water spring in the hills. This plan was adopted to obviate the possibility of damage from salt water in the river, which caused serious boiler trouble on one of the dredges in the Paracale district.

A Letter From Garcia, on Returning From the War

From Placedio Garcia on arrival at Ellis Island, N. Y., to his cousin at Santa Rita, N. M. From the 'Chino News.'

Dear Cousin:

Much would be your cousin's pleasure if this letter would find you in good health, in companionship of my dear aunt and the rest of the family. The present leaves your cousin in good health, living a good and gay life. Thanks to God.

Cousin, after much suffering, I have come back to the U. S. A. with good health, but a cripple, and I think that I will be such for life. Four of the bones are missing from my right foot, which is enough so that I will not be able to walk again as I used to. I have completed two months since I left my crutches, and yet I cannot straighten my foot. But I don't care; the pleasure that was left me is that I was not the victim of my enemies. Thanks to God for everything. He is the one who took care of me in all dangers and in all my sufferings and pain. Last of all, He brought me back to my idolized country, for which I would die, and for which I fought, and while doing so was left thrown, at the blackest and most dangerous place of the battle.

The hours in which without water and without food for two days, I fought desperately, so desperately that I sought death and could not find it. It was a dark and sad night where only pain and things that looked like hills or piles could be seen at a distance. These were the bodies of those who only a day and a half before had lost their lives and sent their last sigh and breathed their last breath for their dear mothers—their unfortunate mothers who had not even the pleasure of seeing their beloved sons for the last time. It is cruel, my dear cousin. At first it strikes with terror those who decide whether to win or die. The first few days you cannot get accustomed to it, but after the third or fourth day you have made up your mind to win or die, and you don't even give a snap for death or thoughts of it. I thought that never in my life I would or could support a similar blow, but I was able to support it. Not like the bravest of my company, but like a good soldier and not a coward.

It was about eleven at night when we had to make the first attack. The command was given and we marched to the trenches. We had not gone half a mile when a bullet passed over my head and went through the heart of an unfortunate one who was coming behind me. He lifted his arms in the air, gave a heavy sigh, and died. This was the first death that I saw. We covered his face and went forward, but we had not taken twenty steps when we were overtaken by the grapeshot. We were suddenly flung to a rivulet and could do no more than fall into any hole that we might be able to find.

"From where are they firing?" This was a question asked me by an American who had his head in a hole and the rest of his body out where ten or more bullets could have passed through his body. I said, "Take your head out of the hole; if death pursues us in this battle it will continue no matter where you hide; this is no time to hide, the enemy is about to come upon us; let us take a good position." He turned around and with trembling hands filled his rifle, which he had not filled yet, and placed himself by my side to observe and wait for the command from our captain to advance. The command came and forward we went again. No sooner had we started than the grapeshot from a distant battery overtook us again with all the force possible. All of a sudden we were lying on the ground on our stomachs with our eyes fixed to the place where we thought the grapeshot came from, but we could see nothing but darkness. That is how we passed the night. It was the night of the 27th of July.

On the 28th, at dawn, we were overtaken by the aeroplanes, which threw bombs very fast, but they did nothing to us. I do not deny, cousin, I was perishing of hunger and thirst. We went forward until we came to a forest very near the enemy, and had just gotten into position when the German artillery at one side, the grapeshot at another, and the areoplanes above, overtook us. Our company was almost destroyed, only a few were left. We ran as the command was given, taking holes for refuge. I ran and looked hard for a hole, and I said within me "Good-bye world." It had not been three minutes after I left the hole where I was protecting myself when a high explosive fell and tore it to pieces, making of said place a hole about 12 ft. long and 12 ft. wide, and at the time that it exploded the sand that was blown by the act fell over me, covering my entire body, only leaving my head a little uncovered. I began to move it a little, until desperate as I was from lack of breath I was able to uncover my eyes and nostrils. I began to breathe little by little until, at last, with heavy breaths, I was able to blow the sand and uncover my mouth. Then it was different. This is how I passed three hours of that night until one of my companions discovered me and helped me out. The enemy was retiring. We ran ahead to catch our company and joined them, and I began to work hard with my little rifle. I soon found a hole for myself big enough for two persons. I sat down and started to clean my rifle, when all of a sudden, just as a cat jumps upon a mouse, an American companion fell into my hole. We soon began to make a noise. He had a slice of bread and some water, so he gave me half of what he had and we started to converse and to laugh and chatter. He was the first American that I had seen laughing since I had been in battle. He showed me the picture of his mother, and also the picture of his sweetheart, and told me that if he died first for me to send his things to his folks and that if I died first he would do likewise. That is what he was saying when he thought he would like to make the hole larger and began to work with his little shovel, but on one of the times that he straightened up to rest he fell to the bottom of the hole with a horrible groan. This struck me with terror. I placed my arms around him and talked to him, asking him questions, but he would not answer. What he said was only this: "Take care of yourself, my dear friend." and he breathed his last and was gone. I said to myself "Goodnight", may God take him to Glory, and for the first time while in battle tears were running from my eyes, to see that as soon as I would get a good companion to laugh and chatter with he was taken from me.

I took my rifle and examined it and found it perfect. I saw ahead of me through a little hole, and through the weeds and dust. Bullets passed fast over my head to stop on the body of some one else, and God only knows who were the unfortunates. I soon discovered the head of a German who was working hard with his elbows to take possession of the hole I had. This unfortunate German thought that he had killed the only occupant of the hole, but seeing the muzzle of my rifle very near his head he threw down his rifle and lifting his hands cried with all his might "Kamerad!" I did not give him time to say more, but answered him with a bullet that passed through his head. At that time I heard the command to advance. I took my rifle, ran ahead, and found another very good hole. Just behind me an Indian came in, and he was as unfortunate as my unlucky American companion, but nothing happened to me, thanks to God. No sooner had he come in when a German killed him. This German also thought that he had killed the proprietor of the hole. He worked hard with his elbows until he was about five feet from my hole, when I saw him. He gave me time only to take my rifle and receive him with my bayonet. Because my magazine was empty I had to use my bayonet, which I ran into his breast making him fall dead at my feet. The command came again, and we advanced a little more. A high explosive fell near me and sent a piece of iron into the lower part of my foot, throwing me about five feet from the ground at the same time. That was enough to put me in bed for quite a long time. I was taken to the base hospital, No. 3, and here you have me now, full of life and happiness, hoping to see you soon.

Give my best regards to my auntie and to all my cousins, and you receive your cousin's sincere love. I remain.

Placedio Garcia.

Photography eventually is expected to reduce the cost of topographic surveys and lessen the time required for them. Alaska contains a greater proportion of mountains favorable for photo-topographic surveying than the United States proper. The panoramic camera is the instrument used. This camera has been highly developed for topographic mapping in Austria, France, and Germany; while large areas have been so mapped in Canada.

Minerals Separation and the Federal Trade Commission

The aggregate tonnage of ore milled and in part treated under upward of 100 licenses issued in the United States by the Minerals Separation North American Corporation runs in excess of 28,000,000 tons annually. That its licenses have tended to encourage the mining industry rather than stifle it through recovering from ores formerly dumped important values; and that the company uses no coercion in the use of its inventions are statements made by the Minerals Separation Co. in answering the recent charges of the Federal Trade Commission. General denials to the Commission's allegation of monopoly and unfair discrimination are made.

In citing the one-time business relations of the Minerals Separation companies with Beer, Sondheimer & Co., the former state that the firm "acted as agents for Minerals Separation American Syndicate, Ltd., between 1910 and 1913 and . . . for Minerals Separation American Syndicate (1913) Ltd. from September 1913 to on or about August 3, 1914, when at the outbreak of the European war, the agreement . . . was cancelled and the agency terminated." The citation further disclaims knowledge as to whether Beer, Sondheimer & Co., Inc., a New York corporation, acts as agent or representative of the German firm of similar name.

Minerals Separation North American Corporation is now and for more than a year has been, the answer cites, engaged in issuing licenses for the treatment of certain ores and dumps in accordance "with inventions, patents, processes, and apparatus described and claimed in letters patent . . ." It denies, however, doing an interstate commerce or trade. It also denies competition, but "alleges on the contrary that said Minerals Separation North American Corporation is the sole beneficial owner of certain letters patent of the United States of America and of certain processes and inventions covered by such patents relating to the separation and concentration of ores and that its business is limited to the granting and administration of licenses . . . and to lawful enforcement of . . . rights . . . and that no one is lawfully entitled to engage in said business in competition with this respondent." Minerals Separation denies entering into or enforcing or attempting to enforce agreements for purpose of stifling and suppressing competition.

Minerals Separation alleges that "this commission is without any jurisdiction to pass upon the reasonableness of any royalty charged . . ." On two occasions were special terms granted, the respondent admits, one being the license granted to the Anaconda-Inspiration group and the other to the Colusa Parrot Mining Co. The former assured Minerals Separation a large sum of money regardless of what the Supreme Court decision in the Hyde case might be; the other because of "the quality of its dumps, the low recovery and the narrow margin of profit of which to said company made it equitable at the time . . ."

REVIEW OF MINING

LEWISTOWN, MONTANA

Mining in Central Montana During 1918.

Mining in central Montana has not been as active in 1918 as usual. There was a shortage of labor resulting from the draft, high wages in other industries, and volunteers for the engineering corps. Litigation and disagreements between stockholders caused some mines and prospects to remain idle. The owners of other properties, especially those producing gold, await the return of normal conditions before commencing development work or re-opening their mines. Influenza seriously affected many mines during the last three months.

In the Little Rocky Mountains in Phillips county the Ruby Gulch company was the only operator. Its properties are at Whitcomb, a few miles from Zortman. About 200 men are employed and the output is $30,000 per month. The ore contains only $1 to $3 worth of gold per ton, but occurs in a wide lode of altered porphyry, and such cheap methods of mining are possible as to permit the company to make a good profit. The August mine at Landusky was closed in 1918, but some encouraging development work was done on prospects near-by. The mines near Zortman are about 50 miles from Dodson and 60 miles from Malta, the nearest railroad points.

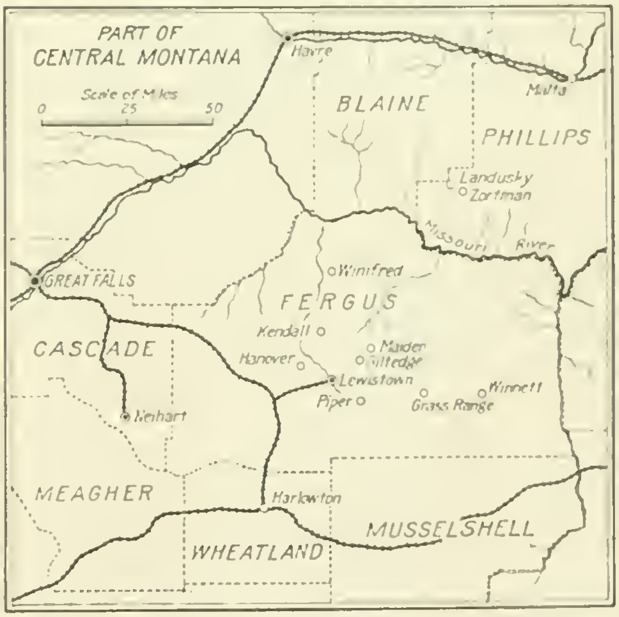
The Barnes-King Development Co. operated its North Moccasin mine at Kendall, in Fergus county, regularly and its production will be nearly $200,000 in gold for the year. The production came from the old orebodies, from which $8 to $10 gold per ton was recovered by the cyanide process. Unless new ore-shoots are discovered the outlook for a long life for this property is not encouraging. The Barnes-King has produced about $4,000,000 from its Kendall properties. The gold occurs as a replacement of limestone and was probably derived from laccolithic intrusions, although no igneous rock is found in the mine itself. The orebody is in part composed of altered porphyry. The Kendall mine has been operated by lessees the last three years, and an output of several thousand dollars per month has been maintained. The ore comes entirely from an open-cut, which permits of cheap mining. The mine seems to be worked out in depth. Very little prospecting has been done in the North Moccasins during 1918.

Mining in the Judith mountains has been at a low ebb. During 1916 and 1917 the Maginness, Spotted Horse, and Cumberland mines at Maiden were all operated under lease and produced a large amount of gold, but this year the Spotted Horse was closed because of difficulty in renewing the lease, the lessees of the Cumberland joined the army, and the Maginness operated only a short time. It is expected that the return of normal conditions will cause the mines at Maiden to be operated as usual. Bardwell and Pittman of Lewistown are opening a copper prospect in Alpine gulch. Several men were prospecting near Giltedge, but no good orebodies were discovered. Development work was done on the Sutter copper claims on Armell's creek, but litigation prevented the sale of ore. S. P. Williams of Lewistown reports some good assays from his claims. E. B. Coolidge built a small cyanide mill at Giltedge to re-treat the tailing from an old mill.

Several mines were active at Neihart in the Little Belt mountains. A new mill was built and considerable ore was developed. The valuable metals are zinc and silver. The ore goes to Great Falls and East Helena for treatment. Butte and Eastern capital have invested in the Neihart mines. Very little production came from the lead-silver and copper mines of the northern and eastern parts of the Little Belts. The sapphire mines at Yogo have been closed most of the time since the War began, but it is planned to resume operations in 1919.

Prospecting was done in the Castle mountains in Meagher county for copper, lead, silver, and manganese, but the production will be small.

Oil and gas prospecting, the leasing of structurally favorable ground, and the formation of new companies characterized the oil industry in central Montana in 1918, but no important discoveries have been made. Drilling was done on an immense dome near Bowdoin in northern Montana. In Fergus county two companies are drilling in the Winifred field, a well was drilled near Piper, another north of Grass Range, and a fifth south of Winnett in Devil's Basin. Drilling was also in progress in Woman's Pocket in the Musselshell valley, and in Elk's Basin, west of Harlowton. Several hundred thousand acres of domes, anticlines, terraces, and faults have been leased in central Montana and several dozen companies are organized for business. Gas was found in commercial volume at Havre a few years ago, and has been found in small amounts elsewhere. No producing oil-well has yet been brought in. Prospecting and drilling will continue actively in 1919, although the poor crops in some sections make it difficult to raise funds for drilling.



The Barnes-King properties at Kendall are among the chief gold producers of Montana. The Southern Cross mine at Georgetown, from which iron ore is mined, was the third largest producer during 1918.

CRIPPLE CREEK, COLORADO

Drainage-Tunnel Developments.—Production in 1918.

The Portland cross-cut from the Roosevelt drainage-tunnel was on December 14, seventy feet distant from its objective point under No. 2 shaft, and the shaft had been sunk to a depth of 2113 ft., or 20 ft. above the tunnel-level. The work is estimated to be completed and connection made by the end of the year.—The Cresson company's main shaft has been connected with the tunnel cross-cut at a depth of 1950 ft., and the station and shaft have been timbered. Production from the two orebodies under development at the tunnel-level, however, will be carried on through the Elkton shaft.

The Roosevelt tunnel may now be considered completed, as work has ceased with the heading in the centre of the Hawkeye claim of the Portland company. The total length of the tunnel from portal to breast is 24,355 ft., or 4.6 miles, and it is one of the longest in the United States. The Roosevelt tunnel has taken 11 years to drive and its cost has been $812,000. This sum includes sinking of an intermediate shaft 700 ft., and a raise of 160 ft. to connect with the Elkton main shaft, through which the tunnel is now operated. The average cost has been $33.30 per foot. The saving in pumping costs alone is conservatively estimated at $3,000,000. In 1918 two long drifts were driven from the tunnel, one of 1720 ft. to connect with the Cresson shaft; the other 2000 ft. connecting with the Portland No. 2 shaft, at a depth of 2133 ft. The flow from the tunnel has varied from 17,000 gal. per min. in 1906 to the present flow of 2500 gal. The district has been effectively drained, as not a mine is pumping.

The Lincoln Mines & Reduction Co. is making progress with construction of the concentrating plant on its Ironclad Hill holdings. The concrete retaining walls and foundations for machinery have been laid, and 200,000 ft. of lumber has been contracted for. The plant is to make use of the Gasche air-concentrating process. It should be ready for a trial within 90 days.

Christmas dividends will be passed this year by the regular dividend-paying companies, but while shareholders are overlooked employees will be remembered. The Cresson and Golden Cycle companies paid their regular monthly dividends on December 10, and on Christmas Day their employees were given bonds and thrift stamps. Those in service the longest will receive bonds and larger gifts. The Portland company, paying quarterly dividends, will give every miner in its service prior to October 1, a $5 bill, and those since that date $2.50. Other companies and lessees will also remember their employees in substantial form.

A reduction of from 1 to 2 cents in powder, according to grade, has been put in effect by dealers in explosives.

Frank Kurie, former superintendent for the Portland company, who has been absent for a long period in Government service, will resume operations after January 1. He has secured a lease option on blocks 215-216 of the Stratton estate on Bull hill. The ground covers the Shurtloff holding of the estate, and Kurie some years ago mined a good grade of ore from the Hawk shaft on the property. The blocks are directly over the Basket and Luce discovery at the 1500-ft. level of the American Eagle shaft, and Kurie is confident that with sinking he will open the vein nearer the surface.

The Golden Cycle company's protest against the increase in rates for electric light and power, put in effect by the Colorado Springs Light & Power Co., came up for hearing before the State Utilities Commission at Denver during the past week and has been taken under advisement.

The output of Cripple Creek during 1918 is over $2,000,000 below the 1917 total. The tonnage reported as treated by mills and smelters is 1,087,029, valued at $10,509,705 gross. The average value, due to large tonnage of dump ore treated, is low, $9.47 per ton.

Five companies paid dividends totaling $2,380,000—Cresson, $1,464,000; Golden Cycle, $540,000; Portland, $300,000; Vindicator, $60,000; and Granite, $16,500. The distribution of close corporations and the division of profits by lessees and leasing companies is conservatively estimated to add $250,000.

Properties of 65 companies, including dumps, were in operation during 1918. Many discoveries were made at and near the surface and at a great depths. The more important were those made in the Cresson, Rose Nicol, and Portland mines, at depths of 1950 ft. in the Cresson to 2133 ft. in the Portland. These discoveries were made on the Roosevelt tunnel-level.

ELY, NEVADA

Silver, Tungsten, Manganese, and Copper Notes.

There is considerable activity at the old camp of Cherry Creek, 50 miles north of Ely. J. W. Walker took hold of the Mary Ann property, a mile west of town, last February, with practically no capital. His first three cars of ore assayed 25 oz. of silver per ton, putting him on his feet; he has been shipping continuously since. Recently he sold to prominent New York people, who are providing a capital of $100,000 for development. They have purchased a small ranch in the canyon, which has some water, for milling purposes. The Black Metals mine, 5 miles north of Cherry Creek, from which Fletcher and son-in-law have shipped 13 cars during the past six months, has been taken over by Walker, and will be developed; also the Mother Lode, a large contact vein, adjoining. Walker also has an option on the old Exchequer silver mine adjoining the Star mine, which is being examined for New York interests. They will also examine the old Egan mines in Egan canyon, 5 miles south of Cherry Creek.

The Delker copper mines, 25 miles west of Currie and 70 miles north of Ely, is also under option and examination. Two years ago Ames shipped a dozen or more carloads of 7% copper ore from this property. The vein faulted and was lost.

Salt Lake City people are developing the Lucky Deposit copper mine, at Aurum, 30 miles east of Cherry Creek on the Spring Valley side of the range. Many shipments were made from this until climatic conditions interfered. East of this 25 miles, O. E. Roodhouse, who was superintendent for the U. S. Tungsten Co., 12 miles south of Osceola, two years ago, and shipped a quantity of concentrate, is developing the Shepherd tungsten mine.

W. Stewart and Millick brothers' tungsten property, 25 miles south of Osceola, which has been under development by Los Angeles people during the past year, recently have completed a 100-ton mill. The price of tungsten is the question that is worrying the management.

A. B. Witcher is finishing his contract on his manganese shipments from the property 9 miles south of Ely. This has been a profitable mine, having shipped 2500 tons of 42% ore. Holmquist & Bowen, adjoining, shut-down some time ago. Both of these mines have large bodies of good-grade ore. Witcher has over 1000 tons blocked out. The future is problematical.

It is reported by officials of the Consolidated Coppermines Co. that they will close their Pilot Knob mill within the next 60 days, operations not being profitable. The grade of ore from the Morris shaft is reported at present to be less than 1% copper. The Alpha workings, at the Giroux shaft, on the 1200-ft. level are in good ore, carload shipments carrying 7 to 11% copper. There are large bodies of 5% ore. Development is proceeding on the 1300-ft. level, which shows high-grade ore.

A review of mining in the Western States, prepared by the U. S. Geological Survey, appears on the last three pages of this issue.

ARIZONA

Bisbee.—Shattuck-Arizona pays 50c. per share, equal to $175,000, on January 20.

Humboldt.—Consolidated Arizona Smelting Co. reports as follows for nine months of 1918, and corresponding data for the same period of 1917 and 1916:

	1918	1917	1916
Ore mined, tons	137,319	107,077	81,129
Concentrator treated ore and tailing, tons	82,270	76,713	60,051
Smelter treated:			
Company ore and concentrate, tons	79,412	59,900	38,456
Custom ore and concentrate, tons	41,262	42,537	33,370
Total smelted, tons	120,674	102,437	71,826
Copper produced, pounds	15,500,000	13,930,000	7,101,000
Silver produced, ounces	349,237	175,530	97,116
Gold produced, ounces	11,067	6,815	1,355
Profit from operations	$705,687	$685,776	$566,724
Average price of copper, cents	24.002	28.474	26.406

The company produced 1,030,000 lb. of copper during November. There has been a decrease since March, when the output was 2,270,000 pounds.

Kingman.—Discovery of wulfenite has been made by R. O. Pierson, 20 miles east of Kingman. The ore carries considerable silver.

The Yucca Tungsten Co. has recently put in two K & K flotation machines, enabling the company to clean-up a large tonnage of copper-tungsten ore on dumps. It is said that a carload each of copper and tungsten concentrates can be shipped monthly.

The mill that was constructed by contract for the Standard Minerals Co. has been completed and turned over to the company. This plant will treat 50 tons of molybdenum ore daily.

Metcalf.—The store management of the Shannon Copper Co. has advertised its intention of closing, and from this rumors are current that the company will shut-down early in 1919.

Miami.—Inspiration Consolidated pays $2 per share, equal to $2,363,934, on January 27.

Oatman.—In the 'Press' of December 14 it was stated that ore from the Carter mine was being treated in the United Eastern mill. This was incorrect, the mill having been worked continuously at capacity on United Eastern ore since the plant started on January 4, 1917.

Patagonia.—It is rumored that the Magma Copper Co. is completing arrangements for purchase of the Three R mine.

Prescott.—The old Zonia copper mine, 10 miles from Kirkland in the Placeritas district, is again active after being idle over 25 years. Nine men are employed in development at present.

San Simon.—The Hilltop company, in the Chiricahua mountains, has found ore 1900 ft. in the lower level tunnel, which is being driven 300 ft. below the upper workings.

Superior.—It is reported that the Fortuna Consolidated Mining Co. has made a final payment of $18,000 on its holdings.

Silver Bell.—The Stump mine, so called because the copper-silver ore outcrop was uncovered when a Mexican dislodged a stump when gathering fuel, has been sold by G. H. Daily to C. H. Behr of New York for $75,000. A wide vein is said to be exposed to a depth of 75 feet.

CALIFORNIA

Grass Valley.—There are about 1150 men employed in this district. The operating mines are the Allison Ranch, Empire, Golden Center, North Star, Sultana, and Union Hill. By next summer 350 additional men could be employed.

Placerville.—Charles Wachter and Fred Husler are operating a chrome lease on Webber creek, seven miles due west of Placerville. On their leased property they have driven a tunnel more than 100 ft. and sunk a vertical shaft 50 ft., and have opened a large body of high-grade chromite. About mid-December they shipped a 60-ton car of 43% ore. The property is developed so that regular carload shipments can be made for many months. The deposit is a vast kidney-shaped lens within the wide serpentine dike that trends across El Dorado county on a course west of north. The ore is hauled by auto-truck six miles south and shipped from the Shingle railroad station.

Some rich gravel has been opened in the Rising Hope deep-gravel mine, three miles east of Placerville. The channel has been cross-cut for 115 ft., without finding the opposite side of the 'rim'. The thickness is 15 ft. A barrel-gravel mill is recovering $10 per ton. G. W. Engelhardt is manager, C. M. Henson mine superintendent, and G. O. Perry millman.

COLORADO

Georgetown.—The Colorado Central mill is treating 500 tons of ore daily. A steam-shovel is working on the dump.

Lessees at the Capital, Onondaga, Santiago, and Jo Reynolds mines are working on good ore.

IDAHO

Wallace.—The Consolidated Interstate-Callahan company's mill is now concentrating 500 tons of ore daily. C. W. Newton is general manager.

Dividends paid by Coeur d'Alene companies during 1918 were about $3,200,000 less than in 1917, according to the 'Miner'.

MONTANA

Elkhorn.—The Boston & Montana Development Co., through Boston brokers, is offering $400,000 first-mortgage 6% gold coupon bonds of the Montana Southern Railway Co. This line is 39 miles long, between Divide and the Elkhorn mines of the B. & M. company. About 95% of the grading is finished. Rails and rolling-stock have been purchased, and rail laying is in progress. Up to December 1, 1918, there has been spent $478,000, but the total cost will be $700,000. To a depth of 1000 ft. in the mines, the report says, from 600,000 to 800,000 tons of $20 copper-silver-gold-lead ore has been developed. The output is to be 500 tons daily for a start, to be increased to 2000 tons within 18 months.

NEVADA

Ely.—Consolidated Coppermines Co. produced 1,278,116 lb. of copper during November. This is up to the average for the previous months.

Goldfield.—In Tule canyon, 35 miles south of here, lessees are to sink the Ingalls shaft from 300 to 400 ft. Some good ore has been opened, and the dump is expected to supply the 20-ton mill for a year. This plant consists of a crusher, Huntington mill, Wilfley tables, amalgamating-plates, and gas-engine. A. Borcherding, P. J. McDermitt, and F. Hill are the operators.

Tonopah.—Production of the district last week totaled 7381 tons of ore, valued at $125,477. For the year 1918 the yield is estimated at $9,000,000, the product of 500,000 tons. The total to date is $118,000,000. Dividends last year amounted to $1,371,140, paid by the West End, Belmont, Tonopah Mining, Jim Butler, and Extension, ranking in the order given, according to 'The Tonopah Miner'.

In the Divide district, the Tonopah Divide company has opened 6 to 12 ft. of $150 ore. Shares immediately responded, rising to over $2.

NEW JERSEY

Franklin Furnace.—The New Jersey Zinc Co. pays $4 per share, equal to $1,400,000, on February 10.

OREGON

Portland.—The hills of the Coast Range in Clatsop and Tillamook counties contain some valuable mineral ores, according to H. Gilmore Price, who has just finished a mineralogical survey of that region. Two years has been spent in an exhaustive unofficial survey, the report of which will be forwarded soon to the Secretary of the Interior. A large number of samples of gold, silver, lead, and quicksilver ore are to be sent East for analysis.

UTAH

Dividends paid by Utah mining companies during 1918 were as follows, as tabulated by the 'Deseret Evening News' of Salt Lake City:

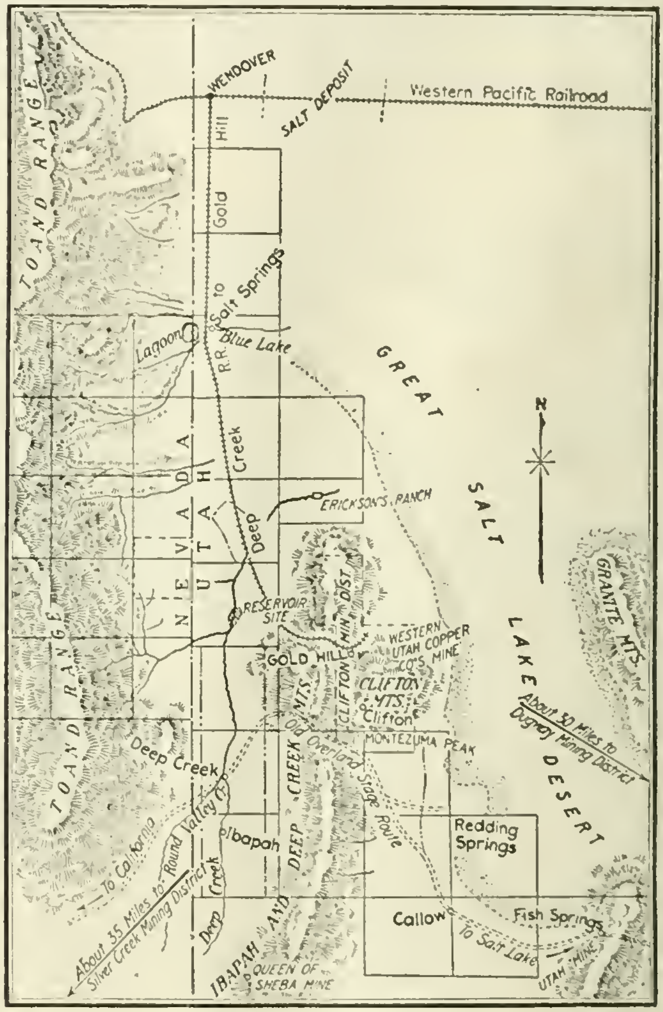
Company	Per share, 1918	Total in 1918	Grand total
Bingham Mines	$2 00	$286 000	$536,250
Cardiff	0 20	100 000	725 000
Chief Consolidated	4 45	397,900	1 234 871
Daly Mining	0 50	75,000	3,060,000
Dragon Consolidated	0 04	75 000	150 000
Eagle & Blue Bell	0 30	270 000	1,161,089
Grand Central	0 12	72,000	1,806,750
Horn Silver	0 05	17,400	5,729,400
Iron Blossom	0 07½	75 000	3,175,000
Judge M & S	0 50	240 000	2,310 000
Ontario-Silver	1 50	225 000	15,187,500
Pacific	0 01	4,000	12,000
Silver King Consolidated	0 10	70 000	1,559,000
Tintic Standard	0 27	317,230	400,480
Utah Apex	0 50	265,000	1,188 000
Utah Consolidated	1 50	450 000	13,417 000
Utah Copper	10 00	16,245 000	91,861 000
Western Utah Copper	0 07½	37,000	37,000
Total		$19,221,530	$143,550,310

Gold Hill.—The Western Utah Copper Co., in the Deep Creek district, has its new 50-ton mill ready to start early in 1919. The plant is at Salt Springs, 18 miles from Wendover. Duncan MacVichie is manager.

Moab.—The Big Indian Copper Co.'s mine and mill have been leased to the Metallurgic Improvement Association for three years. J. E. Barlow of Havana, Cuba, is head of the latter concern, which states that it has devised a process for extracting copper from carbonate ore.

Park City.—The Silver King Coalition company has lost its appeal to the Circuit Court of Appeals, in which judgment of the District Court was in favor of the Conkling Mining Co. The Conkling company was joint-owner of some property adjoining the Silver King Coalition, and alleged that the latter extracted ore worth $500,000 from the jointly-owned property without the knowledge of the Conkling. The judgment rendered was for $542,000, which, with accrued interest, would be about $600,000. The ground in question was worked through the Coalition company's shaft. The defense is to take the case to the U. S. Supreme Court.

Salt Lake City.—In the tax suit in this State between the Utah Copper Co. and 19 others against the State Treasurer, protesting against the collection of the occupation mine tax and seeking an injunction restraining the Treasurer from selling the properties for the alleged delinquent taxes, it was decided to submit the case on its merits to Judge Johnson on January 6.



SKETCH OF THE DEEP CREEK DISTRICT, UTAH

Later advice states that the State Treasurer has answered the complaint of the mining companies, and asks that the proceedings be dismissed, on the ground that the sums involved in the aggregate do not exceed $3000, therefore the matter is not within the jurisdiction of the United States Court. He also asks that he be allowed to collect the taxes.

WASHINGTON

Chewelah.—The United Copper Mining Co. proposes to increase its capital, deepen and extend its workings, and double the capacity of its mills. A plan of expansion will be laid before the directors by Raymond Guyer, consulting engineer. Ore above 1000 ft. is not so good as that at 1200 ft., so mining will be concentrated at depth. Recent diamond-drilling from the 1000-ft. level has been disappointing. The two mills, of 225 tons capacity each, are a quarter-mile apart.

Colville.—The Tulare Mining Co. of California is now shipping 700 tons of calcined dolomite per month. Two kilns are in blast. The product is consumed by the Crown-Willamette paper mills in this State and in Oregon

Republic.—The Quilp Gold Mining Co. is reported to have resumed work after being stopped for several years. To a depth of 600 ft. about 6000 ft. of development was done. The output was $492,843 from 39,653 tons of ore. Unwatering is in progress, while ore is being extracted from the upper levels. W. G. C. Lanskail is in charge.

The Lone Pine-Surprise company is to sink its Last Chance shaft from 550 to 700 ft. Ore shipments will be started again early in February, according to C. P. Robbins, the manager.

The Knob Hill company shipped five cars of ore to smelters during December.

CANADA

British Columbia

Britannia.—The Howe Sound Co. pays 5c. per share on January 15. This amounts to $99,207.

The Bowena Copper Co., whose property is situated on Howe sound, is constructing a concentrating plant with a daily capacity of 100 tons. It is being erected by T. A. Walsh & Co., Ltd., of Vancouver.

Slocan.—The Rambler-Cariboo Mines Co. made a net profit of $20,000 during 1918, according to estimates of its president, A. F. McClaine. Gross returns were $80,000. No dividends were declared in 1918, but the profits have increased the surplus of the company to approximately $50,000.

AMERICAN MINING CONGRESS

The following is a tentative program for organization meeting of the California Chapter, American Mining Congress, January 15 and 16, Palace hotel, San Francisco:

January 15

10:00 a.m.: Address by J. F. Callbreath, Secretary American Mining Congress, Washington, D. C. Subject: Aims, History, and Future of the American Mining Congress.

11:00 a.m.: Address by a Senator or Representative to be selected later. Subject: Relation of American Mining Congress to National Legislation.

12:00 m: Luncheon. Address by James K. Lynch, Governor Federal Reserve Bank. Subject: Relation of Mining to the Banking and Financial Interests of the Country.

2:00 p.m.: Organization meeting.

3:30 p.m.: Address by Thomas Thorkildsen, of Los Angeles. Subject: Non-Metallic Mining Industry of California.

7:00 p.m.: Dinner. Address by Bulkeley Wells. Subject: the American Mining Congress from the standpoint of an operator. Address by H. Foster Bain, Assistant to the Director of the U. S. Bureau of Mines. Subject: The American Mining Congress and the Bureau of Mines. Address by T. A. Rickard, Editor 'Mining and Scientific Press'. Subject: The Effect of Publicity upon Mining.

January 16

10:00 a.m.: Address by Honorable Emmett Boyle, Governor of Nevada. Subject: The American Mining Congress as I saw it in Washington.

10:45 a.m.: Address by David M. Folsom, Ex-Federal Oil Director for Pacific Coast. Subject: Valuation of Oil Lands for Purpose of Federal Taxation.

11:30 a.m.: Business meetings.

12:00 m.: Luncheon. Address by Judge John F. Davis. Subject: The Necessity for a Secretary of Mines as a Member of the Cabinet. Address by Frank B. Anderson, President of Bank of California. Subject: The Attitude of Bankers Toward Mining Investments.

2:00 p.m.: Business meeting.

PERSONAL

Note The Editor invites members of the profession to send particulars of their work and appointments The information is interesting to our readers.

E. M. Rabb is at Tonopah.

Jackson A. Pearce has gone to Dayton, Nevada

Walter Broadbridge is on his way back to London from San Francisco.

Pomeroy & Hamilton have moved from San Francisco to Tulsa, Oklahoma.

C. F. Sherwood, of Salt Lake City, was here this week on his way to Dayton, Nevada.

William S. Evans is now in the engineering department of the Tennessee Copper Co., at Copperhill, Tennessee.

Ott F. Heizer has resigned as superintendent of the Sheep Ranch mine, in Calaveras county, California, and will re-open the Dead Horse mine at Tuolumne, California.

W. D. B. Motter, Jr., has resigned as manager for the Benson Mines Co. to join the staff, as assistant consulting mining engineer, of Guggenheim Brothers, with headquarters at 120 Broadwy, New York.

K. B. Thomas has resigned as superintendent of the sulphuric acid department of the Calumet & Arizona Mining Co. to become general superintendent for the Standard Chemical & Oil Co., at Troy, Alabama.

M. H. McLean, for years general manager of the Detroit copper mines of the Phelps Dodge Corporation, has resigned and will make his home in California. He will be succeeded by **J. P. Hodgson,** who has been with the Copper Queen at Bisbee.

John C. Greenway, who went from Arizona to France as a Major, has been promoted a second time and is now Colonel. He has been awarded the Croix de Guerre for valor in action. Just before the armistice he was gassed and from the effects of it he is slowly recovering. He has done just as his friends confidently expected.

Obituary

Rossiter W. Raymond died on December 31 at his home in Brooklyn, New York, at the age of 78. He was born at Cincinnati in 1840 and after graduating from the Brooklyn Polytechnic Institute he went to Germany, where he was a student successively at Munich, Heidelberg, and Freiberg. He served for three years in the Civil War and attained the rank of captain. Afterward he opened an office as consulting engineer in New York. From 1868 to 1876 he was U. S. Commissioner of Mining Statistics, publishing annual reports that contained technical information of great value to the young mining industry of this country. For 12 years, 1870-1882, he was lecturer on economic geology at Lafayette College. In 1867 he began his career as an editor by conducting the 'American Journal of Mining', which was the forerunner of the 'Engineering & Mining Journal', with which he was connected as editor for several years and as special contributor for the rest of his life. One of the organizers of the American Institute of Mining Engineers, he served as secretary from 1884 to 1911, after having been president in 1872, 1873, and 1874. In 1911 he retired, becoming secretary emeritus. He published a large number of books and pamphlets on a variety of subjects, including poems, children's stories, biblical tales, glossaries, and obituaries, all marked by an incisive style and a broad human interest. We publish an editorial appreciation on another page.

THE METAL MARKET

METAL PRICES

San Francisco, January 7

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	9.50
Copper, electrolytic, cents per pound, in carload lots	23.00
Lead, pig, cents per pound	6.25— 7.25
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb.	$110
Spelter, cents per pound	9.50
Zinc-dust, cents per pound	16.00

ORE PRICES

January 7

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Governoient price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$0.75—$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$17—$23

EASTERN METAL MARKET

(By wire from New York)

January 7.—Copper is inactive and lower. Lead is dull and easy. Spelter is stagnant and prices are nominal.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchaoge. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maxiomum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

The War Trade Board announces that the restrictions hitherto existing on the exportation of tin and tin-plate have been removed, as the necessity for strict conservation of tin and its products no longer exists. If, therefore, applicants will re-file applications for which licenses have been hitherto refused, these will be given immediate consideration.

COPPER

Prices of electrolytic in New York, in cents per pound.

Domestic copper production in 1918 totaled 1,910,000,000 lb., a gain of 24,000,000 lb. over that of 1917. Metal from all sources amounted to 2,450,000,000 lb., an increase of 88,000,000 pounds.

Standard copper, three months, has been sold in London at £88 per ton, equivalent to 18⅝ cents per pound.

The War Trade Board announces that the regulations governing the importation of copper ore and copper concentrates, announced October 4, 1918, have been modified, and that henceforth they will consider applications for license to import copper ore and copper concentrates. There is no restriction upon the importation of copper matte or blister copper.

LEAD

Lead is quoted in cents per pound, New York delivery.

Lead production of the United States last year was 563,000 tons, against 651,156 tons in 1917.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound.

Domestic spelter production in 1918 was 502,300 tons, a decrease of 82,297 tons when compared with 1917. The apparent consumption was 440 000 tons, an increase of 26,000 tons. Stocks at the end of the year amounted to 36,000 tons. There were 123,033 retorts in blast at the end of November.

COPPER PRODUCTION IN 1918

The U. S. Geological Survey gives the following estimates:

Arizona produced about 777,000,000 lb., compared with 712,000,000 lb. in 1917.

The mines of Montana produced 328,000,000 lb., against 274,000,000 lb. in 1917.

Michigan produced 225,000,000 lb., compared with 268,000,000 lb. produced in 1917.

Utah produced 233,000 000 lb., compared with 245,000,000 lb. in 1917.

Nevada produced 105,000,000 lb., compared with 122,000,000 lb. produced in 1917.

Alaska, with a production of about 60,000,000 lb. showed a large decrease from the previous year.

New Mexico produced 98,000,000 lb., compared with 105,000,000 lb. in 1917.

The production of California was considerably above the 48,000,000 lb. produced in 1917.

The production in Tennessee was about 14,500,000 pounds.

Eastern Metal Market

New York, December 31.

The new year opens with all the metal markets unrestricted, except tin and aluminum. Interest in the major metals is becoming keen, and future developments are expected to present many interesting market phases.

The Copper Export Association has set a price of 23c. per lb. for export sales of Lake and electrolytic, and producers are offering the domestic trade at the same level. No sales or demand are heard of.

The tin market continues dull, with offerings of Straits metal at 71.50c., or 1c. under the fixed price.

Lead has again been reduced, but buyers still refrain from the market.

Zinc continues to weaken gradually with demand light.

Antimony is slightly lower.

ALUMINUM

The Government maximum prices are to prevail until March 1, 1919, according to a ruling of the War Industries Board. For virgin metal or for scrap there are 35c. per lb. for 50-ton lots, 33.10c. per lb. for 15 to 50-ton lots, and 33.20 per lb. for 1 to 15-ton lots.

ANTIMONY

Demand is reported as light and quotations have fallen slightly to 7.62½c., New York, duty paid.

COPPER

The interesting development of the last week of the year is the announcement by the Copper Export Association, the new organization to control and promote copper exports, of a 23c. price on Lake and electrolytic copper, or 3c. under the Government maximum price which has been in effect since August 2. No business is reported to have been booked at the new level. The producers are also offering both Lake and electrolytic at 23c. to domestic buyers, with no transactions reported. The market is extremely dull with demand almost entirely absent. Re-sale electrolytic is reported as being offered as low as 22c. in small quantities. We quote the market for both Lake and electrolytic at 23c. nominal for early delivery. It remains to be seen whether the new price will attract either foreign or domestic buyers, or whether, as in the case of lead, still further reductions will be necessary. The estimated domestic output for 1918, reported by the U. S. Geological Survey, is 1,910,000,000 lb., against 1,886,000,000 lb. in 1917. Copper imports are believed to have made a record in 1918 at 566,720,000 lb., against 556,000,000 lb. in 1917. Exports did not make a record in 1918, according to estimates, having been 694,000,000 lb., which is less than the 1917, 1916, and 1914 outgo, but larger than that of 1915.

It is reported that an organization is being formed by brass manufacturers to control the export trade in their business, similar to that of the Copper Association.

IRON AND STEEL

First evidences of slackening activity characterizes the steel trade as the new year opens. There have been shut-downs for repairs, and the prospects are that a further slowing-down may appear. Buying for emergency is plainly not equal to the replacement of what has been lost, though it has been more than was expected by some. Prediction as to rollings for the first quarter range from 75% to somewhat less. Pig-iron producers are trying to hold to the old prices, but there is some indication that $3 will be conceded on new business, with the prospect that some furnaces will have to shut-down. The annual statistics of 'The Iron Age' show that 44 new open-hearth furnaces were completed and put in operation in 1918 with an annual capacity of 1,915,000 tons, against 1,326,000 tons per year for that added in 1917. New steel capacity projected for 1919, as now under construction, represents only 1,130,000 tons per year. Eight blast-furnaces were completed in 1918, with seven building at present.

LEAD

Lead has experienced another drop. On December 27 the American Smelting & Refining Co. reduced its price for the third time to 6c., New York, or 5.70c., St. Louis, a reduction of ¼c. per lb. This was in order to meet the outside market, which had fallen on the 26th to 6c. Re-sale metal is also being offered at these levels. Uncertainty prevails as to whether the bottom has been reached. Some expect no further reduction, with a steady market from now on. Others think it may fall to 5.50c., New York, or until the law of supply and demand is in operation. Dealers are apparently well supplied and consumers heavily stocked.

TIN

Dulness continues to pervade the market, and market developments have been insignificant. The chief of the tin section of the War Industries Board last week asked the secretary of the Tin Importers' Association how much of the tin, allocated to the United States Steel Products Co. and now said to be 10,000 tons, the Association would be willing to take over at cost (72.50c. per lb.) in lieu of an open market. The directors of the Association replied that they were unwilling to consider such a proposition, which would mean a loss to them. It is believed that the orders coming into the U. S. Steel Products Co. for tin are few. Straits tin has been offered in the last week often at 71.50c., New York, which we quote as the market, but buyers have been uninterested. American tin continues to be offered at a concession from the fixed price. All these facts points to a long period of control unless there is some unlooked for and unusual change in the situation. This control will probably be assumed by the War Trade Board after January 1, as the War Industries Board goes out of existence on that date. Arrivals of tin to date for the month total 2530 tons, of which 2450 tons came through Pacific ports.

ZINC

The market has continued to decline, largely because of lack of demand. Inquiry is reported as very light. While large producers do not seem to be pressing the sale of their product, offerings by others have caused quotations to decline, at least nominally, until today prime Western for early or January delivery is held at 7.60c., St. Louis, or 7.95c., New York, with prompt delivery rather scarce and quoted at 7.90c., St. Louis, or 8.25c., New York. The statistical position of the metal is not favorable, according to the weekly reports of the Government as to stocks and output.

ORES

Manganese Alloys: The market continues devoid of activity with prices problematical. Some re-sale ferro is appearing, but no quotation is put on it. It is stated that producers will quote on inquiries $225 per ton, delivered, for 70% alloy, or $3 per unit, making 80% alloy about $240 per ton.

Tungsten: There have been no developments in this market. Prices are really unknown, and there are no quotations obtainable. It is understood that the committee of the trade has ended its labors, its efforts at Washington to obtain relief having been unavailing.

Western States Metal Production in 1918

The following preliminary reports are from the U. S. Geological Survey:

ALASKA

The mines of Alaska yielded in 1918 products worth $28,900,000, according to G. C. Martin. Although Alaskan mining was so adversely affected by shortage of labor and shipping and by the high cost of supplies, that though the value of the output fell nearly $12,000,000 from 1917 the production was still far greater than in any year before 1915. Alaska's chief mineral product is copper, of which 69,426,000 lb., valued at $17,180,000, was mined in 1918. The gold output, worth $10,000,000, of which placers yielded $6,100,000, was $4,650,000 less than in 1917, and was the smallest since 1904. The mining of 77,000 tons of coal, worth $435,000, is significant as the only marked advance over the production of 1917, as by far the largest coal output in Alaskan mining, and as the probable beginning of a substantial coal industry. Alaska also produced silver worth $870,000; tin, $90,000; lead, $85,000; chromite, tungsten, palladium, platinum, and antimony aggregating $117,000; and petroleum, marble, gypsum, lime, and bricks aggregating $120,000.

ARIZONA

The output of gold, silver, copper, lead, and zinc from Arizonan mines in 1918, according to the estimate of Victor C. Heikes, had a total value of $205,500,000, an increase of $3,800,000. There were decided increases in both the copper and the gold of Arizona during the year. The silver output was close to the production of 1917, but the lead was only half as much, and the zinc fell to a small production.

The production of gold gained from $5,068,193 in 1917 to $5,551,000 in 1918.

The mine output of silver decreased slightly, from 6,983,913 oz. in 1917 to 6,787,000 oz. in 1918.

The output of copper increased from 712,166,891 lb. to nearly 777,000,000 lb., but the value decreased from $194,421,561 in 1917 to a little over $192,000,000 in 1918, as the average price of copper decreased from 27.3 to 24.75 cents per pound.

Production of lead decreased from 23,465,445 to less than 13,000,000 lb., and the value decreased from $2,018,028 to $985,000.

The output of recoverable zinc decreased from 20,984,860 lb. in 1917 to about 1,800,000 lb. in 1918. The value decreased from over $2,000,000 to $151,000.

CALIFORNIA

The metal mines of California made an output of gold, silver, copper, lead, and zinc valued at $32,223,500 in 1918, compared with $37,685,985 in 1917, according to Charles G. Yale of San Francisco. This is a decrease of $5,462,500, or 14%.

The output of gold for 1917 was $20,087,504, while the estimate for 1918 indicates a yield of $17,242,400. The deficit is, perhaps, less than had been expected. The number of mines in the State producing gold was 585 fewer at the end of 1917 than at the end of 1912, a loss of 59.7%. In the same period the number of productive quartz mines has fallen off 69%; hydraulic mines, 49%; dredges, 15%; drift mines, 63%; and surface placers, 55%. It must suffice to say that the decrease in number of productive gold mines in California cannot be attributed to war conditions alone.

The silver output from Californian mines in 1918 is estimated at 1,533,000 oz., valued at $1,483,000, compared with 1,775,431 oz. in 1917, valued at $1,462,955. The silver was derived mainly from the copper and lead ores.

The estimated mine yield of copper is 48,538,000 lb., valued at $12,013,000, compared with 48,153,139 lb., and $13,145,807 in 1917. Shasta continues to be the most productive copper county.

The output of lead in 1917 was 21,868,626 lb., valued at $1,880,702; the estimated yield for 1918 is 14,655,800 lb., valued at $1,099,000.

The estimated zinc output of the State in 1918 is 4,697,900 lb., valued at $385,200, compared with 10,872,716 lb., valued at $1,109,017 in 1917.

COLORADO

The mine output of gold, silver, copper, lead, and zinc in Colorado for the first 11 months of 1918 and the estimated output for December, according to data compiled by Charles W. Henderson, amounted to $12,950,000 in gold, 7,120,000 oz. of silver, 64,300,000 lb. of lead, 6,450,000 lb. of copper, and 85,200,000 lb. of zinc, having a total value of $33,260,000; compared with $15,849,302, 7,304,350 oz., 67,990,000 lb., 8,122,000 lb., and 118,200,000 lb., respectively, having a total value of $41,988,935, in 1917.

As predicted in the Survey's six months' review issued in July, the production of Cripple Creek fell from $10,394,847 in 1917 to $8,294,000 in 1918.

IDAHO

The value of the gold, silver, copper, lead, and zinc mined in Idaho in 1918, according to the estimate of C. N. Gerry, was $38,140,000, a decided decrease of $16,700,000 from the value in 1917. The decrease was marked in all the metals but gold, as well as in the total value of the output. Even the value of the silver, which increased in price during the year, was less by more than $600,000.

The gold yield increased from $804,809 in 1917 to $867,000 in 1918.

The output of silver decreased from 12,029,338 to 9,595,000 oz., an unusual decline of nearly 20%, and the value from $9,912,175 to $9,286,000.

The output of copper decreased from 7,827,574 to 5,195,000 lb., and the value from $2,136,928 to $1,286,000.

The output of lead, which is the most abundant metal in Idaho decreased from 393,559,521 lb. in 1917 to 300,274,000 lb. in 1918. The average price was somewhat lower, and the value of the output decreased from $33,846,119 to $22,760,000.

The output of recoverable zinc decreased from 79,854,136 to 47,000,000 lb. One of the main decreases was made by the largest zinc producer—the Interstate-Callahan.

OREGON

A preliminary estimate of the production of metals in Oregon in 1918, compiled by Charles G. Yale, of the San Francisco office of the Survey, shows a decrease only in the yield of gold with an increase in that of silver, copper, and lead. The output of gold in 1917 was $1,491,798, and the estimated output in 1918 is $1,270,300. The silver output in 1917 was 125,656 oz., valued at $103,541, while in 1918 it was 148,200 oz., worth $143,500. The yield of copper in 1917 was 2,474,487 lb., valued at $675,535, and in 1918 it was 2,935,000 lb., valued at $726,400.

MONTANA

The value of the gold, silver, copper, lead, and zinc mined in Montana in 1918, according to the estimate of C. N. Gerry, was more than $122,000,000, an increase of $12,000,000. There was a decided decrease in the gold output, but increases in all other metals.

The value of the gold output decreased from $3,517,253 in 1917 to $3,177,000 in 1918, in spite of the fact that gold from copper ores probably increased. One of the main reasons for this difference was the decreased output from the Conrey dredges in Alder gulch, Madison county. Gold from the mines of the Barnes-King company was also much less than in 1917, though the company is still one of the chief gold producers in the State. The Southern Cross mine, at Georgetown, from which iron ore is shipped, was the third largest gold producer of Montana. Some rich ore came from the Scratch Gravel mine, in Lewis and Clark county.

The output of silver increased from 13,128,142 to 16,000,000 oz., and the value from $10,817,589 to $15,600,000. This makes Montana the leading silver producer of the United States.

The output of copper increased from 274,462,571 lb. in 1917 to 328,000,000 lb. in 1918. This represents a gain of nearly 54,000,000 lb. in quantity and over $6,000,000 in value. However, the increase was unusual, as the year 1917 was not a normal one, the main properties being idle several months.

The production of lead increased from 21,951,220 lb. in 1917 to 35,000,000 lb. in 1918, the value increasing from $1,887,805 to $2,668,000.

The output of recoverable zinc in Montana increased from 186,259,331 to 210,000,000 lb. The value increased from $18,998,452 to $19,551,000. The three main zinc producers of Montana were the Butte & Superior, the Anaconda, and the Elm Orlu.

Dividends paid by Montana companies for the first 11 months of 1918 amounted to $19,745,870. The principal dividend-payers were the Anaconda, North Butte, Butte Copper & Zinc, Davis-Daly, and Barnes-King.

NEVADA

The value of the gold, silver, copper, lead, and zinc mined in Nevada in 1918 was over $45,000,000, according to preliminary figures compiled by Victor C. Heikes. This is a decrease of over $9,000,000 from the output of 1917, when the mines produced $54,424,580. The decrease was general, and in point of value the largest drop was that in copper, amounting to over $7,000,000.

The gold output decreased from $6,959,468 in 1917 to $6,700,000 in 1918. This is a comparatively small decrease when the isolation of the fields and the excessive costs are considered. Gold from the Tonopah district was also decidedly lower, amounting to $1,200,000. Gold producers of the State that had an output of more than $200,000 each were the Nevada Consolidated from copper ore, Aurora Consolidated, White Caps at Manhattan, Elko Prince, Olymplc in Mineral county, Union Consolidated at Virgina City, and the Rochester Mines at Rochester. Other notable gold producers were the Round Mountain, Nevada Wonder, Dahl placer, Consolidated Virginia, Comstock Leasing, and Consolidated Coppermines. There was a decided decrease in gold from the Seven Troughs district and from Churchill county. As a result of developments at depth on the Comstock lode, that district produced more than $400,000 in gold.

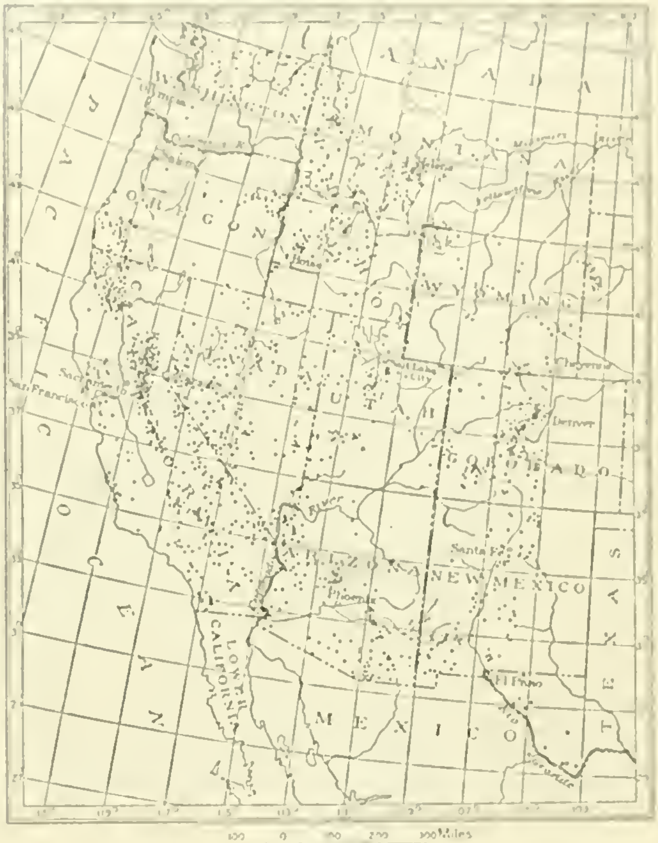
The mine production of silver decreased from 12,269,969 oz. to 10,000,000 oz. in 1918. The value of the output, however, increased from $9,286,454 to $9,687,000. The largest output of silver, or about 5,800,000 oz., was from the Tonopah district.

The output of copper decreased from 122,794,704 to 105,000,000 lb., and the value from $33,522,954 to $26,000,000.

The output of lead decreased from 27,677,928 to 20,600,000 lb., and the value from $2,380,302 to $1,567,000. One of the largest lead producers in the State was the Prince Consolidated, at Pioche, which shipped iron-manganese ore containing gold, silver, and lead. From the Yellow Pine district of Clark county considerable high grade lead ore was shipped.

The output of recoverable zinc decreased from 22,307,86 lb. in 1917 to 15,000,000 lb. in 1918. The value of the output declined from $2,275,102 to $1,267,000. Nearly all of the output came from the Yellow Pine district, though there was a distinct decrease from this region.

Dividends declared by Nevadan mining companies for the first 11 months of 1918 amounted to $7,574,458. The principal contributors were the Tonopah Belmont, Tonopah Mining, Nevada Consolidated, West End, Boss, Jim Butler, Union Consolidated, Yellow Pine, Nevada Wonder, Rochester Mines, Tonopah Extension, and Nevada Packard.



MAP OF WESTERN STATES, SHOWING GENERAL DISTRIBUTION OF MINING DISTRICTS. (U. S. G. S.)

NEW MEXICO

The output of the mines of New Mexico for the first 11 months of 1918 and the estimated output for December, as reported by Charles W. Henderson, amounted to $681,000 in gold, 868,000 oz. of silver, 9,250,000 lb. of lead, 98,620,000 lb. of copper, and 25,000,000 lb. of recoverable zinc, valued in all at $28,625,000; compared with $1,067,969, 1,453,454 oz., 9,501,000 lb., 105,568,000 lb., and 30,200,000 lb., respectively, with a total value of $31,986,765, in 1917. These preliminary figures thus show decreases of $387,000 in gold, 585,000 oz. in silver, 251,000 lb. in lead, 7,000,000 lb. in copper, and 5,200,000 lb. in zinc.

The decreased output of gold and silver was general throughout the State. Mills of the Mogollon district, Socorro county, yielded $115,948 in gold and 312,000 oz. of silver, compared with $258,620 in gold and 722,644 oz. in silver in 1917. This district in 1916 yielded $373,068 in gold and 1,008,483 oz. of silver.

Copper, the principal metal product of New Mexico, is produced in several districts, the greater part of the output coming from Chino Copper Co.'s deposit at Santa Rita. The

Burro Mountain Copper Co.'s operations at Tyrone were continuous.

Lead ores were shipped from the Central and Steeplerock districts, Grant county, and the Cooks Peak and Victorio districts, Luna county.

Decreased shipments of zinc carbonate and zinc sulphide ores were made in 1918. At Kelly, Socorro county, the principal producing mines were the Kelly, Graphic, and Juanita. The Ozark mill was operated steadily, but the Kelly mill was not in operation. At Hanover, zinc-carbonate ores were shipped from the Empire zinc mines and others, and zinc-sulphide concentrates were shipped from the Hanover magnetic-separation mill. The Cleveland magnetic-separation mill, at Pinos Altos, was operated steadily but at a reduced yield. In September, the Carlisle mill, in the Steeplerock district, Grant county, was again set in operation; the lead concentrates were shipped, but the zinc concentrates were stored.

SOUTH DAKOTA

The mines of South Dakota produced in 1918 gold worth $6,853,000, compared with $7,364,233 in 1917, and 164,000 oz. of silver, compared with 186,765 oz. in 1917. In addition, 67,000 lb. of lead and 90,000 lb. of copper were produced from smelting ores shipped. These are preliminary estimates, reported by Charles W. Henderson.

The yield from the Homestake mills fell off approximately $400,000. For several years the Homestake mine has been supplying ore to its stamp-mills—numbering 1020 stamps—without interruption, but in October 1918 this company was forced to shut-down 100 or more stamps. Of the other important properties the Golden Reward mines and cyanidation mill were closed in the spring of 1918, owing to advances in cost and low-grade ores. The Wasp No. 2 mill was dismantled; the New Reliance was idle; the Bismarck mill was operated for a short period only; the Mogul mine continued operation on custom ore. The Trojan mill and mines were active. Small shipments of lead-silver ore were made from Galena and of copper ore from Roubaix and Hill City.

Placer mines in Custer, Lawrence, and Pennington counties were not actively worked.

TEXAS

The Presidio silver mine, in Texas, was in continuous operation during the year 1918, according to Charles W. Henderson. Desultory mining was also carried on in the Van Horn and Sierra Blanca districts, and several shipments of copper ore were made from deposits in the 'red beds' of Foard and Knox counties. The result was a small output of copper and lead, and an output of silver of 590,000 ounces.

UTAH

The output of gold, silver, copper, lead, and zinc from the mines of Utah in 1918, according to Victor C. Heikes, had a value of $87,600,000, which represents a decrease of nearly $12,000,000 from the value in 1917. Except in silver, the production of which increased slightly, there were decreases in all five of the metals produced. The industry in general was greatly hampered by the scarcity of labor and the unusually high cost of materials and supplies.

The four smelting-plants of the State were active throughout the year, on both Utah and custom ores, but they were not run at full capacity during the entire year and no records were made.

The production of gold dropped from $3,355,156 in 1917 to approximately $3,000,000 in 1918, a decrease of nearly 10%. Most of the gold came from copper, lead, and zinc ores treated at smelting-plants. No great quantity of ore was either amalgamated or cyanided.

The output of silver increased from 13,479,133 oz., valued at $11,106,806, in 1917 to about 13,680,000 oz., valued at $13,200,000, in 1918. Although this is not a large increase in quantity, it is rather surprising that the output was upheld, inasmuch as there were decided decreases in all the other metals.

The production of copper decreased from 246,674,153 lb. in 1917 to 233,000,000 lb. in 1918.

The output of lead declined from 178,521,958 lb. in 1917 to 162,000,000 lb. in 1918, a decrease of over 9%.

There was a decrease of 20% in the production of recoverable zinc. The mine output decreased from 21,286,871 lb. in 1917 to 17,500,000 lb. and the value of the output from $2,171,261 to $1,454,000.

In 1918 the mines of Utah produced approximately 14,606,000 tons of ore, a decrease from 15,358,481 tons in 1917. Of this total, the Bingham district yielded 13,978,000 tons, against 14,150,394 tons in 1917. There was a decrease in the Tintic district, where 41 mines produced 344,000 tons of ore, exclusive of iron ore, against 392,386 tons in 1917. Shipments of ore and concentrate from the Park City region in 1918 amounted to 90,000 tons, a decrease from 96,516 tons in 1917. Tabulation of the important mines gave an estimated output for the district of $77,395 in gold, 2,626,000 oz. of silver, 918,000 lb. of copper, 24,064,000 lb. of lead, and 2,650,000 lb. of recoverable zinc. The decrease was general, but the largest decline was in lead. Tooele county mines produced 99,000 tons in 1918, against 132,048 tons in 1917. About 39,000 tons of ore was shipped from the Big Cottonwood, Little Cottonwood, and American Fork districts, against a total of 51,813 tons in 1917. In Beaver county, shipments increased from 64,532 tons in 1917 to 67,000 tons in 1918. This included the large amount of low-grade lead tailings shipped by the Caldo Mining Company.

WASHINGTON

The value of gold, silver, copper, and lead mined in Washington in 1918, according to the estimate of C. N. Gerry, was $1,654,000, a decrease of $635,000. There were slight increases in both silver and copper, but decided decreases in gold, lead, and zinc. The copper output in the Chewelah district, Stevens county, was not greatly changed, but there was a marked decrease in the shipments of silicious ore from the Republic district, in Ferry county. Washington mines suffered from the general scarcity of men and high cost of operation. The price of silver was considerably higher, but the average prices of copper, lead, and zinc were less than those of 1917. The copper smelter and refinery at Tacoma and the lead plant at Northport were both active throughout the year, but toward the end the Northport plant was not operated at full capacity.

The output of gold decreased from $492,324 in 1917 to $341,000 in 1918, a decrease of nearly 31%. The greater part of the gold came from the Republic district, but there was a distinct decrease in ores amalgamated throughout the State.

The output of silver increased from 282,320 oz. to 320,000 oz. and the value from $232,632 to $310,000. About half the silver came from copper ores, and most of the remainder from Republic ores.

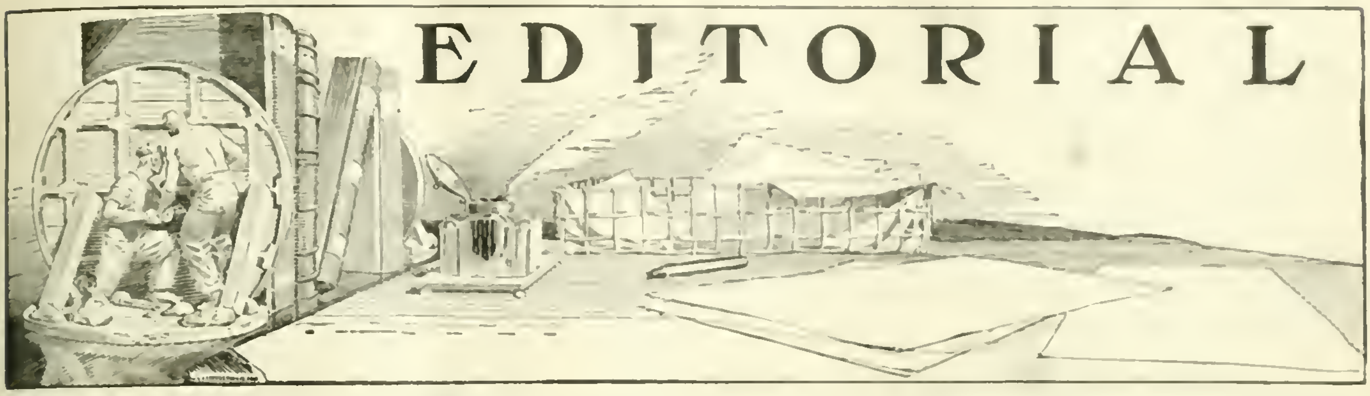
The copper output increased from 2,199,518 to 2,322,000 pounds.

The mine output of lead decreased from 9,789,687 lb. to 5,600,000 lb. Most of the product came from the Electric Point mine, near Northport, in Stevens county.

Washington mines made no shipments of zinc ore or concentrate during the year, although in 1917 they produced over 1,000,000 lb. of spelter.

The only dividend paid by Washington mines during the first 11 months of 1918 was that of the Electric Point company.

EDITORIAL



INDEX to Volume 117 is now ready and can be obtained by asking for it.

THE Supreme Court of the United States has denied the Minerals Separation company's motion for an order restraining the Butte & Superior Mining Company from disposing of its assets pending the decision in the main case, which is set for hearing on March 3.

CALCREOSE, the remedy for influenza described on another page, is made by the Maltbie Chemical Company, at Newark, New Jersey, as we note from the bottle sent to us by a friend in New York. We have used it successfully at home. The writer of the article is Dr. Baldwin.

GOVERNOR BOYLE of Nevada has taken a hand in the labor trouble at Ely. Mr. Emmet D. Boyle was a good mining engineer before he proved himself a capable State executive and we have high hopes that he will be successful in adjusting the dispute between the Nevada Consolidated Copper Company and its employees.

HERMYINGUI is the name of the premier wolfram mine in the world. It is in the Tavoy district of Burma. In 1917 the owners of the mine, Marshall Cotterell & Company, shipped 1063 tons of concentrate; in August 1918 the Hermyingui—we linger on this charming name—produced 120 tons of wolfram concentrate, containing about 65% tungstic oxide.

SPEAKING of returning soldiers, we venture to ask for suitable employment in behalf of a young man that served for three years with the Canadian Expeditionary Force and was so badly gassed that he must live in a warm and dry climate. He held the rank of sergeant major and is well fitted for the post of store-keeper or a similar job. Will some friend in Arizona, New Mexico, or southern California give him a chance?

FROM Boston comes the suggestion that the Panama Canal be re-named in honor of Theodore Roosevelt. The idea is a good one. The Canal was a big thing, done in a big way, under the leadership of a big man. To President Roosevelt we owe the pushing of the work and the completion of the water-way. It was a thoroughly American feat of engineering and it should be worthily linked with the memory of the greatest American of this generation.

IN our issue of December 21 we published an editorial on the proposed merger of the two mining engineering societies. The information came to us in the form of a circular, and we had no inkling that it was of a confidential character, but we are informed now that the circular was confidential, and that our editorial comment was untimely. We regret if, even unwittingly, we contributed to a breach of confidence, and hope that the incident will in no way interfere with the completion of the merger.

THE question is still asked, 'Who killed Cock Robin?' and the scribes of the daily press are perspiring in their efforts to answer the conundrum. Some of them, in their patriotic fervor, see only one conqueror of the Huns, as if the job had not required several hands, and as if there were not credit enough to go around. To them we commend the statement issued by the British War Office on November 11: "After fifty-two months of war, France with the aid of her allies has succeeded in defeating the enemy."

FRANKLIN K. LANE has been mentioned in connection with the presidency of the University of California. Those who care for the welfare and usefulness of that splendid institution will welcome the suggestion that the present Secretary of the Interior be invited by the regents to become its chief executive. Mr. Lane has all the qualities needed for the position. He is a man of constructive ability, large vision, and engaging personality. He is an alumnus of the University, a citizen of commanding experience in big affairs, in touch with the main currents of thought, and peculiarly fitted to act as an interpreter of university ideals and activities to the public. Such a man would be a sympathetic link between the University and the people of the State.

IT is reported that for 11 months of 1918 more than 325,000 men and women in California alone secured employment through the Employment Service of the United States Department of Labor. This help is rendered by the Government free to both employee and employer. Every kind of occupation is included, manual and professional. We are glad to give what aid we can to this excellent work, the importance of which will be greatly emphasized during the demobilization of our military forces. The managers of mines, mills, and smelters in need of help of any kind may secure for themselves the benefit of this service either through this paper or by communicating direct with the Employment Service of the United States Department of Labor, 806 Claus Spreckels Building, San Francisco.

SAN FRANCISCO exported silver to the value of $200,918,373, or 203,143,247 ounces, during the past year. Of this amount no less than 161,295,559 ounces went to British India, 'the sink for silver', as it has been called by economists. China took only 22,752,279 ounces, but an increased absorption by that country of teeming millions may be anticipated as the natives develop a taste for the luxuries of a more complex mode of living. To the missionaries the miner is under great obligation, for it is owing to their teachings and the consequent enlightenment of the natives that we owe the expansion of the market for silver. Our friends at the mines ought to contribute cheerfully to the foreign missions and to similar beneficent organizations for converting the heathen. The danger of any accumulation of surplus silver in the United States is gone, the Orient will take all that our West can produce. No metal is in so assured a position as silver is today.

WE venture to tell a Roosevelt story that we have not yet seen in print. When the ex-President was passing through London in 1910, a luncheon in his honor was arranged by the late Ambassador, Walter Hines Page, whose son, Mr. Ralph Page, is our authority for the story. Mr. Roosevelt was asked to suggest those whom he would like to meet; he prepared a list of twenty names, comprising men of naval and military distinction, publicists, politicians, and others, among whom were included two persons whom the embassy people were with difficulty able to find, namely, a Hebrew scholar and an expert on moths. When the hour of the luncheon arrived, the younger Mr. Page went down the line of guests, introducing each in turn to Mr. Roosevelt. He greeted each person cordially and engaged in a short conversation with him, discussing his own special subject, although the "discussion" consisted chiefly in Mr. Roosevelt telling them something they ought to know. He told the naval man something new about naval strategy, he corrected the military expert in something he had written, he told the politicians what errors England had made in Egypt or India, and then he came to the two men last on the list. Turning to the Hebrew scholar, he asked him how he would translate a certain passage in the Hebrew scripture. The learned man told him. "You are entirely wrong," said Roosevelt, "it ought to be done in this way." He explained his reasons for preferring his own version, and the professor felt impelled to express his polite acquiescence. Finally, he set eyes on the lepidopterist, a seedy-looking individual, with moth-eaten clothes; "Have you ever seen the Catacola Fraxini [or some other scientific name]?" "No, I never have; it is exceedingly rare, and is only reported from the upper reaches of the Amazon [or some other remote locality]." Thereupon Roosevelt beamed triumphantly and told him that he had seen it, he described it minutely, to the delight of the other fellow. The encyclopedic range of information and the amazing mental agility of the Colonel astonished all those present.

REPRESENTATIVE ELSTON'S resolution in Congress advocating the purchase of Lower California and of contiguous territory in northern Mexico is nothing new, for in February 1916 Representative Randall, another Californian Congressman, introduced a resolution to the same effect. The proposed 'purchase' appears, however, to be a parliamentary camouflage for making Mexico pay for the expedition to Vera Cruz and the chase of Villa in Chihuahua, besides the loss of life and property to Americans during the Mexican revolutions. A reckoning with Mexico must come some day, we presume, and when it does come the cession of Lower California would be one way of adjusting the account. Lower California covers 58,328 square miles; it is an arid region, not without mineral resources, for in the Boleo copper mine and the Progresso silver mine it has two notable sources of metallic wealth, but it is a little amusing to read a newspaper description that credits this desert country with the climate of Italy. Under Señor Esteban Cantu's strong governorship this part of Mexico has been spared the vicissitudes of government under the various 'istas and peace has persisted throughout the period of Mexican misrule. The transfer of Baja California to the United States would stimulate mining on the peninsula. We note the opening, a few days ago, of the new highway between Tiajuana, on the border of this State, and Mexicali, the capital of Lower California.

Theodore Roosevelt

The flag flies at half-mast; and well it may, for one who stood for all that the flag symbolizes has passed from the stage of human action. The sudden death of a man so intensely vital was a shock in more than the conventional sense: even to a world grown callous to the sight of the dying it was a blow to think of Theodore Roosevelt as quiet in the sleep that knows no waking. We had learned to think of him as a dynamic element in American life and some of us were still hoping that he might be spared for official leadership in national affairs; we regarded him as a tonic to jaded politics, as a stimulant to robust patriotism, as a spur to independent thinking. Now the great silence has laid hold upon him, the strong voice is hushed, the vigorous arms lie folded, the ardent spirit is quenched, and the mighty hunter has crossed that range from which no traveler returns.

"A great American" they call him; all of them say that—his friends and his enemies; presidents and kings, statesmen and politicians, editors and scholars. Indeed he was "a great American". His greatness lay in the bigness of his heart and the catholicity of his mind; he knew not fear, physical or moral; to him a lion in the path or a great wrong in the community were alike an object of the chase, to be vanquished single-handed if no help offered; whether other enemies lay in wait for him in the jungle of either Africa or politics he cared not at all, he would attend to them in due course with unconquerable ardor and conviction. Mankind loves a brave man. As a cowboy in North Dakota, as a legislator in New York, as Police Commissioner of Manhattan, as Colonel of the Rough Riders, as President, he faced any odds joyously. Even in his retirement he was irrepressible, and when the critical hour came at the beginning of the War he did not hesitate to take sides for the right, nor, as soon as his country drew the sword, did he delay to offer either his own services or those of his gallant sons. Although the supreme honor of leading American soldiers in battle with the Hun was denied to him, he lived long enough to see his four sons 'make good'—an American phrase that fits exactly. When one of them died fighting and another was wounded in action, he received the sad news as Theodore Roosevelt should. History will record the fact to his credit that he foresaw our participation in the War and that he urged preparedness for it; he had the gift of statesmanship: to foresee the event. He preached Americanism and he lived it. His last public utterance, which was read at a meeting of the American Defense Society the night before his death, was an eloquent plea that there might be "no sagging back in the fight for Americanism merely because the War is over." He was American in his faults as in his virtues. Outspoken, expansive, impulsive, careless of precedent, supremely egoistic, sometimes offensively belligerent, he may have had English blood, Dutch blood, French blood, even German blood, in his veins, but it had long ceased to be a mechanical mixture; it was that chemical compound we call American because it is different from any of the ingredients of which it was composed. His chief fault was in subordinating his heart to his head, his feelings to his reason. For differences of opinion he had a large tolerance, for diversity of feelings he had no charity whatever; hence his violence in controversy. He was not self-opinionated to his friends; on the contrary, he was willing to listen to advice and to follow it. As President he availed himself of such aid continually, particularly in law and economics, for neither of which he had any liking. His wide vision and keen idealism were controlled by a large stock of common-sense, as well as bedrock morality. Thomas B. Reed, the Speaker of the House, said, "Roosevelt has discovered the Ten Commandments," meaning that he had taken them out of the Sunday-school into the political arena. He enriched American literature not only by his writings, which were the unaffected expression of himself and therefore in good style, but by the words and phrases that he coined. Even if he had never been President or Colonel of the Rough Riders his fame would be preserved in our language by such phrases as 'the big stick', 'the strenuous life', and 'the square deal', or by such terms as 'mollycoddle', 'pussy-footer', and 'muck-raker'. He had a capacity for making enemies, but it was as nothing compared to his gift for friendship. The devotion of his followers was a reproach to the cynics. He had the kingly faculty for remembering those that had done him the slightest good turn; when he became famous and powerful he delighted to recognize the humbler comrades of the ranch and the camp; to them he was 'Teddy' and 'the Colonel' until the very end. He was as beloved by the staff at the White House as he was by his fellow-townsmen at Oyster Bay, and in the telegrams of condolence showered upon his sorrowing wife were as many from the simple and the unknown as from the rulers of the nations. His was a happy lot; he was fortunate in his birth and education, in his wealth and health, in finding a field for his activities, in achieving the highest political ambition, in winning the affection of millions and in dying before he was old. Every part that was assigned to him he played with undiluted sincerity; he was a devoted husband, a good father, an upright citizen, a just magistrate, a brave soldier, a fearless hunter, and an honest politician. As President Wilson has said, in a tribute of singular felicity, "his private life was characterized by a simplicity, a virtue, and an affection worthy of all admiration and emulation by the people of America." He was an elemental figure, a complete man. Under all the obvious traits there was strong character, sound common-sense, and an intellectual moderation that guided him in the far-reaching changes introduced by him in his efforts toward social reform. The torch that he held over the corrupt places of internal politics was grasped by the firm hand of a high-minded patriot, not the feverish fingers of an anti-social incendiary. "Put out the light, please," were his last words. The light is extinguished at last and deep is the gloom in which it leaves his fellow-citizens, but the whole world is the brighter for the presence of his vivid personality. America has been ennobled for all time by the tradition of his manliness, and the steps of human progress have been illumined by the torch-bearer who has gone now through the open door into the night. "He was a man; take him for all in all, we shall not see his like again."

Mr. Lane and Americanization

On another page we publish a part of the annual report of the Secretary of the Interior. Such an official paper might be expected to be dull, probably statistical, and almost certainly out-of-date. Our readers will be undeceived as soon as they read the first paragraph, which strikes a vibrant note of human interest. We are glad, even in a technical periodical, to give so much space to this discussion on Americanization by the Secretary of the Interior, because Mr. Lane is held in affectionate regard by Californians and in great respect both in his own State and throughout the country. That respect will be heightened by his treatment of a vital subject, namely, the making of Americans out of the immigrants that seek shelter and a home in this country. He asserts truly that in challenging the world to political idealism we have incurred the responsibility of proving to the world that we know how to develop the character of our own democracy. We must be purposeful at home as well as abroad. Our destiny depends chiefly upon the development of the character of the individuals that make the nation. The War has taught the value of national spirit and of co-operative effort. In organizing for war we used the draft for mobilizing our man-power and in so doing we discovered an extraordinary number of young men who were unable to speak our language. Ability to speak English—to think in it—is a condition precedent to Americanism. Mr. Lane gives some startling figures to show how far that condition is lacking. One fact that he mentions deserves to be underlined; he says that the average teacher's salary is less than that of the average day-laborer. A democracy that pays its school-teachers less than its hod-carriers is making a fundamental blunder. The fact that men and women will accept the work of teaching for small pay does not excuse us for giving such pay as attracts only second-rate people to become teachers. The instructors and educators in a democratic scheme of living ought to be among the best paid of public officials because their work is of basic importance. Inadequate instruction and ineffective education are the deadly enemies of representative government, particularly in communities in which a meretricious and ignorant press becomes the principal source of information and suggestion to the average man or woman. More especially is it our duty and opportunity to see that the ignorant immigrants from overseas are trained for American citizenship so that they can be absorbed into the body politic without causing a fit of political dyspepsia. The existence of a large mass of unassimilated aliens in the United States does impair the good health of this commonwealth, by affording facilities for the cultivation of the noxious germs of anti-social ideas. The immigrant may be an economic asset if he works, but he is a political liability if he remains alien. The rampant anarchy of the I. W. W. and the irreconcilable elements in the Socialist party are largely the result of our failure to exclude the undesirables of Europe and of our dereliction of responsibility for those that land at our ports. Restriction of immigration, which should have been taken in hand long ago, has gone only so far as to exclude those likely to be a public charge, those obviously insane, epileptic, afflicted with contagious diseases, or otherwise seriously defective, also those known to be criminals, prostitutes, or procurers, together with such as acknowledge themselves to be anarchists or polygamists. In 1916 we deported or debarred 21,773 of the unfit, but no anarchists were turned away. Such sifting of immigration was begun too late, and, whatever may be done to restrict entry in the future, there remains the task of making the most of those already admitted. Of the white population of this country, 45% is foreign-born or of foreign parentage. In the mining regions entire communities are foreign in speech and in ideas. Mining engineers can testify that they have walked for miles on the Mesabi range before meeting a man that could tell them the way in English; they have been in parts of the South-West where Spanish only is spoken, in parts of Wisconsin where German is the common tongue, and in parts of Minnesota where Swedish is the dominant language. Such conditions are deadly to the growth of an American spirit. As Theodore Roosevelt said, in his last public utterance: "We have room for but one language here and that is the English language, for we intend to see that the crucible turns our people out as Americans of American nationality and not as dwellers in a polyglot boarding-house." An American may be compounded of many racial stocks, as the great ex-President was, but he must fuse them into one if he is to be a real American, and of all the fluxes that will melt unlike racial ingredients into the good metal of pure nationalism there is none like the flux of language. The most remarkable democracy of the ancient world was that of Athens; it was a success because, among other reasons, it was only a town and all the Athenians spoke Greek. The United States is a continent and its very bigness renders solidarity more difficult to attain unless all its citizens speak the same language. By means of it we can achieve a common understanding, by aid of it we can teach the immigrant the essentials of citizenship. Lack of national unity gave the Bolshevists the chance to destroy the Russian attempt at democracy; let us see to it that, through carelessness, we do not become the victims of the anti-social element that is constantly threatening to undermine the development of the democratic idea in this country. One of the first steps toward the Americanization of our foreign laborers is to start classes in English in our mining communities. Now that men work for eight hours only, it should be practicable to make arrangements with the local Board of Education for ensuring that every foreigner may have at least an hour's lesson in English every day. Another aid to the same purpose would be to employ educated English-speaking foreigners on the staff of mines and mills, so that the foreign element may be represented, thereby promoting a better understanding between the management and the foreign workmen, and arousing a proper ambition among the more intelligent of them. As Mr. Charles M. Schwab said recently: "The thing that we have got to do is teach, not patronize." The War has awakened the American people to a keen realization of the necessity for assimilating our alien people, not by naturalization only, but by teaching them the English language and by inoculating them with American ideas, which is the first requisite to real citizenship. To quote again the stalwart American just gone from us: "There must be no sagging back in the fight for Americanism merely because the War is over. There can be no divided allegiance; we have room for but one soul-loyalty."

International Control of Minerals

By COURTENAY DE KALB

It is creditable to the Administration that, though tardy in realizing the significance of economics as a basis for making peace and maintaining peace, it seems at last to have grasped the fact that economics is a rock and that politics is a quicksand. It is to be hoped that the evidence of an awakening to a wiser view of international relationships does in truth mean that such a realization has come to the men who are now guiding our destinies, for good or ill, through the difficulties of a world-conference for the re-writing of international law to make feasible a closer association under a modern *jus gentium*.

The original party of peace delegates that went abroad was wholly political, diplomatic, and legal. It is said that Colonel House of Texas had been directing an elaborate historical research by State Department officials, to serve as a basis for dealing with the problems of the European re-association of nations. This was, of course, useful and necessary. Knowledge of the intricate aspirations, grievances, and propensities of the many States in Europe was needed in order to deal intelligently with the demands that will be made, and to comprehend the influences that will subtly work at cross-purposes to the superficial current of peace when the delegates begin their deliberations. The political side of the problem is not to be ignored; it is, indeed, of vital import, and in the end will prove to be the side that determines most of what the Peace Congress will accomplish. This, however, does not prevent a clear vision of the fact that a political adjustment will have the defect of a structure built on the sands, and that it might have been founded on the rock of economics had all parties been so minded. A recent despatch from Paris assures us that the new spirit will be that of a concert of nations, rather than the maintenance of the balance of power. This may mean progress, for the old balance was not a compensated mechanism, and disaster followed; but there was a period when Europe tried the principle of a concert also, especially as regarded Mediterrean affairs, and after the last appearance of the players on the Greek stage at the time of the Cretan trouble, it was universally admitted that the European concert was a dead failure.

A new conception has now dawned, and it may lead to better things in course of time. Instead of starting with an economic basis as the determinant of the political relations that should exist between the nations, it is now proposed to admit economic considerations in designing the framework of an association of nations. Accordingly three men have been called to Paris, each of whom is specially equipped to render useful service in economics. These men are Bernard M. Baruch, representing productive industry, Vance McCormick, representing international trade, and C. K. Leith, representing international control of minerals. The lessons of the War, which were lessons in mobilizing resources, have developed surer knowledge of the interdependence of nations upon fundamental raw materials. So far as minerals are concerned, this experience in war has accumulated in the hands of Dr. Leith a fund of new knowledge, which he has outlined in a bulletin just off the press, to appear ultimately as part of the 'Mineral Resources' for 1917, when issued shortly by the U. S. Geological Survey. Some of the leading statements in this bulletin will set many minds thinking upon things that will soon be reflected in the utterances from Versailles. Dr. Leith states that the annual world production of minerals is approximately 1,700,000,000 tons, over 90% of which is coal and iron. Of this amount one-third figures in international trade. The world movement is characterized by a remarkable degree of concentration. For instance "manganese moves from three principal sources and converges at four or five consuming centres; chromite moves from two principal sources; tungsten also from two. The world movement of coal is controlled by the United States, England, and Germany." He draws the following general conclusion: "The convergence of these materials toward a few consuming centres indicates concentration of coal production necessary to smelting, high development of manufacturing, large per capita use, concentration of facilities, strong financial control and, not least, a large element of enterprise which has taken advantage of more or less favorable conditions."

The pre-war movement of minerals was hindered by tariffs, trade-control, and various types of monopoly. It conformed to the law of supply and demand as determined and influenced by artificial efforts at concentration for control and stimulated industrial effort at certain points. The net result was enterprise from which the principle of equality of opportunity was excluded. The War wrought great changes. The total annual imports of mineral commodities into the United States were reduced by 1,200,000 tons. The flow of manganese from India and Russia ceased abruptly, and we turned to Brazil and to our own resources to supply the deficiency. Curtailment of chrome imports led to the development of a domestic supply. Pyrite was no longer available from Spain, and this gave a great impulse to the operation of our own mines of pyritic ores and of sulphur.

One important result of the changed conditions was the creation of an Inter-Allied Purchasing Committee, with branches in London and Paris, to agree on the distribution and price of nitrate, tin, tungsten, platinum, and many other minerals and metals. Thus new problems of concerted action for world-allocation became part of the business of the nations. Dr. Leith presents the deduction from experience obtained during the War in these words: "We now face the immediate and pressing question whether the centralized international control required by the War shall be retained or extended as a means of furthering the aims of a league of nations. When such a league was first proposed emphasis was placed mainly on political and military considerations. It now seems to be recognized that these are so closely interlocked with economic considerations that any league of nations, to be effective as a means of minimizing future international discord, must make provision for some degree of international or supernational control of business. Recent statements by officials of Great Britain and France seem to indicate a definite purpose to urge such control."

The concrete conceptions of the international need for mineral control are set forth in the succeeding paragraphs:

1. Equitable distribution of certain minerals, such as gold, tungsten, vanadium, and platinum, of which there may be a world shortage.

2. Ensuring equality of opportunity in regard to basic raw materials, as against the national monopolies now existing with reference to some mineral commodities.

3. To reach an agreement for a division of the market for iron, steel, coal, and some other vital necessaries.

4. To maintain an equilibrium of price.

5. To centralize control over the restraint of trade that is now accomplished through tariffs and other means for national monopoly.

The proposals for international agreement on principles of world economics, as outlined in the paper by Dr. Leith, enter into details of general application, and represent ideas that mainly originated in America. That they will be strongly modified in contact with the delegates from France, England, and Italy is indubitable, but it is significant of the point of view that is being carried to Paris, not only by Dr. Leith, but by his close associates, Messrs. Baruch and McCormick, as the expression of a conception with which America will be assumed to be in accord. What this is may be seen from his following statement: "Extension of international control of minerals seems to offer possibilities of loss and gain—loss through a considerable sacrifice of national trade and a narrowing of the field for private initiative in trade; gain through the possibility of attaining certain ends which are attainable only by international agreement, such as an allocation of supplies. The interests of conservation clearly require international control. Moreover, the lesson of the War points to the necessity of overhauling old international understandings and machinery, even though such a task would encounter great difficulties, not the least of which lie in the persistence of human habits and inertia. . . . The mineral industry should fully understand that, with international control, efforts to promote export will need to be modified and curtailed; that expansion of our trade in many lines will mean equivalent loss of trade to other nations; that the almost universal conception that expansion of foreign trade is a meritorious aim and end in itself, without regard to its effect on other countries, will need revision."

With the intent of developing the ideas presented in this brief bulletin, by collecting further information relative to the world requirements and movements of minerals, a plan is now being perfected for the transfer of the special mineral activities of the War Boards to the Bureau of Mines and the Geological Survey. It is also recommended that "the American Institute of Mining Engineers and our technical publications have the same reason for extending their current surveys of mineral conditions to cover the world."

The invitation to co-operation by extra-governmental organs of influence will not be neglected. The issues involved are so vast, so vital, and in some respects so revolutionary, that every serious person will urge immediate response. The MINING AND SCIENTIFIC PRESS has persistently swept far beyond the confines of our single country, in its criticism and efforts for the welfare of the mining world. The Iron and Steel Institute has been drawn into close association with the Government, in an advisory, and partly in an administrative capacity. The American Institute of Mining Engineers has performed useful functions of an advisory character, and has co-operated helpfully in mobilizing the mining engineers for military service, and its experience as a body of representative managers of industry should be made available for the constructive work that is now, in some degree, to be undertaken in giving an economic platform to the league of nations.

A platform designed chiefly by men whose business is politics is a dangerous construction, albeit they may employ some practical artisans in the work of erection. A platform is always liable to collapse, and the multitude is then found considerably injured in the débris. The dominant note that has been struck so often by the apostles of the League of Nations, considered as a political institution, also vibrates through Dr. Leith's paper on the problem of mineral control. There is wisdom in it, as a broad theory, and sincerity of purpose. No criticism of idealism is valid except as the ideal is competent to function as a force in itself rather than to promote evolution of the body politic. The idealists, represented primarily by the President, have been warning the people of the need for economic sacrifices as an international discipline, and this has been done in the face of very definite statements from France and England of a practical sort, such as one would meet in the banking house rather than at a conference of government ministers. The security of the world's peace is an economic question, and acquiescence in the control established between the nations will depend upon the economic advantages it may offer. The Administration, through many of its agencies, has revealed insufficiency of constructive thinking upon economics by its frequent announcement of the sacrifices that must be made to achieve the international ideal. The true bond would be one that made it economically advantageous to sustain a new order of international unity, and equally disadvantageous economically to secede from the league. The object of a closer linking of the nations must be for an uplift of mankind, and that means the maintenance of the higher standards of living. This does not call for sacrifice, because sacrifice of economic effort means sacrifice of earning capacity, which is retrogression. The measure of prosperity is found in the ratio between productivity and consuming power. As Dr. Leith indicates, this does not necessarily depend upon the balance of foreign trade for or against a people; but progress requires that the ratio be not unity, but rather an over-weighting of the productive factor. Without that the re-absorption of capital into the invested form for betterment and expansion is not feasible, and a condition of balance therefore is toppling toward decline and weakness. Aside from accumulations for insurance and to cover accidental wastage and loss, a balance may be the ideal; it assuredly is the ideal of the conservationist school of thought to which Dr. Leith belongs. In the end, which, speaking in terms of the life of the race, may be remote, the principle of the economic balance may rule. On the way to a realization of such an ideal, however, another type of conservation must be upheld, which is the preservation of the standard of living of the most highly evolved nation, and that necessitates the leading upward of those less highly developed, taking the average of all classes into account, to the more elevated plane. The industrially successful, the well-requited of the industry in which they work, are those that first and last achieve the broader, happier, and more wholesome conception of life and duty. We would prefer to risk opening new mines in America to provide the means for more and happier homes here in our own country than to suppress the industry that lies nearest to the hands of willing workers, on the chance that in some corner of the globe a man who could produce the same metals a little cheaper might find it possible to divert his labor from something else to competition with the men in our own land of high development and high achievement.

That gold has been sold recently at a premium is well known, so it is of interest to note that the Oriental Consolidated in its statement for October says, "The above bullion [$91,856] was shipped to the Imperial Japanese Mint at Osaka for refining, after which it will be turned over to E. H. Hunter & Co. of Osaka, who pays us a 2% premium on the gold. Last month we included the premium in the clean-up figures, but we have now decided to discontinue this system, as such a 'falsification' of the bullion figures reacts throughout all our ore valuation and extraction data, and would render them inaccurate. The premium will from now on be included among 'other receipts'."

Antimony mining in Alaska has almost ceased owing to the low price of the metal.

Californian Mineral Output in 1918

The statistical division of the State Mining Bureau, under the direction of Fletcher Hamilton, State Mineralogist, estimates the mineral production of California for the year 1918 at a total of $191,100,000. This is a conservative figure, and includes all products, metallic and non-metallic, being in advance of the actual figures which will be available later after the complete returns are received from the various producers. The continued increased value over the 1917 total of $161,202,962 is due mainly to the greatly enhanced prices of all grades of crude oil, coupled with an increase of approximately 5,000,000 bbl. in quantity. Reports to hand indicate a decrease of nearly $3,000,000 in gold output, and considerable decreases also for lead and zinc. Copper apparently increased slightly in quantity, but decreased in value. Quicksilver dropped off 2000 flasks in quantity, but with a higher price per flask, so that the total value of $2,310,000 showed a relatively smaller loss.

Of the so-called 'war minerals,' chromite had a large output up to the latter part of September, when the market collapsed. Otherwise, California's 1918 shipments bade fair to eclipse the record output of 52,379 short tons in 1917, worth $1,130,298. The actual tonnage finally shipped was probably about the same as the 1917 total, but with a greater value per ton. Shipments of manganese ores are estimated to have reached a total of 25,000 tons, worth $1,125,000, a considerable increase over the 15,515 tons and $396,659 in 1917. Magnesite apparently dropped off to about 90,000 tons, or only 40% of the previous year's yield, on account of the competition of the cheaper iron-bearing Washington magnesite and the curtailing of construction work that utilizes high-grade magnesite for plastic purposes.

The date of publication of the final and complete report on the mineral production for the year is dependent upon the promptness of the replies from operators. But for the delayed replies of less than 10% of the operators, partly carelessness, the complete report could be compiled inside of three months after the close of the calendar year, instead of at least six months usually taken. The law requires that reports must be made to the State Mining Bureau, and should be complied with promptly. Details of the individual returns are held confidential.

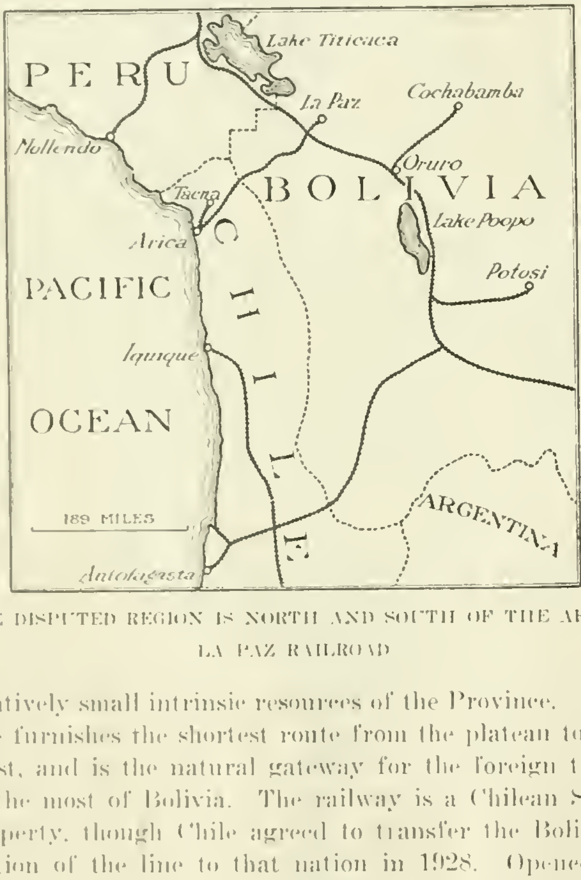
The estimated quantities and values for 1918 are tabulated as follows:

Substance	Quantity	Value
Gold	....	$17,250,000
Silver, ounces	1,500,000	1,450,000
Tungsten concentrates, tons	2,300	3,000,000
Copper, pounds	40,000,000	12,000,000
Lead, pounds	15,000,000	1,100,000
Zinc, pounds	4,500,000	375,000
Quicksilver, flasks	22,000	2,310,000
Antimony, iron, molybdenite, platinum	....	90,000
Petroleum, barrels	100,000,000	123,000,000
Chromite, tons	52,000	2,000,000
Manganese ore, tons	25,000	1,125,000
Magnesite, tons	90,000	900,000
Natural gas	....	3,000,000
Brick, cement, stone, rock, etc.	....	10,000,000
Salines (borax, soda, salt, potash)	....	12,000,000
Sundry industrial minerals	....	1,500,000
Total value		$191,100,000

Minerals in the Disputed Chile-Peru Territory

The region of Tacna and Arica, which is the cause of the acute frontier controversy between Chile and Peru, is, in itself, of comparatively small economic value. The Province of Tacna, as organized by the Government of Chile, has an area of 8688 square miles, mostly lying among the western foothills of the Andes. Like most of the contiguous coastal regions, it is arid, except where it can be irrigated from the scanty and intermittent streams that rise in the Andes.

The most important feature in the industrial life of the region is the Arica-La Paz railway, rather than the relatively small intrinsic resources of the Province. This line furnishes the shortest route from the plateau to the coast, and is the natural gateway for the foreign trade of the most of Bolivia. The railway is a Chilean State property, though Chile agreed to transfer the Bolivian section of the line to that nation in 1928. Opened in 1913, its traffic has increased rapidly, from 47,000 tons in the first year of operation to 105,000 tons in 1917. It has, however, been hampered by inadequate rolling-stock and by the lack of port facilities at Arica. Efforts have been made to remedy the shortage of rolling-stock by purchases in the United States, and the Chilean government has ratified projects for the improvement of the port works. This railway supplies the principal channel for the increasing Chilean economic activity in Bolivia. Chileans are heavily interested in the Corocoro copper field, the Llalagua tin mines, the Socavón tin mines near Oruro, and the large properties of the Compañía Minera y Agrícola Oploca, in the Province of South Chichas, Department of Potosí. Chilean capital is also interested in the development of the petroleum field in the Santa Cruz country of eastern Bolivia, and in the possibilities of Bolivia as a market for the surplus product of Chile's expanding manufacturing industries.



THE DISPUTED REGION IS NORTH AND SOUTH OF THE ARICA-LA PAZ RAILROAD

The topography of the Province bears, in the main, a resemblance to that of the contiguous coastal regions. Most of its area is occupied by the western foothills of the Andes, whose continuity is, however, broken by the existence of barren and relatively level pampas. These are crossed from east to west by several quebradas, or narrow closed valleys, which serve as beds for the scanty and intermittent streams that rise in the Andes.

In 1916 the mineral production of the Province of Tacna was valued at P1,687,563 (exchange-rate, 1 peso =30 cents) compared with P143,724,951 for Tarapaca, and P250,658,239 for Antofagasta. Thus the mineral production of Tacna amounted to only a little more than a third of 1% of the total production of all Chile for that year.

The mineral product of 1916 was classified as follows, with its quantity and value:

Gold (dust), 9340 grammes	P11 049
Copper ore, 722 metric tons	171,373
Ores containing gold, silver, and copper, 906,261 kilogrammes	193,950
Ores containing molybdenum, 1652 kilogrammes	16,520
Ores containing tungsten, 102 kilogrammes	140
Gold contained in copper ore, 2165 grammes	1 949
Silver contained in copper ore, 141,315 grammes	5,772
Sulphur, 8579 tons	1,201 060
Salt, 2450 tons	85,750

The total value in U. S. currency is approximately $550,000.

Contrary to the current impression, Tacna is not one of the nitrate provinces, as this industry is largely confined to Tarapaca and Antofagasta, the two Provinces to the south.

Sulphur comprises about 71.2% of the total value of the mineral production of Tacna for 1916. It is in fact the most valuable single resource of the region. The solfataras of Tacora are among the most important in the world. The deposits are estimated to hold from 10,000,000 to 45,000,000 tons of sulphur. The exploitation of these vast beds has been greatly hindered by lack of capital and proper transportation facilities.

A distinction must be drawn in considering the traffic of the port of Arica between the specifically Chilean trade and the Bolivian transit trade. As at both Mollendo and Antofagasta, the Bolivian government maintains at the port a customs agent, who takes charge of goods destined for Bolivia, and expedites their transportation across Chile. Bolivian exportations through Arica for 1915 can be classified as follows:

Antimony	P68 800
Bismuth	7,220
Copper:	
Barillas (concentrate)	7 189,763
Minerales de cobre (ores containing copper)	6,657,189
Silver:	
Cemento de plata	1,065,152
Minerales	50,529
Sulphur of molybdenum	4,500
Tin:	
Barillas	12 708,000
Barras	870
Wolfram:	
Barillas	2,300,384
Minerales	4,500
Lead: Minerales	14,500
Total	30 181,931

The total value in U. S. currency is approximately $9,000,000

The above notes are abstracted from 'Commerce Reports'.

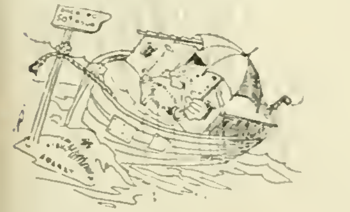
The Salesman

By CHARLES T. HUTCHINSON

WHEN Eve disposed of the apple to Adam, she qualified as the first salesman, or perhaps, saleslady would be better. Indeed, the apple proved to have been a lemon, as the ills to which all flesh has been heir ever since will bear abundant testimony. The serpent was the first advertising man, whose full-cap headlines and masterful composition so forcibly sold the apple idea to Eve, and then to Adam, that selling, with all its ramifications, lights, and shades has been an inseparable part of our scheme of existence ever since.

From then on, through the time when Noah was compelled to tie up at Ararat on account of tire troubles, the science of salesmanship grew and grew. The first expense account for entertaining is found in the sad case of Esau, who sold his birthright for a mess of pottage. This handy adjunct to salesmanship, the psychology of the full stomach as a first-aid to the persuasiveness of the glib-tongued salesman, is just as much a part of the game as the wise old serpent of advertising and the sales talk of Eve.

From the sonorous tomes of the Old Testament to the slang of the cities, at heart it is the same old story repeated in never-ending variety and cadence. The men who go out on the job with quips, knights of the gripsack, armed cap-a-pie with price-book, order-blanks, and a pocket full of cigars, move the output of the world of factory and farm, and do it well.



The drummer, in the eyes of those who know not, lives a charmed life. He is a hail-fellow—well-met with everybody. He fairly exudes optimism and good nature. His pockets are always full of cigars—good ones too—and his first words are, "What are you going to take?" He travels everywhere, knows everything, and, rumor has it, all expenses are paid, actually PAID, and gladly, by a complaisant boss, who loves his little drummer, and cares for him as he would a rare exotic in the conservatory of hired men. This genial, rather stout, red-faced young man, in clothes like the collar 'ad' in the magazines, is the favorite of the gods, and takes off his hat to no man. "What a cinch!" thinks Rollo, the high-school freshman, who then and there decides that, come what may, he will be a salesman when he grows to man's estate.

There are salesmen and salesmen. There is the vendor of peanuts on the street corner, whose plaintive piping steam-whistle is as significant of his calling as the striped pole that proclaims the barber. The beautifully tailored exquisite with the air of Lord Cholmondeley, who, with raised eyebrows expresses his contempt when you inquire for the fifty-cent counter at the fashionable jewelers, and the man who barks "Where to," when you approach the ticket-window at the railroad depot, all seem, in a way, to absorb a certain atmosphere from the nature of their calling. Their varying attitudes toward those they serve, from haughty disdain to servile adulation, are an index to the amount of competition they must face.

These are all salesmen, so called, but really, salesmen for such worthies is a gross libel upon an honorable and intricate calling. They are order-takers, not order-getters, and there is a vast difference between the two. Again, there is the new profession, that of sales-engineering, wherein the sales engineer is a creator, a builder, and must have, not only a highly trained technical and commercial brain, but the sales temperament as well, a quality as rare as that of music, art, or any of the other gifts not to be acquired from books.

Each particular kind of selling is a specialty in itself. The successful vendor of delicatessen would not make much of a job at selling ball-mills to a copper mine, and vice versa. However, it is not with delicatessen, ready-to-wear garments, or breakfast food that this article will deal. Let us talk of something of which we know, the mining machinery salesman. Solomon, with all his wives, had no problems such as his.

There is no fixed method by which the ability of any salesman may be determined before a trial, nor is there any physical peculiarity by which any man may be said to be, literally, a born salesman. There are almost as many types as men. There are fat ones and lean ones, loquacious ones and monosyllabic ones. Some achieve such sartorial eminence as to be worthy of the appellation, 'swell dressers', while others are downright shabby, and neglect the occasional shoeshine and haircut. Nevertheless, in each, somewhere, there is that indefinable something that produces the signature on the dotted line. Employment managers, psychologists, phrenologists, and other intellectual highlights have promulgated innumerable fads and fancies whereby the round and square pegs may be classified and placed in exactly the kind of holes for which they are temperamentally fitted, but none of these handy formulas for the solution of the human equation amount to much where the selection of salesmen is concerned. Some years ago a young man, then heralded as an advanced intellectual genius, and since determined to have been little other than a disgusting German propagandist, used to determine the ability and adaptability of prospective employees by running $\frac{1}{32}$ contours all around their craniums and calculating the distance between their medulla oblongata and their pneumogastric nerve, and saying, when the answer was found, "My boy, you are a born machinist's helper, the fish-oil for yours." But, when you want to hire a salesman, test him by seeing whether he can sell himself to you. If he can, let him try to sell something to your customers. Your sales report will tell the story; your bank account will furnish the answer.

The salesman of mining machinery is a reflection of those with whom he deals. It could not be otherwise. As he gets deeper and deeper into the toils, he assimilates the viewpoint of the mine manager, in some cases even aping his picturesque manner of expression and characteristic taste in dress. Once upon a time, there was a young man called Smith (which was not his name). Said Smith found for himself a job with a local manufacturer of mining machinery. As he progressed from job to job, his superiors thought they discerned in him the spark of genius as a salesman. Smith, naturally imitative, took to aping the bluff heartiness, the superior swagger, and debonair bearing of the road salesmen, who, back from their trips, filled his head with their Munchausen tales of glorious accomplishment, and how they 'put it over' their envious rivals.

It was not long before he became so efficient an understudy that the boss decided to give him a chance 'on his own'. The great news told, Smith, beside himself with joy, rushed out to the nearest outfitter in order to prepare himself, not merely to be, but to look a mining machinery salesman. The next morning he put in his appearance at the office and nearly caused a riot. He was, like the 'Sassy Six' automobile, fully equipped with

A four-dent Stetson nearly three feet wide,

A pair of knee-length lace-boots,

A pair of flowing brown corduroy trousers, coyly tucked into said lace-boots, and, last, but not least,

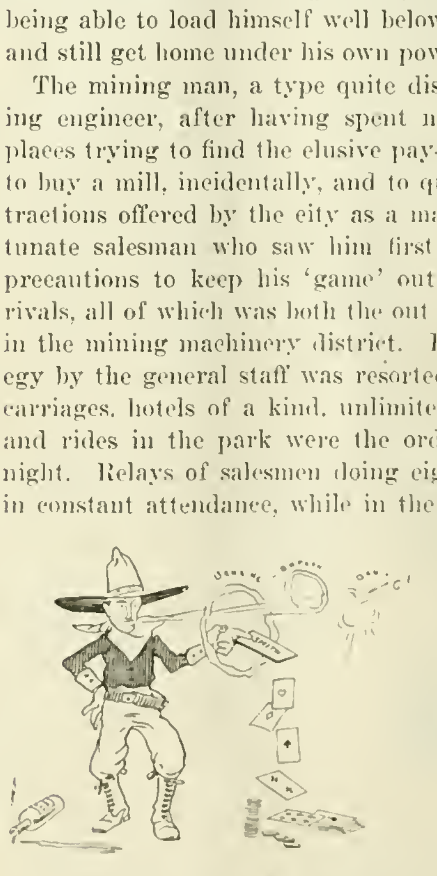
A benzine-tainted breath, as a symptom of his acquisition of an expense account.

Smith got fired, which, in a way, was not quite fair to Smith, whose imaginative temperament caused him to mistake the Dare-devil-Dick dime-novelistic yarns of the salesmen for the real literature of salesmanship.

Shakespeare once wrote something about the garb proclaiming the man, which may account for the paper cap and pile of shavings used so frequently by the cartoonist in depicting a horny-handed son of toil, yet, many an excellent mechanic comes to work in a cut-away coat and a hard-boiled hat of the derby variety. Every mine manager does not attend receptions in lace-boots and a khaki shirt worn decolleté, and every salesman does not rely upon John Barleycorn as his chief talking-point, nor camouflage his expense account. As a matter of fact, the best salesmen, those who have the analytical faculty and regard nothing as sold until it is in satisfactory operation, look like other humans and act like them.

John Barleycorn, as a first-aid toward making sales, is fast coming into disrepute in well-ordered business establishments. Time was, not so many years ago either, when no salesman could get away with his job without being able to load himself well below the Plimsoll mark, and still get home under his own power.

The mining man, a type quite distinct from the mining engineer, after having spent months in the waste places trying to find the elusive pay-shoot, came to town to buy a mill, incidentally, and to quaff deep of the distractions offered by the city as a major duty. The fortunate salesman who saw him first took extraordinary precautions to keep his 'game' out of the bags of his rivals, all of which was both the out and in-door pastime in the mining machinery district. Extraordinary strategy by the general staff was resorted to, wherein closed carriages, hotels of a kind, unlimited credit at the bar, and rides in the park were the order of the day, and night. Relays of salesmen doing eight-hour shifts were in constant attendance, while in the office, specifications and contracts were being rapidly typed in preparation for the psychological moment when the signature might be appended to the dotted line.



When the mining man reached that state of satiety when nothing looked so good as a pitcher of ice-water and a cold compress, the contract was produced, wearily signed, and the used-up conqueror of the desert and the mountains journeyed back to pure air, flapjacks and bacon, to await the coming of the mill that would demonstrate the existance either of a mine or of just another hole in the ground.

The best thing about such methods, and the salesmen that went with them, is that they are gone. Gradually, better business morality grew, not merely with the vendor but also with the vendee of mining machinery. The American passion for efficiency expressed itself with the summary curtailment of the expense account privilege, whereby close scrutiny by a cold-blooded person known as an auditor eliminated such items as 'sundries', under the cloak of which many indiscretions were formerly hidden. The cause of all this betterment is, of course, education, a more intelligent conception of responsibilities. The mine manager of today is a trained man, usually a university graduate, and so is the mining machinery salesman. Practice is applied with the logic of the thinker to the solution of the problem at hand, whether that problem be one of ore deposits and metallurgical treatment, or design and manufacture of apparatus. One large manufacturer of mine supplies exacts from his employees a signed pledge to abstain from alcoholic liquors during the period of their employment. Commercial hospitality, such of it as still remains, takes the innocuous form of an occasional lunch, dinner, or theatre party. The old-time orgies no longer have place; in fact, the easiest way to put the salesman out of the running would be to try and put over something of this kind.

There is a certain amount of regret, that in the passing of the old methods, and old salesmen, is also going the general practitioner. Ten or fifteen years ago, the mining machinery salesman was the whole show. He was expected to handle the job from soup to nuts, from caviare to demi-tasse. He could diagnose ore, draw up the specifications for the plant, both machinery and building material; prepare, unaided, the complete construction estimates as well as the cost of the machinery; go out and get the contract signed in competition with a lot of rivals; come home with the scalp of the mine manager under his belt and a check for the first payment; see the job through the shop, and, if necessary, take charge of erection of the machinery; turn the completed plant over in running order, and then, last but not least, come home, tired but happy, with a formal acceptance and a check for the final payment.

The tendency toward specialization to the *n*th degree has revolutionized the methods of the manufacturer of machinery and of his selling force. In the old days, the mining machinery manufacturer used to make everything in sight, not merely milling, concentrating, and smelting machinery but the power equipment, engines, boilers, compressors, rock-drills, in fact, nearly everything that went to make milling or smelting plants as they were in those days. Now practically everything in a modern mill or smelter is manufactured by a specialist and sold by a specialist salesman.

Great establishments for specialized manufacture have been built up, international in their scope, whose selling organization and trade connections penetrate the far corners of the earth. In the old time sense of the word, there are very few manufacturers of mining machinery any more, but instead there are manufacturers of air-compressors, hoisting-engines, ball-mills, concentrators, transmission machinery, power apparatus of each kind, and so forth. In the equipment for a modern mine will be found the product of dozens of specialty manufacturers, and many dozens more, when such details as belting, hose, pipe, valves, and fittings are taken into account.

The same transition has produced the specialized salesman, who knows air-compressors, but not ball-mills, concentrators, but not internal-combustion engines. One objection to this specialization lies in the divided responsibility. No one contractor can guarantee the performance of the plant as a whole. On the other hand, the highly developed concentration upon one piece of apparatus has resulted in an infinitely superior product than that turned out by the old-time jack-of-all-trades. A firm of consulting engineers, purchasing equipment a few years ago for a plant of considerable magnitude, interviewed some two hundred manufacturers' representatives before deciding upon the equipment that would be used. Under the old order of things, half-a dozen bidders would have sufficed.

The salesman is himself a specialist, a sales engineer in fact. He has a concentrated knowledge of his own apparatus in many cases far superior to that of the consulting engineer, who, himself, is a general practitioner, whose duty it is to co-ordinate all the various units into one efficient plant. As a result, the sales engineer is consulted with respect by the consulting engineer, and has a large voice in the selection of the apparatus; in fact, there are lots of consulting engineers whose reports would lack much without the sound knowledge imparted by the sales engineer.

The sales engineer gets no fee for professional services. He is supposed to be a sordid commercial person, who, by reason of the fact that he has something to sell, has his advice and counsel used, but not paid for. The consulting engineer collects the fee. If the sales engineer lands the order for his principals, well and good. If not, he turns to other prospects.

Many of the larger manufacturing establishments, appreciating the increasing responsibilities developing upon the sales engineer, have given much thought to his training. Young graduates in engineering courses from the universities are taken into the manufacturing establishment and put through a regular course of training, and are paid for their time as well. Generally two years are devoted to shop practice in various departments, supplemented by lectures in the evening by department heads on pertinent subjects. During the training period, the candidate absorbs a thorough practical knowledge of the manufacturer's product, and what is even more important, the spirit of the institution, morale, in other words: the inspiration without which no sales engineer can put heart into his work.

The observance of rigid standards of personal conduct are insisted upon; representatives, not mis-representatives, are wanted by the modern business establishment. Of the many cases of business turpitude and unfair competition investigated by the Federal Trade Commission during the period of the War, it is noteworthy that, of the offenders designated as such by the Board, comparatively few were American concerns, and further, that it was found that unfair competition, graft, bribery of officials, and other forms of business dishonesty were characteristic business methods of the Germans wherever they hung out their signs.

A few reactionary narrow-minded persons are prone to sneer at modern methods of sales promotion as a developer of natural resources because, forsooth, the motive inspiring the salesman is commercial rather than altruistic. This viewpoint is the sheerest nonsense. Things to be successful must be profitable, morally or financially. Things, schemes, and ideas must be able to withstand the acid test of practical application: they must pay; if they do not, they are failures. The salesman too must be made to pay. He cannot be made to pay, without, in turn, paying those with whom, and for whom, he deals. A salesman who introduces a piece of apparatus that renders good service to the user and a profit to the maker is doing a real constructive service; he is doing his bit toward making the world a better place for the rest of mankind.

ORGANIC CHEMISTRY is the chemistry of the compounds of carbon. The number of compounds that contain carbon is extraordinarily large. The only other elements that enter into the composition of any large number of substances are hydrogen and oxygen. Carbon is the dominant element, remaining intact in many of the chemical changes that occur, while hydrogen and oxygen are added, subtracted, or exchanged for other elements or groups of elements. Most of the compounds of carbon are decomposed at temperatures below a red heat. The majority of organic substances are practically insoluble in water, while compounds are more sensitive to light and air than are the inorganic. Most organic substances are practically insoluble in water, which is the solvent of so many inorganic compounds.—J. T. Stoddard in 'Introduction to Organic Chemistry'.

THE TERM 'MANGANESE ORE' is used to denote ore that contains 35% or more of metallic manganese, and 'ferruginous-manganese ore' to denote ore that contains 35 to 10% of metallic manganese and 10 to 40% of iron. Ore containing less than 10% of metallic manganese is known as 'manganiferous-iron ore.'

The Oil-Shale Industry in Colorado

By R. L. CHASE

I had the good fortune to spend two months in the oil-shale country of Colorado this fall and found many things of interest that are worth noting, especially as so many wild stories have been circulated in regard to the shale. The district I covered is reached from Grand Valley, a station on the Denver & Rio Grande railroad, thence by good motor-road up Parachute creek to its forks as shown on the map, which also shows the line of outcrop of the shale cliffs.

All the available shale has been covered by placer locations in this district, those claims having cliff-faces being the most valuable on account of offering the best and cheapest working conditions. A supply of water and timber is necessary, especially the water, as large quantities are used in retorting the shale.

No. 1. Looking down Parachute creek, all the bottom-land being taken up by prosperous ranchers. The mesas measure the extent of oil-shale, the valley being practically at the bottom of the formation, then 1500 ft. of oil-shale, the top of the mesas being capped by a buff-colored sandstone in places several hundred feet thick.

No. 2. Mountains of oil-shale showing the weathering, which goes on very fast, the cliffs breaking down into the talus-slopes. Rock falls from the cliffs daily.

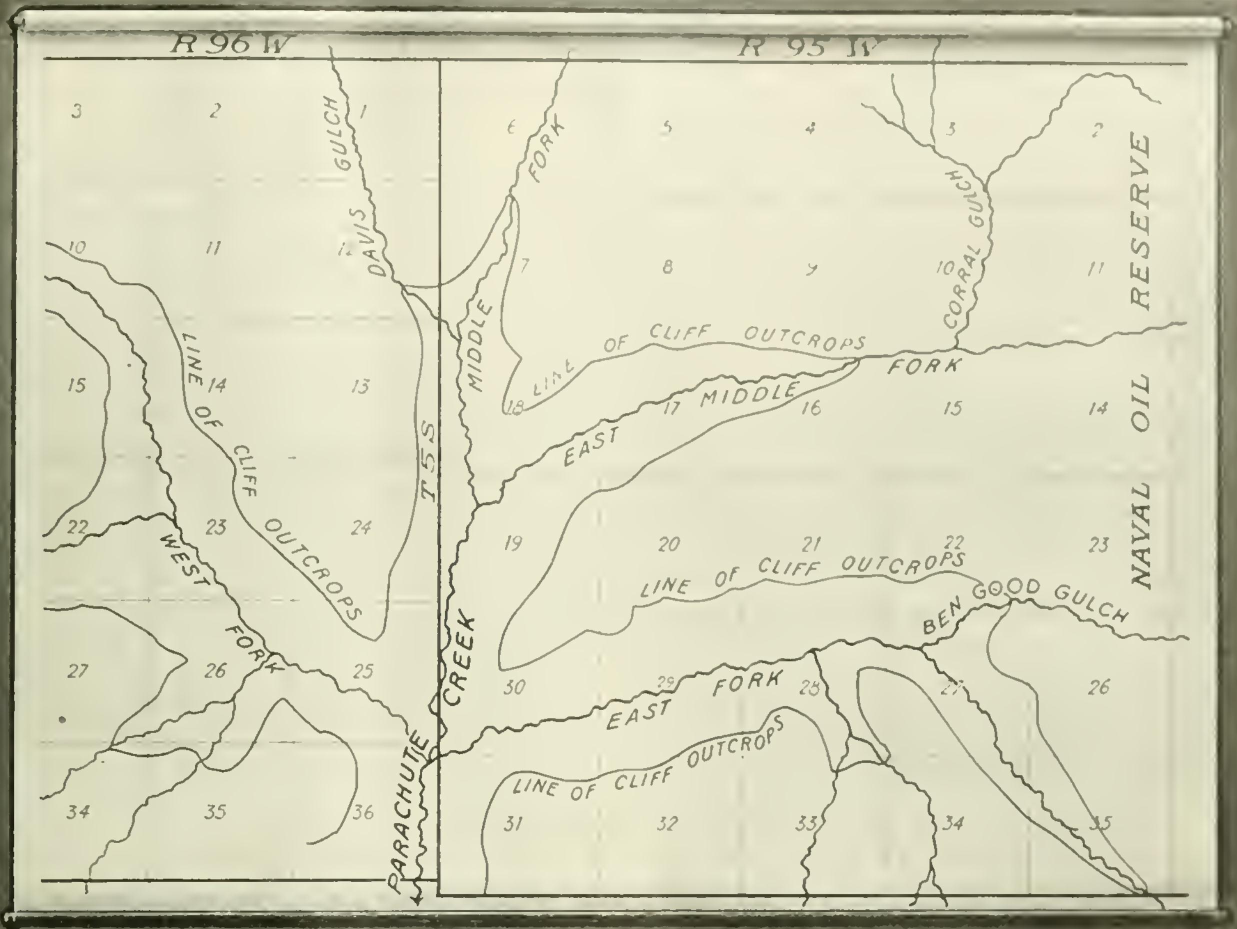
No. 3. This shows the banding of the horizontal beds of poor and rich shale. The rich shale forms the darker bands and resists weathering longer. The lower part of the formation is interbedded with considerable amounts of sandstone and is not workable.

No. 4. The talus-slopes represent a vertical height of about 800 ft. and the cliffs 500 ft. Heavy pine-timber can be seen growing on the shady slope. The workable bed of oil-shale, from 8 to 30 ft. thick, occurs near the bottom of these cliffs. Some narrow beds run as high as 90 gallons to the ton of shale.

No. 5. Showing the rough character of the tops of the mesas. This forms grazing land for thousands of cattle.

All of the shale carries some oil, the range being from 10 to 90 gallons per ton of shale. The richer shale is dark-brown to black on a freshly broken surface, the very rich shale having a glossy satiny lustre and a curling banding, somewhat resembling the banding of gneiss. This rich shale is exceedingly light in weight, some running 20 cu. ft. to the ton. The richer the shale the lighter the weight. It is very tough, a hammer bouncing back from it is though from rubber. A freshly broken piece gives off a peculiar petroleum-like odor. Some of the rich shale can be lighted with a match and makes a very hot fire. The beds vary from massive to 'paper' shale, showing the structure implied. In one district a paper shale will form the rich beds, in another the massive.

The mining will be underground, following a horizontal bed from 8 to 20 ft. thick, and will probably closely follow the methods used in the lead districts of Missouri. The shale is exceedingly tough and rubbery and should form a good roof.



AN OIL-SHALE DISTRICT IN COLORADO

Americanization*

By FRANKLIN K. LANE, Secretary of the Interior

INTRODUCTION. America threw the world into a daring maze of possibilities by its entrance into this war upon lines more idealistic than any other national venture in history. And in doing this we challenged the world to a contest for supremacy, not upon the field of battle but in the much larger field of intellectual, moral, and social leadership. Whether we can make good before the world depends upon our willingness and our ability to see the problems that we must meet and our will to meet them forehandedly. For clearly our right to world leadership in the new day is not to be measured by the number of men who have gone to France or the things they have done, but by the use we now and from this time forward make of the freedom we have secured for ourselves and others.

The world has taken us at our word. We said that the institutions which we enjoyed were those which the world should enjoy, for they were based upon rights inherent in man. We announced ourselves as coming to the rescue of imperiled democracies, and as the War progressed we came to the point where we would discuss peace only with those whose government, like our own, came from the people. Beaten upon land and frustrated upon sea, those sole surviving autocracies with which we fought broke into fragments before the mandate of an idea, and the map of Europe changed more in a few days than it had changed in centuries. The aggregating process which had gone on throughout many hundreds of years, and which had been deemed essential to national self-protection, was not only stayed but set at naught, and nations fell into pieces like a child's picture-puzzle, to be replaced in the general picture along lines of racial desire and a common culture. This is an unprecedented thing in history. Enemy nations came to an 'about face', professing themselves converts to the new faith, willing pupils in a new school. Thus out of an international struggle which we entered upon unwillingly we find ourselves emerging with a greater burden of national responsibility and a larger sense of the meaning of America—America as a leader in a world of democracies, if not a world democracy.

NEW RESPONSIBILITIES. What change in national policies is involved in this world-change? Who are these re-born racial groups who now come forward to their places at the family table? What is our duty toward them and upon what are they to live? What economic independence is essential to national existence? To what extent are we trustees for other peoples? What national purposes have we that should be made secure by international pact or union? Such questions go deep into problems to which even the ripest statesmen have in the past given little thought. And how much less the great body of the people! Yet now it is the duty of the American citizen to know of these things; to talk of them, as a process of whipping his own chaotic notions into shape; to project himself into a world where all horizons are new. While yet we may hardly be said to have learned to think nationally, we are compelled to give serious concern to the affairs of people of whom we had not heard four years ago. Most removed and isolated of all nations, living on and to ourselves, America has overnight moved into the centre of the world's stage and become subject to every scrutinizing and critical eye. This is a test for all that we have dignity and wisdom.

A wholesale challenge has been given as a result of our own idealism—how now may we meet it? Clearly we must set about making ourselves adequate to think in the larger terms of this greater life. Yet we must hold fast to that which makes possible any such broad conception—the ability of men and women to live together under the proved form of our own Government. To think in terms of many democracies or of mankind, we must work in terms of America. For all thought of making good in a greater sphere must be checked, qualified, and limited by our capacity to prove ourselves first of all strong and capable and purposeful at home. Our international value depends upon our strength, unity, and vision. And this in turn must in a democracy rest upon the intelligence, the capabilities, and the character of the individuals who make the Nation.

Now, the question that we must put to ourselves is: Are we doing all that can be done to develop these?

Our war experience has taught us, among many things, the value of a strong national spirit, the vital importance of national ideals, the impotence of ignorance, the dependence of this modern world upon skilled men and organizing ability, the need for and the possibilities that lie in the extension of co-operative effort of all kinds. Are we making full use of the facilities that we have for the promotion of these ends? Are we making out of America as a growing crop all that might reasonably be expected or that is demanded by our position in the world?

AMERICA IN 1918. The vitality of this question was put strongly to the Nation during the past year in a form that was not altogether agreeable. For the draft revealed the astonishing percentage of those in this country who were unable to speak our language or to read or write any language. Yet, I take it, there is no one thing so supremely essential in a government such as ours, where decisions of such importance must be made by public opinion, as that every man and woman and child shall know one tongue—that each may speak to every other and that all shall be informed.

---

*Excerpt from the Annual Report of the Secretary of the Interior.

There can be neither national unity in ideals or in purpose unless there is some common method of communication through which may be conveyed the thought of the Nation. All Americans must be taught to read and write and *think* in one language; this is a primary condition to that growth which all nations expect of us and which we demand of ourselves.

What should be said of a world-leading democracy wherein 10% of the adult population cannot read the laws which they are presumed to know?

What should be said of a democracy which sends an army to preach democracy wherein there was drafted out of the first 2,000,000 men a total of 200,000 men who could not read their orders or understand them when delivered, or read the letters sent them from home?

What should be said of a democracy which calls upon its citizens to consider the wisdom of forming a league of nations, of passing judgment upon a code which will insure the freedom of the seas, or of sacrificing the daily stint of wheat or meat for the benefit of the Rumanians or the Jugo-Slavs when 18% of the coming citizens of that democracy do not go to school?

What should be said of a democracy in which one of its sovereign States expends a grand total of $6 per year per child for sustaining its public-school system?

What should be said of a democracy which is challenged by the world to prove the superiority of its system of government over those discarded, and yet is compelled to reach many millions of its people through papers printed in some foreign language?

What should be said of a democracy which expends in a year twice as much for chewing-gum as for school-books, more for automobiles than for all primary and secondary education, and in which the average teacher's salary is less than that of the average day laborer?

What should be said of a democracy which permits tens of thousands of its native-born children to be taught American history in a foreign language—the Declaration of Independence and Lincoln's Gettysburg speech in German and other tongues?

What should be said of a democracy which permits men and women to work in masses where they seldom or never hear a word of English spoken?

Yet, this is all true of the United States of America in this year of grace 1918, wherein was fought the second Battle of the Marne and the Battle of the Argonne Forest.

These figures and facts look discouraging. They seem to present a picture that bodes ill for the Republic. But in reality they present an outlook that is far from disturbing, and that is the one cheering thing about such a Government as ours, wherein we can do as we will. And our will to do is never wanting when we see clearly the difficulty and know the way out. Already there have been devised methods by which these conditions may be remedied in large part, and these methods have been worked out practically by experiment and in no little detail.

A National Concern. If once we realize that education is not solely a State matter but a national concern, the way is open. And what argument that could be advanced would be more persuasive that education deserves and must have the consideration of the central Government than the figures that are given?

If men cannot be converted readily into soldiers, but must be held in camp while they receive a primary education, surely no one can hold that this is a matter deserving of merely State attention. The Nation's life may not have been imperiled by the presence in the Army of a considerable percentage of men who could not be equipped for service promptly, but this is the minor part of the reason why this humiliating condition should not obtain in this country. The greater reason is that we cannot govern ourselves while in ignorance. We cannot have a small portion of our population unable to sense the movement of our times save through the gossip of the corner and altogether unable to check the idle rumor and the slogans of demagogues, without putting at hazard the success of our system of government. And if we lag others will lead. The American must be the exemplar of democracy.

We are training boys and men to be farmers out of Federal funds, preparing to advance vocational education on a large scale, promoting the construction of solid highways within the States as part of an inter-state system, subjecting the packer, the canner, and the banker to Federal supervision; surely without violation of our fundamental law we can find a way by which the Nation can know that all of its people are able to talk and read our own language. I do not suggest Federal control, but I would strongly urge Federal co-operation with the States toward definite ends.

A little money, the co-operation of the States, and of the industries of the country—and both can be had—a little money, perhaps as much in a year as we have gloriously spent in five hours in France, and the work could be done. It could be done without coercion, without trenching on the prerogatives of the State in the slightest. If we could offer help to those willing to accept it, the end would be accomplished. Make the same kind of an offer to the States for the education of their illiterates that we make to them for the construction of roads, and in five years there would be few, if any, who could not read and write in this country. It may be worth while to consider some of the groups that, taken together, constitute the problem.

Native-Born Whites. Adult illiteracy in the less developed sections of our country is not a proud matter of which to talk, but it is present. Men who speak in the language of Shakespeare—and this is literally true, for their ancestors came here in his time bringing the language of Shakespeare and the King James version of the Bible on their tongues—tens of thousands of these men and women are today, after three centuries in this country, unable to read one line of Shakespeare or to sign their names. And yet they have fought for this country through every war and have died as heroes for a land that did not concern itself enough about them to see that they were educated. These people have not had their chance. Their condition is a reproach to a republic. And it is not that they are unwilling to take instruction, or that they feel superior to it. For the experiment has been made; and, day after day, old gray-bearded men and eager-eyed women went to the mountain schools when given the opportunity, and their letters tell of the delight that is theirs because the world has been opened to them.

And the children of these American-born people of Anglo-Saxon stock—what of them? Are they to be left to burrow their way through the darkness—one out of a thousand, perhaps, emerging to the opportunities of a railroad brakeman or a skilled mechanic after a splendid struggle against the handicap of early ignorance? These boys are expected to vote, and to vote wisely for those who shape not only the destinies of their own land, but, as we now see, for those who are to mold the lives of many peoples. Are they to vote without knowing that such new nations exist—without the ability to read the names on a map or the text of a treaty? This would seem to be challenging too strongly the protecting hand of a patient Providence.

THE NEGRO. Then, we must consider the negro. For him and his condition we are responsible as for no one else. He came here without exercising his own will. He was made a citizen without discrimination and in a large out-of-hand way. The Indian we feel we are responsible for as a Nation, and we give him an education—a most practical one. But the negro, who is a charge upon the American conscience and whose education, I believe, should long ago, in some part, at least, have been a charge upon the American pocket, is slowly, very slowly, coming into that knowledge which is his one chance of developing into a growing national asset—the knowledge of the way of making a living. When one looks into the effort that is being made to give the negro the right sort of an education, he finds a much more cheerful picture than he had thought. The Southern States, for instance, are meeting with no little eagerness the offers that come to them to give some direction to the education of the negro. The problem is basically one of money. The way has been found to give our colored citizen an education that will strengthen his fibre, widen his vision, and at the same time make him happy in achieving a useful place in society. There are no more inspiring and promising reports written in this country than those of the various foundations which are promoting the right method of educating the negro. Not only is the response from the States encouraging, but experience has gone far enough forward by this time to demonstrate that with guidance, oversight, and the bearing of only a part of the financial burden, this whole problem of lifting a backward people onto a level more compatible with our hopes for them and with their status as citizens can be realized. Still, this Nation may learn what education will do for an undeveloped race by the study of its own work in the far-off Philippine Islands.

THE FOREIGN-BORN. The next grand division of those who need education, inspiration, and outlook, and for whom we are responsible, is the foreign-born. Our responsibility arises out of our generosity. These sons and daughters of all the world have been drawn here by the generosity of our laws; the open hand has been extended across the seas. We have said to them that coming clean they would be welcome. This was the land of their heart's desire, where men could be their own masters and rise according to the quality that they had. Here was youth with which they could identify themselves, land which they could own, society of which they could become an integral part, political life which they could help to shape and in which they would have satisfied that world-long yearning for recognition. The man could here be developed, the full man, for schools were here and a sympathetic environment; others were climbing, too, with whom they could measure their progress. This was a fair picture surely. And they came, some for economic reasons, desiring their chance at the good things spread on this rich table that Columbus found. Others came that they might have the larger satisfaction of an independent, unhampered, unmastered growth as men among equals. They came in no apologetic humor, for they brought something from the older lands which they felt would be a contribution to a new civilization—their art, literature, their far-reaching historical perspective, their fervor for the opportunity to experiment, to adventure, to give a cast to this new world's life.

Here was an opportunity. We met them at the gate with a truly American welcome, which most of them could not understand: "Enter and make a place for yourself." This had been the greeting we ourselves had received. There was to be coddling here. This was a man's land, a place of test. The art that was most needed was the art of getting on. If literature and science and experiment were to come they must be founded upon the solid rock of a self-sustained, unpatronized people. Dreams of ease and long debate must be cast aside until the right to dream was earned. The American was to be a journeyman, doing his bit at the making of the land. If this was not a worth-while job, then there was no place for the stranger. We had mines to dig, wells to drill, buildings to erect, railroads to construct, farms to plow, sewers to lay, machines to build, and when one had done his share of these there might come the singing. The Lord had laid on us the responsibility of reclaiming for mankind a large slice of this lost land, and all else could wait in life till this end was reached. In this steady drive we made ourselves. We were impatient with those who called out to stop or go slow. The pace that we set was that which must be kept. "All men are born free and equal," we called to the newcomer, and went on, forgetful that he was not free, for he had still the limitations of his old life, nor equal, for many reasons. Manifestly a man without tools is not the equal of the man with, and those here already were men who knew the language of the new land, who knew its spirit and the way to meet it and run with it, who had access to the heart of a people and knew what its call was. Things did not lie obvious before the eye like a seam of coal on a naked hillside. This new land was a hunting ground, and those who knew the favorite cover and could blend most quietly into the landscape found themselves best at the game.

THE NEWCOMER'S DILEMMA. So this is America! A scramble for a living! Much to see, but no one to interpret it all. So thought this new American. Then the padrone came forward as a savior. Life was not to go out anyway. And, with others in like situation, possibly from his own country, equally ignorant, equally handicapped, the new American starts his life. It takes a brave and a very ambitious man to lift himself out of such an environment. Easily he becomes a victim to the shrewd, predatory padrone or boss. He falls into debt and becomes mortgaged to ignorance and squalor for years. His ideal of America has suffered a change. "And is this freedom?" he says to himself, as with tired back he bends to his work, without hope that the burden will be lighter tomorrow. He cannot read the signs which warn him of danger. He cannot read of the opportunities which city and country offer. In his own land perhaps he had no chance to learn in his own tongue. In this new land he is too tired, too hesitant to learn this strange difficult tongue. Is it any wonder if to this dissatisfied stranger the voice of one who speaks to him in the language of home has authority and carries far? And if this voice preaches discontent, and violent discontent, as the one sure path to better days, is it strange that he should listen? Who are the men who master this new world? Plainly the ones he knows, from whom he has suffered. Do these same men control everything; are there no sweet places of refuge? He can find no one to make him see the greater America. The whole of this continent is to him the cramped apartment, the dirty street, and the sweatshop or the factory. To the sweep of the great land and its many beckonings his eyes are closed. And in his isolation and ignorance and disappointment there is fruitful nesting place for all the hurtful microbes that attack society.

REASONS FOR AMERICANIZATION. This man is our charge. He needs and deserves care, solicitude, thoughtful consideration. Ignobly put—it will pay. More manfully said—it is our duty. Worthily—it is our opportunity.

Economically that man is a potential asset which we should not waste. Give him a glimpse into the philosophy which underlies our struggle and he will turn into a cheerful, strong fellow worker in the making of America, as have all the rest who have preceded him. It is money in our pockets that he should be able to care for himself; that he should know our language; that his body shall be well nourished and his mind hopeful. So much for the purely selfish side.

As to our duty, it grows out of our loyalty to ourselves, *noblesse oblige*. But we may look beyond these and find a finer reason for doing all in our power to reveal America to this man. He is a human being whom we can help to a truer view of that which we have said before the world was the most stimulating, invigorating, developing of all atmospheres that of freedom. And the test of our democracy is in our ability to absorb that man and incorporate him into the body of our life as an American. He will learn to play the game, to stand to the challenge that makes Americans; the unfostered self-sufficiency of the man who knows his way and has learned it by fighting for it will yet be his. And we will learn from him the viewpoint of those peoples who now are wrestling with all their new found strength and weakness to realize long-nurtured hopes. If we are to deal wisely in this larger day we must get within that man and look out with his eyes not only upon this country but upon the land from which he came, for has not America become as a foster mother to these strugglers?

METHODS. First of all, the hand of friendship for that new American, the voice of a friend who shall be an unselfish adviser, a guide in this strange land of troubles, small and large, but equally incomprehensible. Then the school, the night school, or if not that, the shop school. And with these the community centre, the gathering place that represents all America.

This is a program that has been well thought out. It has been tried out in a small way and found successful. It needs but nurturing to develop into a plan that will make the word 'Americanization' one of exceptional pride. For this plan the great cities of the country, where mostly our foreign born have congregated, are ready. For it the industries, the business men, are ready. I am warranted in the statement that all the largest industries in the land will from their own time offer an opportunity for an elementary education to every foreign-born man or woman in their employ. Some are willing to furnish the teacher if one competent for this class of work can be found. If the Government will shape the policy and undertake to make the propaganda for this definite end of giving a first insight into American words, newspapers, politics, life, that which has been regarded as the work of generations can be started in a very short time and men put on their way toward real citizenship.

I am not urging the absurdity that men can be transformed into Americans by a course in school. This is but a beginning. Knowledge of our language is but a tool. America is the expression of a spirit, an attitude toward men and material things, an outlook, and a faith. Our strange and successful experiment in the art of making a new people is the result of contact, not of caste, of living together, working together for a living, each one interpreting for himself and for his neighbors his conception of what kind of social being man should be, what his sympathies, standards, and ambitions should be. Now, this cannot be taught out of a book. It is a matter of touch, of feeling, like the growth of friendship. Each man is approachable in a different way, appealed to by very contradictory things. One man reaches America through a baseball game, another through a church, a saloon, a political meeting, a woman, a labor union, a picture gallery, or something new to eat. The difficulty is in finding the meeting place where there is no fear, no favor, no ulterior motives, and, above all, no soul-insulting patronage of poor by rich, of black by white, of younger by elder, of foreign born by native born, of the unco' bad by the unco' good. To meet this need the schoolhouse has been turned into a community centre. It is a common property, or should be. All feel entitled to its use. When we were younger this kind of machinery was not necessary, for we were fewer in number, lived in smaller communities, and felt a common interdependence which made each one a trumpet blowing herald of democracy. Today, however, there must be some thought given and some money expended in even having an opportunity to touch the hand of a fellow man.

I believe that more and more thought will be given to our school system as the most serviceable instrumentality we possess for the development of a better America. It has been, we must confess, a very much taken-for-granted institution. It is probably of all our inventions the one of which we are most proud, and like other of our inventions we have not realized the greatness of its possibilities. We have become accustomed to hearing it spoken of as the heart of the Nation. But this figure must be taken with very definite limitations. It is the beginning of things for the boys and girls, but to the man and the woman it is almost a thing outside of life. This should not be so, for it may be the very centre of the social, the intellectual, and in smaller places of the economic life. This is so, in fact, in Switzerland and in Denmark, and is becoming so in many places in our country.

To the necessity for more thorough education of the people all countries have become keenly alive. One large part of England's grand plan of reconstruction is the founding and conducting of a great national school system out of which will come more men and women of trained minds and trained hands.

As we move further and further from the War we will discover much that we do not now see. But this one thing stands out more plainly than ever before, that this world is to belong to the workers, those who do and those who direct the doing. Not merely to those who drive the nail or lay the brick, but also to those who have come to a higher capacity through education and larger experience, the men of scientific knowledge, of skill in the arts, of large organizing capacity. Ease, sheltered repose, will come only to those who themselves have earned it. This is the inevitable tendency of democracy.

This thought is not new to America, it is American, for here we have climbed the rough road of experience together, each jostling the other and pushing the weak ones aside. To the swift and to the strong there will always come the premiums, but to the cunning and to the greedy there will be given less and less opportunity.

The test is to be in peace as it was in the time of war. Are you fitted for the fight? The man who knew how knowledge could be converted into power was the man for whom there was unlimited call. So it is increasingly to be. To be useful is to be the test that society will put. Each man's rights are to be measured not by what he has but by what he does with what he has. The honors—the *croix de paix*—the richest rewards will go to the capables, those who are not standardized into 'men-machines', those who dare to venture and learn to lead. But all must work, and this duty to work and respect for work should be the earliest lesson learned. And it should be taught in the school, not as a homily but in a living way, by tieing work with instruction, making the thing learned to apply to something done. I should like to see the day when every child learned a trade while at school, trained his mind and his hand together, lifted labor into art by the application of thought.

To be useful is the essence of Americanism, and against the undeveloped resources, whether if be land or man, the spirit of this country makes protest.

An Annealing Furnace for Crucibles

The ideal annealing-furnace consists of two chambers, the size depending upon the number of crucibles used. A firm that buys crucibles by the car-load has built a modern annealing-plant. It consists of two rooms side by side, each large enough to contain a carload of crucibles. The heating in this case is done by steam-pipes around the walls, sufficient to raise the temperature in the room gradually to 300°. When a new lot of crucibles is received they are put in one of these rooms. The heat is turned on and gradually raised until at the end of a week or 10 days it has reached the 300° point and eliminated all the moisture from the crucibles. They are kept in this atmosphere until they are all used. In the meantime, when another lot of crucibles comes in, they are put in the second room—the reason for this being that if they were to put the fresh lot in with some of the seasoned ones, the moisture in the new ones would counteract all the good effect that the previous heat had done.

After it is taken into consideration that a crucible which comes out of the Dixon kilns contains as little as 0.25% moisture, as soon as it cools and comes in contact with the atmosphere it is liable to gather as much as 6%. This would mean that in a crucible weighing 100 lb. there would be nearly one gallon of water absorbed, so if this 'green' crucible is placed in an oven where the dry ones are, the result can readily be seen.

Furthermore, it is necessary that some ventilation be arranged in an annealing-oven of this kind. One opening at the top on one side of the oven and another at the bottom in the opposite side allows for the circulation of air necessary to carry the moisture away. What has been said in regard to a plant to take care of a carload of crucibles is equally true in regard to a smaller quantity. The principle involved is the same, and the increased life of crucibles will certainly pay the expense involved in erecting this kind of a plant. A. C. Sorenson in 'Graphite,' December 1918.

Concentration of Lead-Zinc-Silver Ore at the Zinc Corporation's Mine

By GEORGE C. KLUG

*The methods employed in the Broken Hill practice of concentration apply the principle of gravity concentration by jigging and tabling for the production of a high-grade lead concentrate; a zincy tailing is also produced, and this is either treated direct by flotation for the separation of a mixed lead and zinc concentrate that is afterward separated into a high-grade zinc concentrate and a leady concentrate by ordinary tabling methods, or the tailing is treated by preferential flotation methods for the separation of galena and blende to produce lead and zinc concentrates respectively. The flotation methods employed are those of Minerals Separation, De Bavay, and Delprat.

The slime produced in the crushing and grinding of the ore is treated by preferential or selective flotation, whereby the galena and blende contents are separated into lead and zinc concentrates. In this section of the work are employed the processes of Lyster, Owen, Bradford, and Seale-Shellshear.

A recent innovation has been the introduction of the Seale-Shellshear method of cascading as modified by Lyster and Hebbard for the purpose of selectively separating the galena from the mill-pulp. The tailing from this de-leading process is further treated by cascading in an acid circuit for the separation of the blende as a zinc concentrate. This system of cascading has been further improved upon by the Wallaroo company in connection with the flotation of copper ores. The latter modification is now being tested by the Sulphide Corporation, which company has in its milling practice already displaced a large number of Wilfley tables by cascade flotation. While this cascading method is certainly attractive and undoubtedly effects a saving in power, it is a debatable point whether it offers a more profitable scheme than that of tabling followed by a selective process such as the Lyster. For a company designing a new mill, it would be well to test both systems experimentally before deciding the point.

Where the ore is of a calcitic nature, the elimination of the acid-consuming mineral, calcite, by gravity methods producing a tailing of low metal content and a zinc middling containing about 16% zinc, is a more profitable practice than treating the whole of the tailing by flotation methods such as can be successfully carried out on an ore having a silicious or rhodonitic gangue.

The concentration practice adopted by the Zinc Corporation at the South Blocks mine is typical of that which obtains when dealing with an ore containing an appreciable amount of calcite, and this is described by the following notes and accompany flow sheet.

The treatment aims at separating the ore into the following products:

1. Lead concentrate assaying 66% lead, by jigging and tabling.
2. The elimination of as much of the calcitic gangue as possible in the form of a sand, which assays 5% zinc, 0.6 oz. silver, and 1.6% lead, and which is used for filling underground.
3. Collection of all the slime for preferential flotation treatment in the slime unit.
4. The balance forms a zinc middling, which is treated at the zinc concentrator.

The lead mill, which has a capacity of 26 tons of crude ore per hour, is situated on the south side of the main hauling-shaft. The ore is raised from underground in self-dumping skips, with a capacity of 2.5 tons, and is automatically tipped into the breaker-bin, the capacity of which is 200 tons, of which 150 tons is live. The rough ore (up to 10 in. maximum dimension) is fed from the bin on to a 36-in. belt-conveyor, traveling at 50 ft per minute, and any large pieces of waste are picked off this belt by hand. This conveyor delivers the ore to a Bigelow jaw-breaker, 12 by 30 in., running at 215 r.p.m. set to break at 4-in. gauge. The ore from this breaker is conveyed by a short 18-in. belt to a bar-grizzly 6 ft. long with 1½-in. openings, the oversize falling into the No. 2 breaker and the undersize joining the product from the No. 2 breaker. This breaker, of similar size as the previous one, is set to break to 2-in. gauge. The broken ore is conveyed by 18-in. belt-conveyors over a Blake-Denison continuous weigher, and is delivered either to the mill bin or the crude-ore storage-bin. The former bin has a capacity of 300 tons, and the latter 1200 tons. The crude-ore storage-bin has a chinaman chute running longitudinally along its bottom, and the ore, when required, is delivered to the mill-bin by an 18-in. conveyor under the chinaman.

The average sizing of the ore at this point is:

	%
On 1 in. square aperture....	51.1
On 7/16 in. square aperture...... ..	21.7
On 7/32 in. square aperture..............	7.9
On 3 mm. round aperture................	3.8
Through 3 mm. round aperture..........	15.5

From the mill-bin the ore is fed by means of two shaking screens. These screens are 7 ft. 9 in. long by 2 ft wide, 1¼ in. stroke, run at 240 strokes per minute, and fitted with punched-screen plates with 3-mm. holes. The

---

*From 'The Mining Magazine', of November, 1918.

oversize from these screens passes to two sets of Cornish rolls 32 by 18 in., running at 20 r.p.m., the undersize going to No. 2 elevator and thence to the jig-screens. The crushed ore from each set of rolls goes to a bucket-elevator (12 in. by 8-ply rubber belt, traveling at 320 ft. per minute) and portion of it is delivered to the Raff screens, the balance going to the shaking screen feeding the rolls. The Raff screens are of the ordinary revolving type, clothed with 7 by 7 by 18 gauge wooven steel wire, running at 11 r.p.m. The oversize is returned to the rolls, and the undersize is elevated to the jig-screens. There are four of these, clothed with 25 by 25 by 25 gauge woven brass wire. The oversize goes to the jigs, of which there are two, and the undersize, which contains about 19% lead, after it is thickened, is fed to the north row of primary Wilfley tables.

The jigs are of the May type, with only three hutches, using punched-plate screens of 4 mm. diam. and 3½ mm. diam. holes on No. 1 and 2 hutches, respectively. The concentrate from the two hutches averages about 66% lead, and the tailing 6% lead. The latter product is elevated and laundered to seven revolving screens, clothed with 20-mesh Tyler brass ton-cap screening, the undersize from which forms the feed for the south row of primary Wilfley tables. The oversize from these screens is distributed between twelve 5-ft. grinding-pans, fitted for a central feed and negative discharge. The jig-tailing amounts to about 1.25 tons per pan per hour, and the returned oversize from the pan-discharge brings the total feed per pan to about 3 tons per hour. This type of pan produces a minimum amount of slime, and, before the introduction of flotation methods, when the mineral in the slime was practically unrecoverable, had much to recommend it. In view, however, of recent developments in selective flotation, the slime is no longer a bugbear, and any new installation would probably embody tube-mills for secondary grinding. The discharge from the pans joins the jig-tailing, and the oversized material is returned again to the pans.

The primary tables are arranged in two rows of 8 tables each. The northern row treats the undersize from the jig-screens, and the other row treats the re-ground jig-tailing. The feed for each row is thickened in 8-ft. Callow settlers, the slime-overflow from which is sent to the Dorr thickeners. These tables (No. 5 Wilfley, run at 280 r.p.m.) make three products:

1. Finished lead concentrate assaying 68% lead, which joins the concentrate from the jigs, and is laundered to No. 8 elevator which delivers to the concentrate-collecting vats, four in number, each having a capacity of 300 tons, and each fitted with filter-bottoms. The concentrate is distributed in the vat by means of a Butters distributer, which is mounted on a trolley and serves each vat as required. The overflow from these vats goes to the Dorr thickeners. The concentrate, after being drained by means of a vacuum-pump, whereby the moisture is reduced to about 4%, is loaded, through bottom-discharge doors, into trucks for dispatch to the smelters.

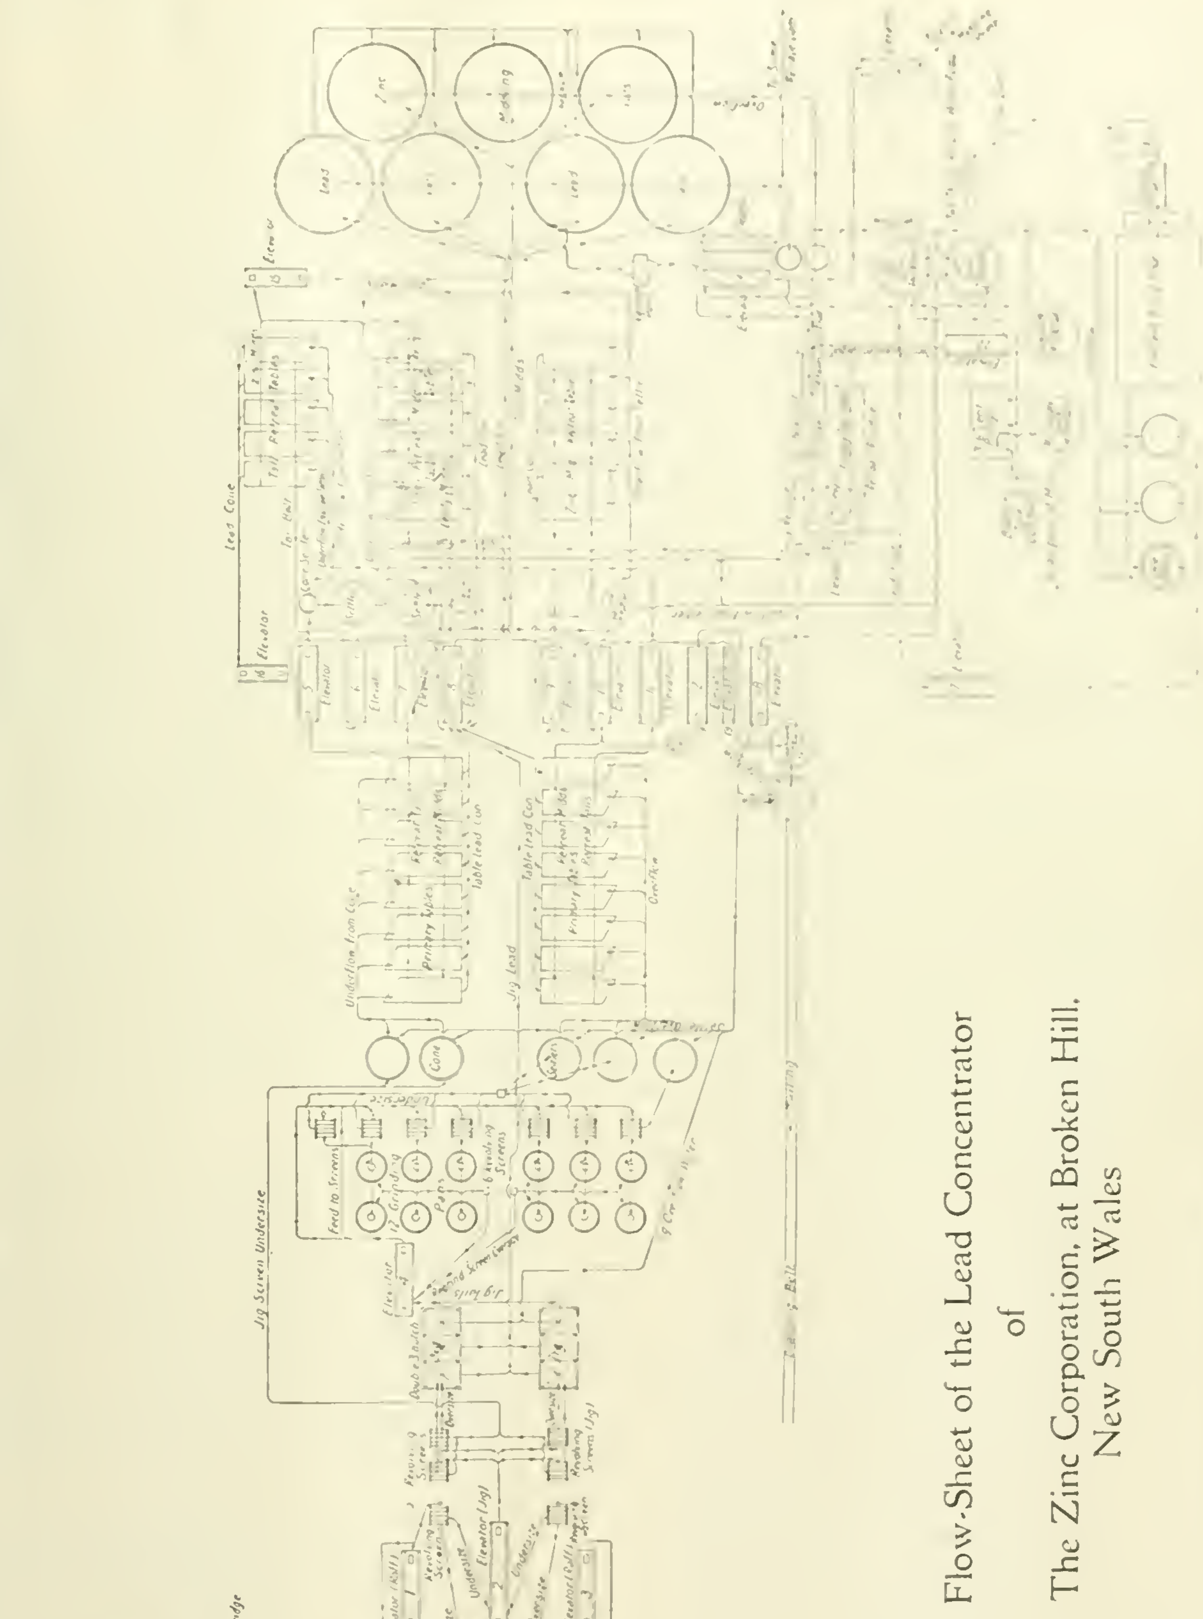
2. A middling, which is elevated, and after being thickened, is sent to eight secondary Wilfley tables for re-treatment. These tables reduce the lead content to 2 to 3%, and the residual zinc middling, now assaying 15.5% zinc and 4.2% lead, and representing 28% by weight of the crude ore, is elevated, collected, and drained in steel vats. This product is sent to the zinc concentrator for recovery of metals in the form of zinc and lead concentrates. Experiments have demonstrated that this material is amenable to preferential galena flotation, followed by Bradford's copper-sulphate method for flotation of the blende in an alkaline circuit, and this process will ultimately replace the ordinary flotation-acid method.

3. Tailing. This is elevated and separated by cones into (a) coarse sand, (b) fine sand, (c) slime. (a) and (b) are re-treated on five and three tables respectively, whereby small quantities of lead concentrate and zinc middling are recovered, and a residue sand produced assaying 0.6 oz. silver, 5% zinc, and 1.6% lead. The last mentioned product, representing 40% by weight of the crude ore, is dewatered on a draining-belt, and conveyed to the residue dump. The slime is sent to the Dorr thickeners.

All overflows from cone thickeners, etc., are fed to two Dorr thickeners (25 ft. diam. and 30 ft. diam. respectively). The clear water from these flows to a sump and balance tanks having a capacity of 25,000 gallons. From these tanks the water is elevated 40 ft. to the head service tank (14,000 gal.) by three 6-in. centrifugal pumps, one of which is kept as a stand-by. The slime from the Dorr thickeners is elevated and fed to the head of the 10-compartment lead-flotation unit, at a consistence of about 33% solid.

The flotation box, which is fitted with the vertical hollow spindles, is of the single-level type, each compartment being 24 in. square by 4 ft. deep. The impellers are of 10 in. diam. by 2 in. deep, shrouded on the upper surface, and are driven at 700 r.p.m. and set ¾ in. from the bottom of the box. The 10-compartment unit, including counter-shaft, requires 21 hp. Air is drawn in through the vertical hollow spindle, and the float overflows from the surface of the mixing-compartment. Cast-iron baffles are used in the lower 2 ft. of the boxes, and upper 18 in. is crowded toward the adjustable overflow-lip. A mixture of eucalyptus oil and tar oil, in equal parts (about 0.2 lb. per ton of slime) is added at the launder between the elevator and the head of the box. The lead concentrate passes to thickening-cones, and is periodically run into dams on the lead-drying floor.

The tailing from the lead-flotation unit is elevated and fed to a 14-compartment unit similar to the lead unit, except that phosphor-bronze impellers are used. About 0.6 lb. of copper sulphate per ton of slime is added to the pulp at the exit from the lead unit, and about 0.3 lb. of eucalyptus oil per ton of slime is added just before the pulp enters the flotation unit. This treatment, from 10 of the boxes, yields a float product assaying about 39% zinc, and a tailing assaying 2% zinc, 0.5 oz. silver, and 0.5% lead, which latter is sent to the residue-dam. The floated product is re-treated, without further reagents, in



Flow-Sheet of the Lead Concentrator
of
The Zinc Corporation, at Broken Hill,
New South Wales

the remaining four boxes, to remove a further quantity of gangue, and the resultant float assays 42 to 43% zinc.

This mill is effecting an average recovery of 85% lead and 68.2% silver, from an ore containing 14.3% lead, 2.6 oz. silver, and 9.2% zinc. A further recovery of 2% lead is made from the treatment of the zinc middling at the zinc concentrator. The percentage of zinc recovered in the form of zinc middling is 60%. This, on re-treatment, produces 50% zinc in the form of zinc concentrate.

The Lyster process is used for the preferential flotation of the galena from the blende and other minerals in the slime. This was the first preferential flotation process to be successfully applied to Broken Hill ores, and, although the machines used by other mines differ considerably, the process is still used more than any other for preferential flotation work on crude ore along the Broken Hill lode. The process depends on the presence of certain salts, notably calcium and magnesium sulphates, in the circuit-water, which act as a modifier on oil-frothing media. The water pumped from the underground workings contains a sufficient quantity of suitable salts, and the mill-circuit water is made up from this source. The addition of a soluble copper salt, according to the Bradford copper sulphate process, causes the blende to float, and advantage is taken of this to lift the blende after the slime has been de-leaded by the Lyster process. The above results are obtained in a neutral circuit, and the presence of the calcite, therefore, presents no difficulties.

Besides the Lyster, two other preferential flotation methods are being widely used at the present time. These are the Bradford hyposulphite or sulphurous acid, and the Seale-Shellshear processes. The Bradford hyposulphite process depends on the wetting of the blende in the presence of SO_2 liberated from $Na_2S_2O_3$ in a faintly acid circuit; this prevents the blende from floating, and, when the galena has been floated, the SO_2 is expelled by heat, air, or acid, and then the blende is lifted in the ordinary way. This method is especially applicable to dump-slime that has become partly oxidized, but, being an acid process, the cost of the reagent renders it too expensive for very calcitic material.

The Seale-Shellshear cascade system is, strictly speaking, only a system to reduce the power usually employed for agitation in flotation machines. The pulp flows from the bottom of each box to the one immediately below it, through an injector which draws in air, and the air mixing with the pulp causes the mineral to float in the lower box. When used for preferential galena flotation, such results are undoubtedly due to the Lyster conditions being present. The only power required for this system is that necessary to elevate the pulp to the first box. The method is applied to the de-leading of fine sandy material and, as previously stated, has taken the place of tables in one of the mills. Judging from observation, however, the tailing obtained by this method is not as clean as that from some of the other types of machines.

[Other articles on flotation practice at Broken Hill appeared in our issues of September 21 and 28, 1918.—EDITOR.]

Notes on Powdered Coal

By A. V. ADAMSON

*The experience of users of pulverized fuel in metallurgical work, particularly for open-hearth furnaces, has demonstrated that high ash and sulphur in the fuel are a detriment. The sulphur in the coal enters into the finished product, hence, in this class of work it is extremely important, when powdered coal is to be used, that it be selected with care, and only those having low percentages of sulphur be used in combination with proper means for combustion.

It has been found that no general rule can be laid down as to either fineness or dryness; for some uses a wide range is permissible in both factors, while some classes of fuel require different treatment than others.

Ash, slag, and clinker are a real problem; to prevent their formation on tubes, checker-work, and furnace-walls, is absolutely essential. Methods of combustion, and furnace design are of vital importance. Scientific analysis of the difference in heat transmission due to radiant fuel and ash in suspension has offered a real opportunity for research. None of these items can be disregarded; yet the beaten highway of cement practice has offered no answer because in long-flame rotary-kilns, such as are used in cement work, these questions are of no importance.

Four years' practical operating experience on locomotives, heating-furnaces, and boilers, have definitely settled the following factors:

1. Pulverized coal is not suitable for all purposes, and the character of the fuel available is one of the factors causing the necessity for separately considering each proposed installation.

2. Honeycomb and ash on tubes, and slag on walls and furnace-floor, can be controlled.

3. Flame velocity must be reduced to a minimum.

4. No continuous operating efficiency or continuous good results can be obtained with pressure for combustion, even if only ⅜-oz. pressure is used; and the more nearly a furnace approximates a balanced-draft condition, the better the operating results.

5. The incoming fuel must be mechanically mixed with the air-conveying medium to prevent a pulsating flame and the formation of coke due to lumps of pulverized coal in the feed.

6. In general, the future for the use of coal in pulverized form for steam generating, metallurgical, and chemical work, offers a real opportunity for fuel economy and increased production; it is the one way by which shortage of oil, gas, and coal, together with transportation and labor difficulties can be overcome. Due consideration, however, must be given to the difficulties inherent in and the troubles incident to improper design and erection. Each installation requires special development.

*Abstract of discussion of the paper of H. R. Collins, presented at the Colorado and Milwaukee meetings of the A. I. M. E., Sept. and Oct., 1918.

The Treatment of Influenza

By A PHYSICIAN

During and since the epidemic of 1889-'90 I have been a strong believer in active treatment against infective colds, influenza, and pneumonia. Practising in Rome, Italy, during that epidemic gave a good opportunity to discuss and compare methods of treatment with Italian, English, French, and German physicians. It was then generally conceded that those who treated influenza cases actively had fewer cases of pneumonia and in their cases of pneumonia had fewer fatalities. The salicylates when well borne and benzoate of soda in large doses otherwise was the favorite active treatment. Creosote was looked upon with favor in pneumonia. The symptomatic and sustaining remedies were, of course, used when indicated. Nitro-glycerine was held important. Dr. A. A. Smith of New York advocated nitro-glycerine to effect regardless of dosage in cyanosis. I believe he was sound in that, and many have forgotten it to their cost.

The various methods of treatment advocated I have studied with respectful interest, while looking for something immediately available for the general public. Having experimented with a chemical compound of lime and creosote, alleged to be non-poisonous, in various infectious diseases, and observed it to be effective against several toxic diseases, including ptomaine poisoning, I believed it to promise some usefulness against influenza. Being sensitive to this infection and believing that I would not survive another epidemic unless something was found effective as a cure and prophylactic, I used this aqueous solution of lime and creosote on myself rather recklessly. To my surprise I experienced no untoward results but was improved in several particulars. Premonitory symptoms of influenza were remarkably cleared up, such as coryza, muscular pains, general debility, and loss of appetite. My influenza patients began to make such good recoveries that I soon decided that this solution was acting as a true specific against the infection. After further convincing observations I decided that it was my duty to give the remedy to the public as widely as possible, especially to our Army and Navy. Subsequent observations have convinced me that the solution is also effective against the toxemia of pneumonia.

Here we have a colossal infection and the toxemia is what kills the patient. In the present epidemic the toxemia is variously manifested. Notably in both bronchial and lobar pneumonia, severe cyanosis, and oedema of the lungs. To meet the toxemia my dependence is upon the aqueous solution of lime and creosote. To relieve the cyanosis I depend upon adequate doses of nitro-glycerine given frequently enough for a sustained effect. I believe the charts of cases will adequately illustrate this treatment among physicians. I have repeatedly seen cyanosis clear up, and oedema of the lungs as well, under this treatment.

We first observe the blueness of the nails, then the gradual spread of this to the skin and lips, then the feeling in the patient of impending suffocation, the coarse bubbling rales of the chest, sometimes called the death rattle, then the gray pallor of death. Having repeatedly seen severe cyanosis and oedema of the lungs, with a sense of impending suffocation, yield to nitro-glycerine and the solution, I am bold enough to state as my belief that in Calcreose solution we have a remedy against even the toxemia of pneumonia.

I have with me the charts and histories of six cases of pneumonia, some of them having been examples of extreme cyanosis and even of commencing oedema of the lungs. In my practice I have had no death from pneumonia during this epidemic, though my cases range from four months to 75 years of age. Also I have had the pleasure of seeing several recoveries in desperate cases, seen in consultations.

Several cases of pneumonia have been without nursing or adequate care and have made good recoveries with the aid of the Calcreose solution and what little attention I could give at long intervals.

Now I beg your indulgence while I relate quite from memory a case that seems to me remarkable. A young lady of 28 called me on Saturday. I found her with pneumonia involving the lower lobe of the right lung and a temperature of 105°. The pulse was 138. As no nurse was obtainable, I was obliged to depend upon a married sister with no training. I was obliged to teach her the use of the thermometer. As the young woman had a loud obstructive mitral murmur from an attack of rheumatism some years previously, I was doubtful about the outcome. By Thursday morning things had progressed so favorably that I thought convalescence was near. The temperature had dropped to 99½° and resolution seemed begun. Thursday noon the temperature suddenly shot up to 105° and the patient became cyanotic with a sense of impending suffocation. The condition I found was sufficiently grave to dismay me. Fine cripitant rales at the base of the left lung and coarse bubbling rales over the whole upper chest were indicative of oedema. The patient declared she was dying, that the medicine had disagreed with her, and that she would take no more of it. She also declared that every time her heart beat it pulled her over. As the pulse was 160 that alone seemed serious. I persuaded her that the disease instead of the medicine was at fault, doubled the dose of Calcreose solution and administered 1/50 gr. of nitro-glycerine every hour for three doses. Then things were so far relieved that I left the nitro-glycerine to be administered by mouth at two-hour intervals, 1/100 grain.

At four-hour intervals I administered a pill containing 4 m. tr. digitalis 2 m. tr. stropanthus and 1/60 gr. strychnine. The patient took at this time four teaspoonfuls of Calcreose solution every two hours. She has made a good recovery, though she still has the mitral murmur.

The youngest case of broncho-pneumonia was four months of age. Her sister, four years of age, also had broncho-pneumonia and five other children had severe influenza. A young man 27 years old boarding in the family had pneumonia at the base of the right lung. All made good recoveries, though no care was available save that given by the mother of the family. The treatment was simple. For the most part consisting of milk, Calcreose solution, and clay poultices to the cases of pneumonia. The question was put to me recently, "Would you advocate the use of Calcreose solution by the general public as a prophylactic?" I replied, "Yes, let the public substitute it for aspirin, in my opinion a dangerous heart depressant far too prevalently used."

Two months ago, having sent this treatment to Cripple Creek and other mining centres in Colorado, the six physicians there have reported remarkable results in pneumonia cases even in those high altitudes. On the strength of this report I have recently been asked to send the treatment to the copper mines of the Anaconda company at Butte, Montana.

In closing a word about the scope of what may be reasonably expected of the solution. It does not immunize. It is rapidly excreted. It simply kills the germs and I believe also exerts a favorable action against the toxemia. Prolonged use does not seem at all injurious. It can be pushed to any necessary extent in an emergency. Its use in pneumonia requires the services of a skilled physician. However, the nature of the remedy is such that the public can scarcely abuse it.

When we have classified the various germs, including the local rascals that have joined the aliens, we can label them and possibly write an epitaph, after the manner of certain cowboys in a frontier town. There was a bad man called Jake Deadeye who had killed several men. Finally he killed some one under such circumstances as to send the sheriff and a posse after him. He declared he would not be taken alive. The sheriff and posse surrounded his hiding-place, and finally, to the dismay of the posse, they saw the sheriff deliberately approach Jake. Jake for a few moments was like a flaming torch with his 45, shooting from the hip. Then the sheriff calmly lifted his gun and shot once. Jake crumpled up and fell forward with a bullet between the eyes. The posse rushed up upbraiding the sheriff for his apparent callousness. "Pshaw! boys," said he, "I always figured none of them hip-shooters could hit a barn-door beyond 15 or 20 paces, so I waited at 50 paces and let him have it." Certain qualities of Jake seemed to impress his fellow-citizens, so they voted him a monument with an epitaph reading as follows: "Here lies the body of Jake Deadeye. He done his damndest. Angels could do no more."

The non-poisonous nature of Calcreose solution was demonstrated by an accident. An elderly woman with a severe attack of influenza took four ounces of the solution at one dose and undiluted. Her attendant was instructed to give her a glass of milk and during the remainder of the night to give fluids freely. No bad effect resulted from this large dose.

German Sabotage

A statement has just been issued by the Société des Hauts Fourneaux Forges et Aciéries de Denain et d'Anzin (Denain and Anzin Blast Furnaces Forges and Steel Foundries Company), in Northern France, as to the methods by which their vast establishments were destroyed by the Germans. The buildings, blast-furnaces, foundries, and work-shops of the company occupied an area three miles long by a mile and a half wide. The Germans having captured the district in September 1914 the works were closed down on September 15 owing to lack of labor and raw material. The general manager was asked several times by the Germans to re-start his works to meet German military requirements, they offering to provide labor and materials and also engineers if required. The manager, however, refused to work for the Germans, and the works were taken possession of at the end of 1914 by Captain Bocking, of the German 'Removals' Department. Captain Bocking, who is himself in civilian life an important German ironmaster, proceeded to make a complete inventory of the works. Numerous gangs of German workmen, helped by 3000 Russian prisoners of war, proceeded to remove the whole of the ore, castings, together with all intermediary and finished products, as well as machinery and plant. The main buildings were demolished under the guidance of a man named Dryer, a German subject, who had formerly been employed as chief foreman by the French Homécourt Foundries Company. By means of threats he succeeded in getting possession of 80 tons of bronze, of the cages of the flattening and rolling-mills, frames, and all other machinery not already removed. All these goods were dispatched to competitors in Germany, the names and addresses of which are in the hands of the representatitves of the plundered company who succeeded in retaining possession of the railway consignment notes. Finally, when everything removable had been taken away, the Demolition Department at Metz sent a squad of men who blew up with dynamite the offices and all other remaining buildings. Seven or eight sheds were, however, allowed to remain as storehouses for wood for the German armies. When the German retreat took place recently these storehouses, filled with wood, were fired so that they should not fall into the hands of the Allies. The entire establishment of the company, one of the largest in France, has thus been entirely destroyed, and it will require several years to reconstruct the works. —'Financial Times.'

REVIEW OF MINING

JOPLIN, MISSOURI

Review of the Zinc-Lead Region During 1918, and Present Conditions.

The month of December saw a radical readjustment set in for the ore markets of the Tri-State region. It was not unexpected in time, but the degree was not only not greater than expected, but was an astonishing one for an industry that has been producing on a losing basis for the last six months. The readjustment has been paralyzing in its intensity, and the industry shows signs of weakness among even its strongest units.

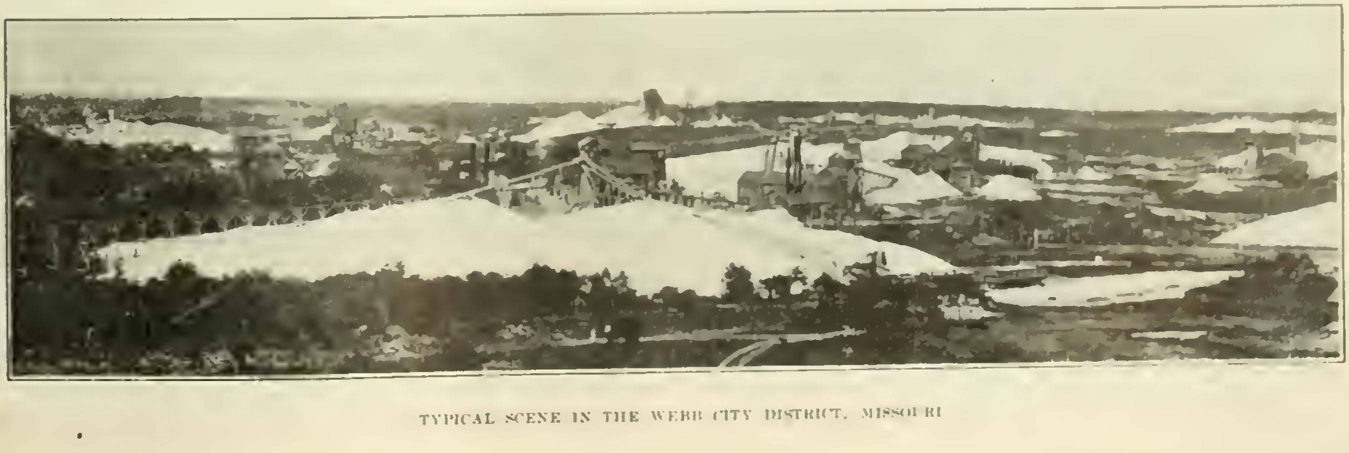
With the end of the War came an end of the agreement price for high-grade zinc concentrates, so that once more these are practically on the open market. They are still being allocated by a board, but on a much lower price. High-grade zinc concentrate is now selling freely at $45 to $55 per ton, while second grades are being bought readily at $40 to $45. Some undesirable product is as low as $37.50. The amount of high-grade material sold during December was small, so that the average for the period dropped perceptibly. The average for all grades of zinc-blende was $44.60, compared with $56.20 in the previous month. The quantity sold amounted to 26,300 tons, against 26,915 in November. This does not represent all the ores sold, as the buyers have a large tonnage in bins as yet unloaded. Surplus stocks of blende decreased to 25,000 tons during the month, compared with 27,270 at the end of November. This was due mainly to the greatly lowered production when the month saw a decreased market.

Calamine remained steadier and sold at $25 to $38 per ton. The average price for all grades of this class of ores was $33.86. The average shipment per week was 448 tons, while the average shipment of blende reached 6575 tons.

Lead fell at the beginning of December to $80 per ton, after holding steadily to the $100 mark for months. The closing month of the year saw still another radical reduction, reaching a minimum of $65, or a 35% decrease in 30 days. That this reduction hurt the industry became apparent immediately when mill after mill closed down during the holidays, and offered no hope of re-opening unless there was a cut in the cost of supplies and labor. There has been a small reduction in the price of powder and steel, but in no other supplies. This week sees the announcement of wage-scale revision downward. This cut in wages amounts to 50 cents on the day for day men, and 2 cents per can or 4 cents per ton for the piece-work men, who are the shovelers and who make the largest wage in the district. Often this class of laborer makes a larger weekly salary than the superintendent. The new wage-scale is to take effect beginning in the first week of 1919.

It is difficult to forecast the production for the next few weeks or months; that it will be lower is generally agreed. Producers are making every effort to adjust themselves to new conditions, but, even so, many mines cannot hope to operate during the reconstruction period if ever again. Labor is plentiful now; in fact there is a huge surplus arising from the returning soldiers and the number of men laid off from mines closed down or put on single shift or on minimum development. Prospecting by drilling is also generally at a standstill and little new work can be anticipated for a number of months. If the district maintains a semblance of its former activity it can produce 8000 tons easily, but where it will find a market for it remains to be shown. Surplus stocks have lowered to 25,000 tons, which is 2200 tons above the weekly average for the year. On the other hand, there is in this surplus stock a considerable tonnage of sold concentrate, which cannot be moved on account of the roads. Had this been shipped as it normally would have been with good weather, it is doubtful if the surplus would have been over 15,000 tons at the end of the year.

The year 1918 started with what has proved to be an average month's surplus stock of zinc concentrate. While the market for zinc ores ranged from $50 to $65 per ton, lead ores sold at $80. Calamine held steadily at $30 to $45 during the early months. With the exception of an advance in lead to $85, the ore markets remained stationary until the middle of March, when zinc began a sharp decline, immediately threatening to demoralize the entire industry if not checked. Spelter remained fairly firm, and zinc-sheets, into which a large part of the district's output was entering, had been sold to the Government on a fixed price which should have maintained an ore market at $80 to $90 per ton. It was at this juncture that the ore producers' woes were



TYPICAL SCENE IN THE WEBB CITY DISTRICT, MISSOURI carried to Washington before the War Industries Board, resulting in an agreement being made between the sheet-zinc manufacturers and the high-grade zinc ore producer, to fix concentrate at $75 as long as the Government sheet-zinc price was maintained. This agreement was reached in the latter part of April, by which time blende prices had declined to $40 to $45. Lead ore had also dropped to $80 base at this time. The increase in the base price for high-grade zinc ore helped to stabilize the market, and through an allocation board sales were made. The first allocation amounted to 1300 tons weekly, and was made in the first week of May, and continued unchanged for 33 weeks. During that period 38,052 tons of high-grade blende had been sold on the $75 market, compared with an open market for the same class of ores ranging from $40 to $65. The gain to the field by the arrangement during the war period amounted to approximately $750,000. A maximum of 45 mining companies participated in the allocation of the tonnage, while the average reached 29 for the entire period. The proportionate share allocated to the producer ranged from 30 to 46% of the output of high-grade product. The end of the War brought an end to the agreement and the market dropped at the end of November. The range for the last month of the year was $37.50 to $45, except for 600 tons of high-grade which sold at $55. Calamine held its own much better throughout the year, the base range being from $25 to $35 most of the time.

The lead-ore market also began to move upward in June and by the middle of July had reached $100, at which price it held steadily till the first week of December, when it was cut 20%, the last week of the year seeing the base for 80% lead going down to $65. The average price of blende for the year was $51.68, of calamine $33.70, and of lead $89.73 per ton.

The decrease in tonnage was large for both blende and calamine. The former decrease over 1917 was 34,137 and calamine 15,137 tons. In value the decrease amounted to $9,038,505 for blende and $677,062 for calamine, when compared with 1917. Lead ore showed an increase in tonnage of 3431, but a decrease in valuation due to lower prices. The difference in the average price of lead ore was in favor of 1917 by $7.89 per ton.

Summarizing the shipments during 1918 we get the following:

Product	Tons	Average price per ton	Total value	Average surplus, tons
Blende	371,956	$51.68	$19,380,482	22,830
Calamine	15,032	33.70	506,581	.....
Lead	68,738	89.73	6,168,062	2,162

GOLDFIELD, NEVADA

Work in the Spearhead, Merger, Crackerjack, Great Bend, and Lone Star.

The new development in the Spearhead continues to create interest. The ground is highly mineralized and has every indication of making into a big orebody. In this mineralized mass are bunches of rich ore. At present a raise is being driven to the shale contact, while driving continues on the ore to determine its extent. The cross-cut is still in ore.

The Merger company has an excellent showing and has shipped several cars of ore lately. There is 6 ft. of ore, averaging $30 per ton, on the 1350-ft. level. A winze is contemplated at this point. The raise continues promising.

The Crackerjack company has secured a lease on the Florence. Work has been started and a good shoot has been discovered.

Work at the Great Bend is progressing, and the management is highly pleased with results. A carload of ore was shipped lately.

Work at the Lone Star is well under way. The hoist and other equipment has been overhauled, and in a few days cross-cutting and driving will commence on the 250-ft. level of the Nelligan shaft. Work on other parts of the property will be started either by the company or responsible lessees as soon as equipment can be brought onto the ground. Gerald B. Hartley, vice-president and superintendent of the company, arrived here from Mazuma, Humboldt county, last month. The property consists of 15 patented claims, on the south slope of Vindicator mountain. It lies immediately east of the Spearhead, Blue Bell, and Grandma; and north of the Merger, Blue Bull, and Commonwealth mines. Considerable work has been done, and in the early days of Goldfield several carloads of high-grade ore was shipped from the ground now accessible to the Nelligan shaft. Two other shafts are each 300 ft. deep. The management will undertake extensive development of what is regarded as promising ground, in which there is every likelihood of finding orebodies similar to those just discovered in the Merger, Spearhead, and Blue Bull.

RENO, NEVADA

Notes from Scattered Mining Centres.

The Panama Canal Mining Co., owning the only mining property that has operated in Ormsby county in recent times, has shipped a 50-ton carload of silver ore and has shut-down for the winter. The mine is in the Voltaire district.

A Christmas dividend of one cent was paid by the Fairview Round Mountain Mining Co., the third since September. The mine, situated at Round Mountain, in Nye county, produced $28,000 gross in October, and is said to be maintaining that output. As the gold is all free, recovery is by amalgamation. Louis D. Gordon, president of the Round Mountain Mining Co. and manager of the Cerro Gordo mine in California, is at the head of the company.

The Como Consolidated mine, near Virginia City, is said to have a large quantity of high-grade milling ore and is treating it in a modern cyanide plant.

Development is progressing on several properties in the Peavine district, a short distance from Reno.

Mines and leases in the National district, in the northern end of Humboldt county, are producing small quantities of rich ore. Lessees at the Buckskin National have made a shipment and declare that some of their product is worth $50 per pound. Miners from the district say that a large tonnage of good milling ore has been exposed in opening the high-grade.

Two mills in the Gold Circle district are treating ore from several mines. The Elko Prince is the largest producer, and its rather narrow but rich vein has been opened at a depth of over 800 feet.

At the old camp of Candelaria, the Lucky Hill mine, owned by the Candelaria Consolidated Mines Co., is shipping 200 tons weekly, the product containing from 20 to 35 oz. of silver per ton. The same company has the old Mt. Diablo and Argentum mines, once large producers, and is blocking out a large tonnage of ore with a view to providing a mill and treating both the ore from these mines and the large amount of tailing from early-day amalgamation mills.

At Pioneer, miners with supplies and powder have arrived at the Consolidated Mayflower property, control of which has been acquired by a group of mining men including J. H. Miller of Hawthorne; F. M. Manson of Reno, manager of the Western Ore Purchasing Co.; W. J. Tobin, president of the Reorganized Pioneer Mines Co.; P. H. O'Neil, stockman and mine operator of Los Angeles; and J. H. Kendall, former superintendent for the Goldfield Consolidated company. Mr. Kendall is president and manager of the Mayflower company and has assumed charge at the mine. The 15-stamp mill is to be remodeled and enlarged to more than double its present capacity.

Samuel Newhouse of Utah, while at Reno recently, said that the Louisiana Consolidated mine at Tybo would resume work in the near future. He expressed confidence in the future of the property.

Goldfield miners have exposed some good ore in working a lease on the Life Preserver group at Tolicha, 50 miles southeast of Goldfield. The claims are owned by J. Jordan and 'Jumbo' Yeiser, and were worked last year under a short-term option by men in the employ of George Wingfield and Zeb Kendall, when some milling ore was exposed in prospect shafts.

Frank Hertzer and Dan O'Keefe of Goldfield have opened two feet of good silver-gold ore on leased ground near Railroad Springs, 20 miles south-west of Goldfield.

Exhaustive tests in shale-oil extraction have been conducted here at the Mackay School of Mines, connected with the University of Nevada. The men doing this work have experimented with shale found near Elko and in Utah. Results are said to have been satisfactory, but incomplete; a detailed statement covering the work is promised shortly.

Treatment of mill tailing by the Goldfield Consolidated Mines Co. has been discontinued for the winter. The Lidgerwood radial cableway has been delivering 700 tons of tailing daily to the cyanide department of the 1000-ton mill. Freezing of the water supply and wet tailing, with plant breakage due to cold and the necessity of employing a larger working force, prompted the decision to close down during the winter. The mill continues to treat approximately 6000 tons of ore monthly, divided equally between flotation and cyanidation, and 300 tons weekly of ore from the Tonopah Divide mine is received in the cyanide department.

DURANGO, COLORADO

Present Conditions in the San Juan Region.

The San Juan region is rapidly recovering from the epidemic of influenza that swept over it, and development has been resumed at many properties. However, production of ore during the winter will be materially reduced, as a number of smaller operators have ceased for the season. The Red Mountain railroad has been closed owing to the heavy snowfall.

Ouray.—The McClellan-Dunmore tungsten claims are under lease and option to De Golyer, who plans extensive development. A small force is engaged on preliminary work, and the Gold Crown mill is being re-modeled to dress both tungsten and other ores.

High-grade ore has been discovered in the Hidden Treasure, some samples carrying over 300 oz. of silver per ton.

Silverton.—The outlook is encouraging for a busy and prosperous season during 1919. Extensive work is under way by the Sunnyside M. & M. Co., Gold King Extension Co., Caledonian M. & M. Co., Mayflower Leasing Co., Henrietta Copper Co., and the Red Mountain Mines Co., and will make heavy and continuous shipments.

The Sunnyside company, after an idleness of over a month, resumed milling on December 26. The acute labor shortage is being relieved by the continuous arrival of common labor, but machine-men and skilled miners are still in great demand.

The Pride of the West, one of the leading producers of the district, closed for the winter, owing to scarcity of labor and high operating costs.

The Mayflower will continue to operate during the winter and is shipping heavily at present. The Mayflower had a successful season, having continued work with hardly any interruption, except while the Iowa-Tiger mill was shut-down.

Development continues at the Buffalo Boy, including the driving of a cross-cut tunnel 50 ft. long to cut a vein.

The Caledonian is now in the producing class, and a large number of men are employed at both mine and mill. Preliminary mill runs gave satisfactory returns.

The Henrietta company is doing extensive work, in addition to shipping high-grade copper ore. The outlook for heavy shipments during 1919 is promising.

The long tunnel being driven to cut the main vein in the workings of the Ariadne is almost completed, and the mine is being prepared for shipping.

Telluride.—This district has continued to ship heavily, although the Belmont Wagner company has closed the Alta mine and mill owing to heavy snow and scarcity of labor.

The Tomboy continues to ship iron concentrates.

The Smuggler Union is shipping all classes of ore.

The Liberty Bell has cut down the force at the mill.

A group of vanadium claims is under development by the Colorado Vanadium Co. Equipment includes a compressor and pipe-lines for drills. A two-bucket tram is being constructed to carry ore from the workings to rail. The ore will be treated at the Primos Chemical Co.'s plant.

Rico.—The outlook for this district is promising, better than for years past. Numerous new developments are under way, and the leading producers are installing electric motors and compressed-air drills. The heavy snow that has fallen insures an abundance of water-power during the coming year. Supplies and fuel are now being hauled to many of the properties in anticipation of a continued winter campaign.

The outside work at the alunite field is being hurried before the heavy snow falls, as the elevation is 12,000 to 13,000 feet.

The Rico Mining Co., known as the Syndicate Mining Co., is developing the Group and Syndicate tunnels. Compressors and electric power are being installed, and work will continue during the winter, with the prospects of light shipments. The virgin ground near the Vestal shaft of the Group tunnel gives promise of good orebodies.

The Marmatite M. & M. Co., is now sending out 300 tons of ore per month, and at present is the only shipper from the district. A number of other properties in addition to the Rico Argentine are under development by this company, and power-lines are being built to all of these holdings, also compressed-air lines for drilling. As the labor shortage is relieved this company will gradually increase its output of ore.

The lawsuit between the Rico Consolidated Mining Co. and the Rico Argentine company has tied up a large body of good ore. The former claims trespass, while the latter claims apex rights.

The Rico-Wellington has discontinued operations for the winter.

PORCUPINE, ONTARIO

The new president of the Dome Mines, in place of the late Captain De Lamar, is Jules S. Bache, of the firm of J. S. Bache & Co., brokers of New York, and a director of many prominent corporations. It is intimated that one result of the change may be in the direction of greater publicity concerning the mine, about which little official information has lately been forthcoming. It is generally anticipated that the mill will resume operations early in the new year.

The Dome Lake has appointed Charles A. Randall as manager in place of A. H. Brown, who resigned. The shaft will be put down to 600 feet.

The Davidson is now operated by electric power. An orebody of high grade has been opened from the 460 to the 500-ft. level. There has been some trouble from water, necessitating installation of additional pumps.

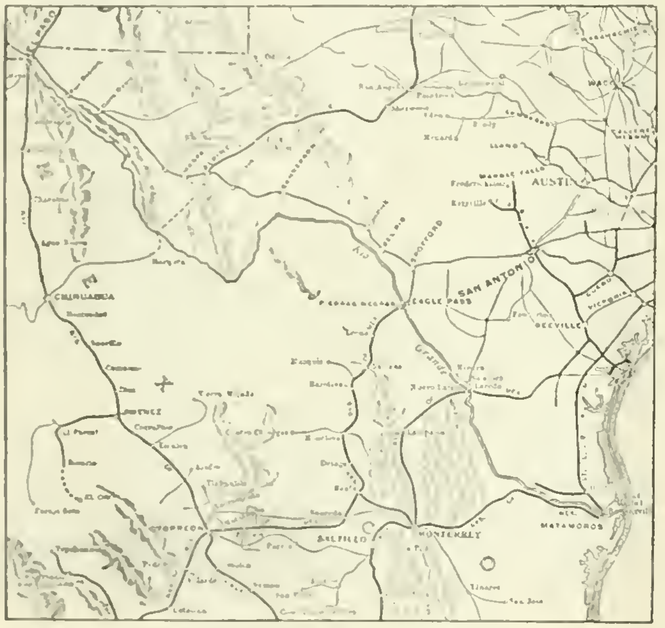
Operations will be resumed at the Sovereign mine, the president, C. W. Moodie, having underwritten 100,000 shares at 25c. each to raise the necessary funds.

SAN ANTONIO, TEXAS

Conditions in Mexico, as Seen by Reliable Authorities.

According to L. H. Coley, manager in Mexico for the Ingersoll-Rand Co., with headquarters in the City of Mexico, industrial conditions in that country are showing material improvement since the armistice was signed. He said:

"There is still some interference from the lawless elements in the western districts, but not nearly so bad as for the last few years. Nearly all the mines are being worked, especially those owned by large foreign companies. Ores are being accumulated with a view to supplying the smelters with the quantity and variety of ores needed to make continuous operation possible, and the great smelters are being put in the best possible condition in anticipation of heavy business. The administration has decided that it is unprofitable for the mines to remain idle, as the taxes are needed by the Government, therefore the railroads to the mines are kept in as good condition as possible, supplies are transported with but little delay, and they are doing what they can to further production. I travel to all parts of Mexico and have not been delayed, hampered, or even insulted during all my journeys. Since the signing of the armistice there has been a wonderful change in the attitude of the masses, and there is no anti-American spirit in evidence. Americans are now wanted and welcomed. There is a complete alignment of allies in Mexico as there is in Europe at this time, and the Mexican masses expect that their affairs will brighten after the peace compact has been signed, believing that Uncle Sam will be their good friend, and that they will get a square deal from all foreign nations in the future. There is considerable activity among the largest foreign mining companies in the acquisition of desirable mining properties, and any good prospect promptly receives careful examination. The British are notably active in this regard, and I take it to be a sign that they are convinced that their investments will be safe and profitable. Common laborers in the mines now receive P1.50 per day and the higher class of operatives get from P3 to P5 per day. They are spending money freely, and business is good with the merchants near the mines and reduction works. That is, with all but German dealers, who are beginning to feel the pinch of the voluntary discrimination against everything German. Their young men find it difficult to obtain employment, and in various ways they are now reaping what they sowed so recklessly to the very last. What the Mexican people want now is plenty of work at fair pay, and they will be contented and happy; they have had their fill of war and want no more of it. The influenza greatly interfered with mining and there is still a shortage of labor in many localities, but those who were frightened away are gradually returning. The question most frequently heard is: 'When is Uncle Sam going to help Mexico as he has helped all other countries?' "



NORTH-EASTERN MEXICO AND TEXAS.

Miss Elisa Cortez of San Antonio, who has just returned from Mexico, where she investigated the possibilities of extending the activities of the Y. W. C. A., said:

"Mexico is clamoring for the benefits of our work as the girls and women are now employed in all sorts of occupations—just as they have been in the United States during the War. The women say this aid is essential to the hoped for reconstruction of social conditions in the Republic, and they will welcome with open arms the presence of a branch of the organization that shall have a wide scope of operations throughout the industrial districts, especially. The people of the City of Mexico also are highly desirous for an extension of Young Men's Christian Association activities, having been greatly pleased by the workings of the Association thus far. Business seems to be nearer the normal than I had supposed. At San Rafael the paper-mills, which will give employment to 1800 people, are about to start operation, and many other large factories will soon resume work on a large scale. The railway line from the City of Mexico to Nuevo Laredo is maintaining its scheduled service. There is a noticeably large number of Americans at the capital, having mining and other interests of importance, and the talk is all favorable to a steady restoration of old-time prosperity. People do not hesitate to walk along the streets of the city at night without guards, which has not been the case for a long time previously. All thoughts of the masses are centred on the peace conference at Paris, and you would think they were parties to the negotiations, so eager are they for news. They seem to feel that good is coming to Mexico from the final outcome. The people are more industrious and more eager for employment than I can remember, and there are not nearly so many idle ones."

CRIPPLE CREEK, COLORADO

Operations of the Smaller Properties.

Operations have been resumed by the Blue Flag company on Raven hill. The shaft is being sunk from 1227 to 1400 ft. A raise is also being driven from the 1100 to the 800-ft. level for ventilation. Cross-cutting is proposed to prospect ground east of the shaft toward the Cresson mine.

The Victory company shipped 1226 tons, worth $13,872, from the Howard shaft of the Mary McKinney company on Gold hill during the nine months following acquisition at the end of April 1918. The company also shipped 394 tons valued at $3886 during the year.

The Anona company has leased its property, adjoining the Victor mine on Bull cliffs, for a five-year term to Math Korff, lessee of the Victor. The lessees propose to prospect this undeveloped ground—26 acres—from the 1000-ft. level of the Victor shaft.

The December output of the United company totaled 700 tons, averaging $17.50 per ton.

The Modoc company has commenced heavy production and is dispatching two cars per day during the ensuing week. The ore is coming from two ore-shoots on the 1200-ft. level. These shoots are on distinct veins. The ore will average $30 per ton.

Oregon timber has commenced to arrive for the Lincoln Mines & Reduction Co. for use in construction of its concentrating plant on Ironclad hill. The concrete foundations are ready for the machinery.

THE MINING SUMMARY

ALASKA

Nome.—According to G. C. Martin, of the U. S. Geological Survey, Seward Peninsula yielded gold worth $1,140,000 during 1918, against $2,747,000 in 1917. Nome contributed $455,000; Council, $293,000; Fairbanks, $118,000; Koyukuk, $145,000; Solomon, $62,000; and Kougarok, $60,000. Twenty dredges were operated, eight less than in 1917. They yielded 40% of the gold from the Peninsula. The 28 underground mines yielded 25%, 24 hydraulic mines 23%, and 55 open-cut mines 12%. About 56 oz. of platinum was recovered from all placers.

ARIZONA

Benson.—It is reported that the old smelting plant here, which includes a 250-ton copper stack never used, is to be blown-in within the next three months. The plant has been taken over by the recently incorporated Arizona Smelting & Power Co., of which C. E. Goetz is president. The company has an old slag dump of what is said to be good fluxing material, and it expects to draw ores from Patagonia, Johnson, Helvetia, and other districts.

Bisbee.—Phelps Dodge mines yielded 12,563,000 lb. of copper during December. There has been almost a general decline each month since the 20,815,110 lb. in March.

Douglas.—The Copper Queen smelter management announces that it is in the market for custom ore and will pay 16 cents per pound for copper pending a settled market price.

Globe.—The general manager, W. G. McBride, has announced that the Old Dominion smelter has adopted a 15-cent payment for copper, settlements in excess of that price from copper sold going to the shipper of custom ore when sale is made. The Old Dominion produced 2,686,000 lb. of copper in December, the highest yield since the 3,368,000 lb. in June.

Owing to a bolt destroying the coils of a 200-hp. motor in the Old Dominion flotation plant, about 1500 men in this district are out of work. As the spare motors were also damaged in some manner, the shut-down is indefinite. The damage is said to have been done purposely.

A 50-ton cyanide mill is to be built by the Gila Monster Mining Co. for its Richmond Basin property, 7 miles north of Globe. According to the superintendent, W. H. Seamon, there is 30,000 tons of 15-oz. silver ore on the dump; also some rich ore in the mine.

Miami.—Copper output of the Miami company in December was 4,989,435 lb. The average during 1918 was 4,850,000 lb. per month. The company pays $1 per share on February 15. This is equal to $747,114.

Inspiration Consolidated produced 7,350,000 lb. of copper during December. This is the lowest yield since February.

Patagonia.—It is now announced that the well-known Three R mine has been purchased by the Gunn-Thompson interests through the Magma Copper Co. for $750,000. This property has been under inspection for some time.

Ray.—Copper output of Ray Consolidated in December was 5,800,000 lb., the lowest yield for the year. In May it was 8,120,000 pounds.

Superior.—A 30-ton ball-mill and flotation plant is now working at the Silver King mine. Five tons of concentrate sent to El Paso assayed $1500 per ton, mostly in silver. There is said to be 10,000 tons of $20 ore developed.

The Magma Chief has purchased the Sombrero Butte property.

CALIFORNIA

Blythe.—The Chamber of Mines and Oil of Los Angeles recently received the following letter from P. H. Bray, a leading manganese producer in Riverside county: "Herewith is a brief description of the manganese mining situation in the Ironwood Mountain district, Riverside county, California. This district contains a great many unusually large deposits of manganese ore—probably the best quality obtainable in the United States, as it contains but a small perpentage of silica and is easily handled. Prior to the middle of November there were eight producing properties in this district. Since that time, however, six of these have been forced to close—including the Talbot, Grose, Parsons, Maybery, Perkins, and Nicholas properties—as they were unable to obtain a market for their ore at any price. Two of the larger properties—the Black Jack and the Bray—were fortunate enough to have contracts with the Western Ore Purchasing Co. for the account of the U. S. Steel Corporation, which contracts will run for about seven months longer. Both of these properties are well developed, and at the present time have practically 100 carloads (40-ton cars) of ore blocked-out. The Bray property has a 100-ft. shaft and about 250 ft. of drifts on the lead, which ranges from 3 to 9 ft. in width. The various manganese properties in this district could easily produce 25 or 30 carloads of ore per month with their present equipment if a market could be found for same. It is a deplorable condition that the properties, which have been forced to close, had been extensively developed at the specific request of Government representatives, and at great expense to the operators. Practically all the owners or lessees of these properties are poor men who have put all the money they had, or could raise, into the development of these mines. Also, the money which has been taken out during the past year in nearly every instance has been put back into the properties in the form of machinery and other operating equipment, as it was the general opinion that the demand for manganese ore would continue indefinitely. When the market closed all these operators had large quantities of ore mined; in fact, one man had the ore loaded on the car, when the order for same was cancelled. As these men were working without contracts, they were unable, in many cases, to even pay their workmen or other operating expenses in connection with mining the ore. It is needless to say that the present condition of affairs is a matter of great discouragement to the miners. . . ."

Daggett.—The Ord copper mine in San Bernardino county, formerly known as the Osborn, 12 miles south of this place, is being developed by New York people, who agreed to do 300 shifts of work per month. The ore is said to occur in wide contact veins between different eruptives, and carries up to 4% copper and $4 gold per ton.

Grass Valley.—During 1918 the North Star Mines Co. distributed $100,000 in dividends. This was on June 29, and amounted to 20 cents per share. The total to date is $5,437,040.

Madera.—It is reported that the old California copper mine, 12 miles from this town, has been leased to W. T. Perry of Fresno. The workings have been flooded for 20 years, and the water is considered to carry copper. Dumps amounting to over 20,000 tons are to be treated by simple water leaching.

Placerville.—A 2-ft. pay-shoot of good-grade gold quartz between well-defined slate walls and more than 100 ft. long is being mined and milled at the Burger mine, within the city limits of Placerville. The vein trends west of north and dips slightly to the east. The present working-shaft, now down 70 ft., is an incline on the foot-wall. About 300 ft. north of this rich shoot recent work has disclosed another larger shoot of similar rich quartz in the same formation. The quartz is the well-known 'blue ribbon rock' of the Mother Lode, showing free gold along the ribbon seams, which also contain high-value sulphides. The mine has been under development for the last three months, under lease and bond, by N. H. Burger of Placerville, A. L. Conger of Berkeley, and T. B. McLane of Seattle. A No. 3 Gibson quartz-mill and concentrator, handling 8 tons daily, has been used to sample the ore as work progressed. Both the mine and the plant have been so satisfactory that a No. 1 Gibson mill and concentrator of 30-ton capacity, an electric hoist, mine pump, and other improvements are to be made. After the new equipment is erected the mine will be operated continuously.

Plymouth.—The Plymouth Consolidated pays 24 cents per share, $57,600, on January 31. Results during October and November are as under:

	October	November
Ore treated, tons	10,550	8,600
Gold yield	$55,700	$51,000
Working expense	36,000	33,600
Development	4,500	3,600
Surplus	15,200	13,800

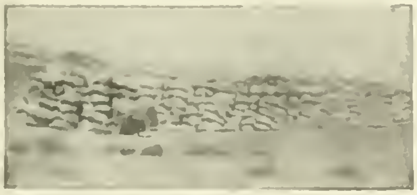
On the 2450-ft. level, the north foot-wall drift is out 378 ft., assaying $7.10 per ton across 67 inches.

COLORADO

Cripple Creek.—The Portland Gold Mining Co. pays 2 cents per share, equal to $60,000, on January 20. This makes a total of $11,317,080.

Cresson Consolidated pays 10 cents per share on January 10. This is equal to $122,000, and makes $7,271,163 to date.

Kokomo.—The Mutual Co-operative Mining Co. during 1918 shipped 1280 tons of ore from its Golden Queen mine, settlements totaling $20,018. The Silver Queen is reported to be developing well. The Gold Hill mine may be sold. The tungsten mine at Lee Hill, Boulder county, is closed and is for sale.



ORE READY FOR TRANSPORT TO RAIL IN THE SAN JUAN REGION

Red Cliff.—A mill is being erected at the Alpine mine, which is owned by Lincoln, Nebraska, people.

The Empire Zinc Co. has acquired additional property at Red Cliff. Daily shipments of concentrate amount to 16 carloads, sent to smelters at Canon City and East St. Louis. A long tunnel is to be driven to facilitate mining the ore.

Telluride.—The Primos Chemical Co. has a good many men working at its mines up Leopard creek, near the old town of Placerville. Buildings, tramway, compressor station, and other equipment are being constructed. Ore was formerly carried on mules over a mile to rail at Placerville, from where it was sent to Vanadium, in San Miguel county, for concentration. The new tramway will dispense with mules.

MICHIGAN

Houghton.—On December 28 a rush shipment of copper, amounting to 3,136,000 lb., was sent by rail from here to New York. During the previous 30 days no metal was moved, excepting small lots.

In the Seneca company's shaft the Kearsarge lode was cut at 1625 ft. The ore carries 1½% copper. Sinking was started on February 13, 1918. The new head-frame is finished. W. J. Uren is superintendent.

Mohawk pays $2 per share on February 1.

MISSOURI

Joplin.—Production of the Tri-State region last week was as under:

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	148	..	173	$17,040
Missouri	944	45	168	52,456
Oklahoma	4,231	..	392	209,684

Average prices were $44, $38, and $60 per ton, respectively. The surplus stock of concentrate has been reduced to 9000 tons.

MONTANA

Butte.—Operations in this district have been curtailed somewhat owing to the unsettled metal markets.

The Original and Leonard mines of the Anaconda company were closed on January 3 for alterations, and will remain so for several months. The Original has a two-compartment shaft, but a pump compartment will be added during the shut-down.

The Butte & Superior company allowed its option on the Germania mine to lapse on January 1. All machinery and supplies have been taken away.

Manganese producers have not much chance of getting Government aid, according to Lieutenant-Governor W. W. McDowell, who recently returned from Washington. A tariff of $20 per ton would be necessary to protect the domestic industry from foreign ore. Steel works are said to have large stocks of manganese. While production of manganese ore has ceased at Butte, it is at half capacity in the Philipsburg district.

Anaconda pays $1.50 per share, $3,496,875, on February 24. The general manager, John Gillie, estimates the 1917 production of metals as 298,000,000 lb. of copper, 74,700,000 lb. of zinc, 10,700,000 oz. of silver, and 64,500 oz. of gold, valued at $93,998,700. The red metal output was 11% less than in 1916. Comparison with 1917 is unsuitable, owing to the labor troubles during that year.

Anaconda produced 21,900,000 lb. of copper during December. The average monthly output in 1918 was 24,800,000 lb. May was the highest with 28,400,000 pounds.

As the company has suspended treatment of custom zinc ore the Butte & Superior is reported to have reduced operations by half.

NEVADA

Ely.—Nevada Consolidated produced 5,800,000 lb. in December, the lowest return for 1918. The average for the previous 11 months was 6,660,000 pounds.

NEW MEXICO

Santa Rita.—Chino Copper yielded 5,507,635 lb. during December, the lowest for the year, save August.

OKLAHOMA

Commerce.—The Lennan Lead & Zinc Co. is to move its mills to the Oka lease, near Picher.

Picher.—Production of Oklahoma mines last week was 4231 tons of blende and 392 tons of lead, valued at $209,684.

UTAH

Bingham.—The apex dispute between the Utah Metal and Utah Consolidated companies has been settled. Apex rights of the former, as well as any claims it may have against the Utah-Apex company, are transferred to the Utah Consolidated, which concedes to Utah Metal certain rights to work in its ground.

The Utah Copper Co. laid-off between 500 and 600 men at its mine and mills last week, according to reports from Salt Lake City. The company produced 13,835,000 lb. during December. This is the lowest since February, but the winter months always show a decline. In August the yield was 19,920,947 pounds.

Gold Hill.—A 40-ton shipment of ore from the Western Utah Extension mine to the smelter averaged 60 cents gold, 4 oz. silver, and 7.15% copper, equal to $25 per ton. This mine is now 450 ft. deep. A. E. Custer is manager.

WASHINGTON

Chewelah.—The United Copper Mining Co., operating near here, is the first of the big mining companies so far reported that has cut wages since the end of the War. The reduction is a substantial one, as follows: Miners, skip-tenders, timber-men and hoist-men, from $5 per day to $4.25; shovelers and motormen, from $4.50 to $3.75; blacksmiths, from $5.50 to $4.75; blacksmiths helpers, from $4.50 to $3.75; and millmen and carpenters, from $4.50 to $4. "We worked in 1918 for the men and the Government, but this year we will operate for the benefit of the stockholders," explained the president, Conrad Wolfle. "We made about $45,000 last year, but had a hard struggle to do it. The best part of it is that after explaining the situation to the men they see the justice of our position and of 75 men employed only five left."

CANADA

British Columbia

Nelson.—The first session of the committee appointed to investigate the rates charged British Columbian mine operators for treatment of their ore by the Consolidated Mining & Smelting Co. at Trail will be held January 21 at Nelson. The personnel of this committee is S. S. Fowler of Riondel, Ivan de Lashmutt of Silverton, and James Anderton of Kaslo. The Provincial government will be represented by A. G. Langley, resident engineer with headquarters at Revelstoke.

Trail.—The Consolidated M. & S. Co.'s smelter here produced metals and by-products worth over $12,500,000 during 1918. The products were 40,662,704 lb. of lead, 25,405,797 lb. of spelter, 9,951,781 lb. of copper, $2,000,476 of silver, $1,444,000 of gold, 3926 tons of sulphuric acid, 174,178 lb. of bluestone, and 75 tons of lead pipe.

Vancouver.—An international mining convention will be held at Vancouver some time during March. It had been proposed that this gathering should be called for January, but a postponement to the latter date has been agreed on by members of the Vancouver Chamber of Mines. The convention has the sanction of Hon. William Sloan, Minister of Mines, and the resident mining engineers of the various mining districts of the Province are expected to take an active part. The proceedings are likely to be of special importance.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Francis Drake is at Monte Video.

George Crerar is at San Luis Potosi, Mexico

Morton Webber is on his way back to New York

J. S. Morgan of Juneau, Alaska, is at the Stewart hotel

Bulkeley Wells is president of the American Mining Congress.

H. H. Knox, of Knox & Allen, has returned to New York from Mexico.

E. M. Hamilton has gone to Parral, Mexico, where he will be about two months.

Arthur L. Pearse has gone from New York to London, intending to return shortly.

H. J. Sheafe, Captain in the Engineers, has returned from France to Saratoga, California.

Morris P. Kirk is now manager for the Yellow Pine Mining Co., at Goodsprings, Nevada.

W. G. Devereux, Lieutenant-Colonel of the 144th Field Artillery, has returned from France.

F. W. Bradley is making one of his periodical visits to the Bunker Hill & Sullivan mine at Kellogg, Idaho.

A. D. Nicholas has been appointed comptroller for the Calumet & Hecla and its subsidiary corporations.

Hugh F. K. Picard, of Sulman & Picard, is president-elect of the Institution of Mining & Metallurgy, London.

William H. Landers, Major in the U. S. Army, has secured his discharge and will be in San Francisco about February 1.

Robert Hawxhurst, Jr., has resigned as manager for the Eden Mining Co., in Nicaragua, and is now in San Francisco.

W. D. B. Motter, Jr., until recently manager for the Benson Mines Co., has joined the headquarters staff of Guggenheim Brothers.

Maurice Altmayer, Captain in the French Artillery, is here as a representative of the Department of Franco-American War Co-operation.

F. D. Baker, lately chief engineer to the Colorado department of the A. S. & R. Co., has retired, to engage in consulting practice with his sons at Denver.

Owen F. Brinton, formerly at Butte, has been appointed manager for the Western Utah Copper Co., on the resignation of **Duncan MacVichie**, who becomes consulting engineer to the company.

Alfred C. North has been granted a leave of absence from his duties as engineer for the Eden Mining Co. in the Pis Pis district of Nicaragua, and is now on his way to the United States with his family for a vacation.

E. H. Dickenson, formerly with the Mond Nickel Co., Bruce Mines, Ontario, Beatson Copper Co., La Touche, Alaska, and Nevada Consolidated, Ely, Nevada, has recently been appointed general manager of mines for the Tata Iron & Steel Co., at Sakchi, India.

F. H. Hawkins, who for several years past has held the position of chief assayer for the Standard-Silver Lead Mining Co. of Silverton, B. C., has gone to Anyox, B. C., to accept an appointment with the Granby Consolidated Mining & Smelting Co. **Thomas Brown** will succeed him at the Silverton assay-office.

The annual meeting of the Canadian Mining Institute will be held at Montreal on March 5, 6, and 7.

THE METAL MARKET

METAL PRICES

San Francisco, January 14

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	23.00
Lead, pig, cents per pound	6.25— 7.25
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb.	$105
Spelter, cents per pound	9.50
Zinc-dust, cents per pound	16.00

EASTERN METAL MARKET

(By wire from New York)

January 14.—Copper is quiet and easy. Lead is dull though steady. Spelter is inactive and weak.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 48.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, due to a drop in price.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71½c. on the Pacific Coast. This will continue for some months.

LEAD AND ZINC IN 1918

The mine output of lead and zinc in the United States declined greatly in 1918, according to a statement compiled by C. E. Siebenthal of the U. S. Geological Survey from reports and estimates by producers and from the records of the Bureau of Foreign and Domestic Commerce. The output of soft lead by mines of the Mississippi Valley and Eastern States was 250,000 short tons, and that of argentiferous lead by mines of the Western States was 313,000 tons, a total of 563,000 tons, compared with 273,046 tons and 378,110 tons, respectively, and a total of 651,156 tons in 1917, a decrease of nearly 100,000 tons. The decrease in output of domestic lead was partly made up by an increase in imports of lead in ore and bullion, particularly from Canada and Mexico, which are estimated at 14,100 tons and 78,600 tons, respectively, against 5867 tons and 62,891 tons in 1917.

The recoverable zinc content of ore mined in 1918 was about 627,000 tons, compared with 711,192 tons in 1917. The output of the Eastern States was 127,000 tons, of the Central States 297,000 tons, and of the Western States 203,000 tons, compared with 155,169, 310,471, and 245,552 tons by those divisions in 1917. The output of the Central States fell off proportionately less than that of the other sections. Montana apparently had the largest output, with 105,000 tons, and New Jersey and Oklahoma were next, with 100,000 tons each. Imports of zinc in ore fell off from 72,470 tons in 1917 to 24,000 tons in 1918. The zinc content of imports from Mexico decreased from 45,697 tons in 1917 to 18,000 tons in 1918.

The production of primary domestic desilverized lead in 1918 was about 284,000 tons, of soft lead 210,500 tons, and of desilverized soft lead 47,000 tons, making a total output from domestic ores of 541,500 tons of refined lead, compared with 549,895 tons in 1917, made up of 303,679 tons of desilverized lead, 187,735 tons of soft lead, and 58,481 tons of desilverized soft lead. The output of lead smelted and refined from foreign ore and bullion was 96,500 tons, compared with 62,319 tons in 1917. The total of lead smelted or refined in the United States was thus 638,000 tons, compared with 612,214 tons in 1917. The production of antimonial lead was 22,000 tons, against 18,647 tons in 1918. Exports of lead of foreign origin were 38,000 tons and of lead of domestic origin 64,500 tons, compared with 41,160 tons and 56,209 tons, respectively, in 1917. The quantity of lead available for consumption in this country was 540,000 tons, compared with 515,258 tons in 1917. In both years some of the available lead was shipped abroad for use of the American Expeditionary Force, but such shipments are not recorded as exports. The average price of lead at New York was 7.6 cents per pound, compared with an average value of 8.6 cents in 1917.

The production of primary spelter from domestic ores in 1918 was 502,300 tons, and from foreign ores 23,300 tons, a total of 525,600 tons, compared with 584,597 tons and 84,976 tons, respectively, and a total of 669,573 tons in 1917. Of the output of domestic spelter over 29,000 tons consisted of electrolytic spelter, including some that was refined from prime Western metal. Exports of spelter made from foreign ores were 24,400 tons, and of spelter from domestic ores 78,600 tons, compared with 60,268 tons of foreign and 153,455 tons of domestic spelter in 1917. Stocks of spelter at smelters and in warehouses at the end of the year are estimated at 36,000 tons, and the apparent consumption during the year was 440,000 tons, compared with 413,984 tons in 1917. The decrease in exports and the increase in apparent consumption are accounted for by the shipments for use of the American Expeditionary Force, which are not recorded as exports and hence appear as domestic consumption.

At the end of November, 123,033 retorts were in operation at plants having a total of 165,000 retorts. The average quotation for prime Western spelter at St. Louis was 8 cents per pound, compared with 8.0 cents in 1917.

Eastern Metal Market

New York, January 8.

Demand for all metals is light and the markets are all lifeless; they are now entirely unrestricted except tin.

Copper demand is small, with the tendency of prices downward.

The tin market is extremely quiet, with underlying conditions very unsatisfactory.

The lead market may be considered as practically stabilized, with demand better.

Zinc buying is of small proportion, and quotations are nominally lower.

Antimony is dull and unchanged.

ANTIMONY

The market is devoid of demand and is nominally unchanged at 7.62½ to 7.75c., New York, duty paid, for wholesale lots for early delivery.

COPPER

The copper situation is mixed and full of uncertainty. There are few buyers—this is an outstanding fact. Leading producers continue to insist that their price for not only foreign but for domestic business is not less than 23c. for both Lake and electrolytic, yet some of them admit that copper has been sold as low as 21c. for January delivery. It develops that these sales do not represent large quantities, but only such orders as a few consumers here and there must place. These orders are being filled, it is understood, by a few producers who are not included in the export company, or by some re-sale or second-hand metal available from those having more than they can use. These sales are made at 21c., New York. We therefore quote the market as nominal at that level. The group of producers referred to are not acting in concert with those that formed the Copper Export Association. As to foreign demand, as far as can be learned there is very little of this. The large governments are well provided with metal, and it is the opinion of some producers here that it may be the second quarter before foreign demand makes itself felt. It is generally conceded that American production of crude copper is being curtailed decidedly, some putting it at not more than 90% of what it was in the last year of the War.

IRON AND STEEL

New steel business in the first week of the new year has increased slightly, but it is not significant. Some steel companies are operating at 85% of capacity, but the general average is 65%; the present rate, however, is equivalent to 90% of the capacity of four years ago. Consumers and producers are settling down to a contest to tire each other out, the former being convinced that prices must go lower, the latter claiming it would be disastrous if they did unless labor declines in value also. The pig-iron output for 1918, according to the blast-furnace reports of 'The Iron Age', was 38,506,249 tons, compared with 38,185,981 tons in 1917 and 39,039,356 tons in 1916. The December output was 3,433,617 tons, or 110,762 tons per day.

LEAD

As was predicted in this letter some weeks ago, based on the opinion of a lead broker, the lead market has regained its feet quicker than any of the other non-ferrous markets; the market seems to have scraped bottom. Early last week some business was done as low as 5.25c., New York, but the market soon reacted to 5.50c. and then to 5.75c., New York, which is now the quotation for early or January delivery. There has been a good inquiry during the past week and some business has been done, but the volume was not large. For spot delivery the quotation is 6c., New York. It is not believed that there is much metal available below these levels. The market may be regarded as firm and quiet. The American Smelting & Refining Co. still holds at 6c., New York.

TIN

It is not surprising that consumers of tin are gradually becoming dissatisfied with the present situation. Those desiring the metal can obtain it only at high levels, or at 72.50c., New York, if they buy from the United States Steel Products Co., or slightly under this fixed price if they purchase outside. This fact is emphasized by the appearance this week of offerings of future shipments of Straits tin from the East at 53c. c.i.f., New York, importations of which are prohibited. The market is decidedly quiet, and there is almost no activity. Small quantities held by outsiders are still being offered but they are not being absorbed. Consumers are also well provided with supplies, all of which makes it seem probable that the U. S. Steel Products Co. is not getting rid of its allotment very fast, and that the period of control may be long drawn out. Consumers are buying only when forced to. December deliveries of tin were 4050 tons, of which 3950 tons came through Pacific ports. The quantity in stocks and landing on December 31 was 185 tons. Imports of tin in 1918 were 58,027 tons, compared with 54,867 tons in 1917. Straits tin made up 34,243 tons of the 1918 imports.

ZINC

The market continues to sag and is now quoted, nominal largely, at 7.50c., St. Louis, or 7.85c., New York, for prime Western for early delivery. What little business is being done is taken by some of the smaller producers, the larger ones asking 7.65c., St. Louis, or 8c. for the same position and are disinclined to press the market. The output of spelter from domestic and foreign ore was 525,600 tons in 1918, as compared with 669,573 tons in 1917, according to the U. S. Geological Survey. The apparent domestic consumption was 440,000 tons, against 413,984 tons in 1917.

ORES

Manganese Alloys: The market for both ferro and spiegel is dead. Quotations are nominal at $225 per ton, delivered, for 70% ferro or $3 per unit with no sales reported. A carload or two of spiegel has been sold at $65 to $70, furnace, but a large order would bring a lower price, possible $60, furnace.

Tungsten: Appraisal of prices is difficult owing to the absence of demand and sales. One dealer says that high-grade ore is now offered at $15 per unit of 60% concentrate. There is no quotation on ferro-tungsten.

OIL PRODUCTION DURING 1918

According to John D. Northrop of the U. S. Geological Survey, the past two years' output was as under, in barrels:

Field	1917	1918
Appalachian	24,932,205	25,300,000
Lima-Indiana	3,670,293	3,100,000
Illinois	15,776,800	13,300,000
Oklahoma-Kansas	155,043,598	139,600,000
Central and North Texas	10,900,646	15,600,000
North Louisiana	8,561,963	13,000,000
Gulf Coast	26,087,587	21,700,000
Rocky Mountain	9,199,310	12,600,000
California	93,877,549	101,300,000
Alaska and Michigan	10,300	....
Total	335,315,601	345,500,000

Company Reports

CONSOLIDATED MINING & SMELTING CO. OF CANADA, LTD.

Property: about 20 mines in the Rossland, Kimberley, Ainsworth, Nelson, Sandon, Silverton, and Greenwood districts of British Columbia; also at Republic, Washington; also large smelter and refinery at Trail.

Operating Officials: J. J. Warren, managing director; S. G. Blaylock, assistant general manager; W. M. Archibald, manager of mines, and staff consisting of F. S. Peters at Rossland, E. G. Montgomery at Sullivan and St. Eugene, L. W. Oughtred at Highland, John Cannon at Number One, Ronald Stonier at Molly Gibson, Dan Matheson at Ottawa and Rock Candy, Edward Nordman at Emma, D. M. Tattrie at Lucky Thought, W. Clancy with Coast Copper, and G. H. Kilburn at Blue Grouse; (field operations under direction of M. E. Purcell, R. M. Macaulay, J. K. Cram, and G. H. Kilburn); T. W. Bingay, comptroller; James Buchanan, smelter superintendent, G. E. Murray, assistant; B. A. Stimmel, assistant manager of zinc plant; J. K. Batchelder, superintendent of refineries, F. E. Beasley, assistant; R. W. Diamond, superintendent of concentration and testing; G. F. Chapman, construction engineer; W. E. Jones, mechanical engineer; A. L. MacCallum, superintendent of acid plants; F. E. Lee, W. H. Hannay, and R. K. Blois, research engineers; R. Vaughan, F. S. Willis, H. Woodburn, and R. G. S. Anthony, department superintendents in zinc plant; R. H. Hatchett, chief chemist.

Financial Statement: during the year ended September 30, 1918, sales of smelter product realized $9,780,565. The total revenue, including ore and metals on hand $2,828,416, and dividends from the West Kootenay Power company $160,000, was $12,784,985. The profit, after deducting depreciation $408,557, and allowing for ore purchased, taxes, etc., was $867,259. After paying dividends, the balance was $2,148,123, against $2,360,275 at the end of the previous year. Debenture bonds of $3,000,000, at 7%, are to be issued for extensions to plant. Bank loans and overdrafts total $2,809,071.

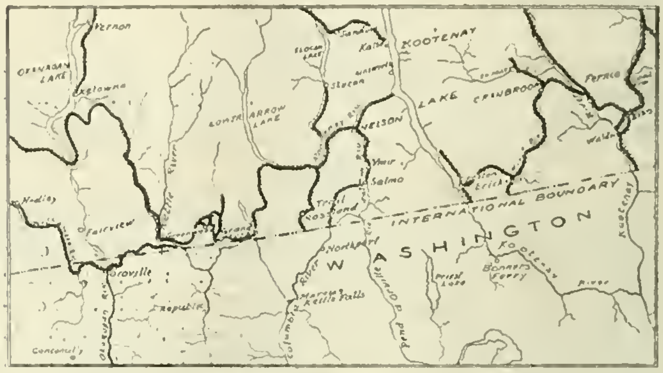
Dividends: the rate is 10% per annum, and four absorbed $1,047,745. Another distribution was paid on October 1, amounting to $261,936, and one on January 1, 1919.

Development: at 17 mines there was a total of 16,122 ft. of exploration accomplished, also 21,174 ft. of diamond-drilling. Over 100 miles of workings have now been opened. Notwithstanding heavy shipments from all the mines, ore-reserves are equal to those at the beginning of the year under review. Owing to metallurgical improvements in treating the complex ore (zinc-lead) of the Sullivan mine, many years have been added to its life. This is a valuable mine. A fluorspar mine was acquired to supply the lead refinery with acid; the Coast Copper Co.'s property is developing well; and the San Poil mine at Republic was purchased to ensure a supply of silicious ore.

Production: the smelter reduced (in 10 months actual work) a total of 374,889 tons of company and custom ores, yielding 52,917 oz. of gold, 1,708,692 oz. of silver, 38,844,946 lb. of lead, 7,982,903 lb. of copper, and 21,800,932 lb. of spelter, valued at $10,533,367. This makes a total since 1894 of 5,554,196 tons of ore, 1,831,838 oz. of gold, 28,711,042 oz. of silver, 497,171,470 lb. of lead, 83,030,313 lb. of copper, and 44,857,928 lb. of spelter, valued at $104,849,121.

From 1914 to October 1918 the company supplied the British government with 6831 tons of copper, 39,606 tons of lead, and 22,356 tons of zinc. The $700,000 advance from the Imperial Munitions Board toward extension of the zinc plant was repaid in full during the year.

Reduction Works: the financial year began under unfavorable conditions, both as to costs, metal contracts, and labor. The plant was eventually closed for six weeks on account of a strike. At the copper smelter, operation was intermittent; but metallurgical work gave improved gold recovery. The lead smelter worked unprofitably for a time, due to metal recoveries not being as high as the quantities paid for. Metal losses were lower than for years. Previously each unit of lead cost the company from 40 to 50 cents, while in 1917-'18 the same amount cost as much as $2.20. Smelting rates were therefore advanced in February 1918. The copper refinery is to be increased in capacity from 20 to 50 tons daily, at a cost of $250,000; and a rod mill is to be built costing $75,000. The sulphuric and hydro-fluosilicic acid plants were in operation all the year. Important changes were made in the zinc plant and mill.



PART OF BRITISH COLUMBIA, SHOWING CENTRES CONTIGUOUS TO TRAIL.

Power: the revenue-producing load of the West Kootenay Power & Light Co. was 22,360 hp., a slight decrease due to the unsettled conditions. A line to supply 1500 hp. to the Northport smelter in Washington was completed, and work is under way on the line to supply 5000 hp. to the Canada Copper Corporation at Copper Mountain.

BENDIGO AMALGAMATED GOLDFIELDS

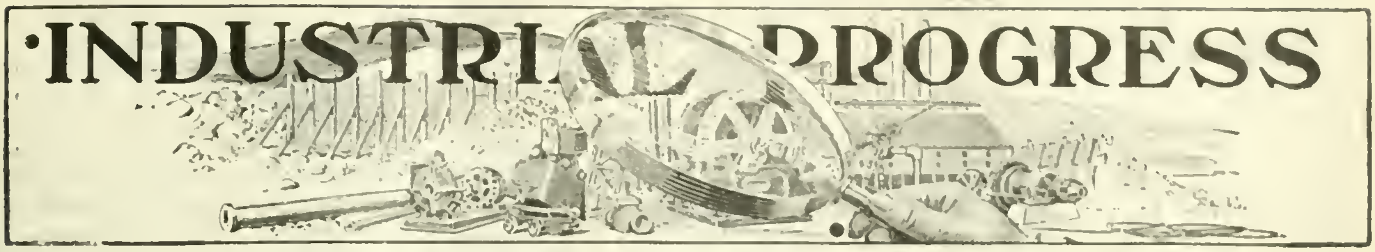
Property: this is a consolidation of the mines of about 40 companies at Bendigo, Victoria, Australia. Eight lines of 'reef' are included in the area, ranging from 4500 to 22,000 ft. in length, totaling 93,900 ft. Most of the shafts are over 2000 ft. deep, some being over 3000 ft., from which, in the aggregate, a great deal of work has been done and ore extracted. The concentration of development at certain points and operation on modern lines is the fixed policy.

Operating Officials: E. C. Dyason, managing director; A. H. P. Moline, superintendent.

Financial Statement: during the year ended July 2, 1918, receipts were £161,907 ($777,000) from gold, other items making a total of £165,789 ($797,000). Wages absorbed £108,032 ($518,000). Including the previous balance of £58,841 ($283,000) expenditures used up the total revenue.

Development: there was carried out 22,555 ft. of prospecting and development, and 3737 ft. of drilling (shot and diamond). Fifty faces were being followed. Continuous geologic examination is made, as the structure of the field is complex. A number of minor discoveries were made, but no high-grade shoots of any extent were found. Tributors are at work in certain parts of the mines.

Production; the mills crushed a total of 132,351 tons for the company, yielding, with concentrates, gold worth £134,390 ($643,000); and for tributors 14,418 tons for £27,517 ($136,000). Ore treatment—stamps, amalgamation, and concentration—is not difficult, and tailings assay only from 24 to 56 cents per ton. The report gives considerable details of underground work and drilling.



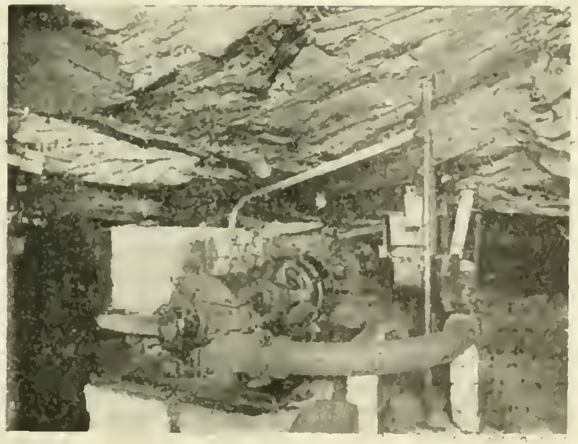
INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

ELECTRICAL EQUIPMENT FOR MINE PUMPS

The most essential requirements of mine pumps are that they run continuously and take as little power as possible. These points are met by a complete line of Westinghouse motors and control built for all sizes and commercial circuits, either alternating or direct-current. In addition to these, the advantage of lower first cost and maintenance expense, greater compactness, flexibility, and ease of control inherent with electric drive are obtained. Simplicity and ruggedness of the type CS squirrel-cage motor is especially adapted to mine-pump service, as it is built largely of steel and has nothing to wear except the bearings, which are large, well lubricated, and require little attention. These motors may be started at the motor or at a distance. When started at the motor those smaller than 7½ hp. use a simple fused knife-switch and the larger ones require hand-operated auto-starters. When started from a distance an automatic starter is used of the resistor or auto-transformer type which gives thorough protection operating at high-efficiency at both speeds. Only a simple double-throw switch is required to change from one speed to the other. If the power source is limited or a speed reduction is at times desired, the wound-rotor type CW motor, with the same general mechanical characteristics as the type CS motor, is furnished. With this motor also, either hand-operated control at the motor or automatic control at a distance may be used.

UNDERGROUND PUMPING UNIT



UNDERGROUND PUMPING UNIT

Many mines have only direct current available; for these, type SK motors having the same, simple, strong, and reliable construction, steel frame, and rugged bearings are used. These motors are built self-starting as large as 20 hp., so that they may be thrown directly on the line from any desired point. For pumping from a sump, a float-switch in connection with an automatic controller will start and stop the motor at the desired limits. An especially handy outfit and an efficient arrangement of pumping equipment is obtained by mounting a motor-driven pump on a truck or mine-car. This will enable quick transportation of the pump to any desired point.

COMMERCIAL PARAGRAPHS

It has always been impossible, according to the **du Pont** company, to obtain a satisfactory covering for concentrating tables. In lieu of a better material, linoleum has been largely used, but the abrasive action of ore and, in the case of mine water containing sulphuric acid, the corrosive action soon destroys the linseed-oil content of linoleum and necessitates its frequent replacement. 'Minefab' is the name of a new material that has been specially developed to meet the requirements demanded of a table covering. A recent testing program, carried on simultaneously in a number of mining districts, proved conclusively that all objectives have been attained. Minefab will give longer and more efficient service than any other material. Minefab is made with a heavy fabric base, coated on both sides with an extremely tough, flexible, protective film of pyroxylin, which ruggedly resists abrasion and is highly immune to sulphuric acid. The coldest weather does not affect its flexibility, and it is absolutely water-proof. Being white in color, the contrast between it and the ore increases the opportunity of recovering a maximum of the metallic content from the sludge.

Zelnicker's Bulletin No. 250 of 84 pages contains long lists of second-hand machinery, such as rails, locomotives, cars, cranes, tanks, power-plants, machine-tools, wire rope, hoists, etc.

Camphuis, Rives & Gordon, Inc., exporters and importers, inform us that their New York office at 81 New street is now fully organized for this business. The president, W. D. Gordon, and secretary-treasurer, L. G. Unzueta, have been connected with this class of trade for 20 and 15 years, respectively.

The Waugh drill-steel punching-machine, model 110, is briefly described in Bulletin 10-V of the **Denver Rock Drill Manufacturing Co.** The machine will open the hole (in hollow steel) in a bit or shank in one-twentieth the time required to do this by hand. All gauges of steel can be handled without changing the dies.

Although Book No. 333 of the **Link-Belt Co.** of Chicago contains 88 pages on equipment for the handling and preparation of coal at the mine, metal companies will find therein a great deal of information, thoroughly illustrated. Besides the operation of conveyors, screens, chutes, rolls, silent-chain drives, and the 3-compartment car-dumps are described.

Manganese-steel sand and gravel pumps of large size are discussed in a new bulletin of the **American Manganese Steel Co.** of Chicago Heights, Illinois. When excavation is necessary, and there is plenty of water, the centrifugal pump is an economical efficient means for moving loose material. Cutter-heads of careful construction are important, also a rock-ejector in the suction-pipe. This firm makes special pipe, and renewable parts of manganese steel.

Steam mine hoists and accessories are illustrated and described in Bulletin 19 of the **Lidgerwood Manufacturing Co.** This is a well-prepared publication. The hoists shown are the single fixed-drum reversible gear type, single-friction drum, band-friction drum, incline haulage engine, double friction drum reversible, double tanden-friction drum, belt hoist, prospecting hoist, and other types. A few notes are given on cages, sheaves, buckets, and indicators.

The 'Giant' semi-Diesel fuel-oil engine is discussed by the **Chicago Pneumatic Tool Co.** in Bulletin 34-W. This engine is considered to differ from all others in its horizontal position, the use of a cross-head, and the use of a hot plate instead of a hot ball or electric ignition. A horizontal engine means easier accessibility. The crank is counter-balanced. Oil used may be any distillate of 28 to 40°B. Some crude oils can be used. All the parts are illustrated and described.

The **Green Engineering Co.** of East Chicago has issued a booklet on its 'materials transfer and storage-hopper', showing the stages in its construction. The supporting structure is built of standard steel sections, cut and punched ready for erection. After this, cast-iron plate supports are hooked to the angle struts of the steel frame, and into the recesses in the sides of these supports are slipped the cast-iron side plates and corner plates. The whole assembling requires no skilled labor.

'Superior' McCully crushers are described in Bulletin PM-50 of the **Worthington Pump & Machinery Corporation.** These machines are made by the Power & Mining Machinery Works of Cudahy, Wisconsin. Sectional views and list of parts makes the parts easily understood. Lubrication of eccentric and gear is a feature of this design. Chilled iron or manganese steel are used in the crushing head. Sizes manufactured vary from the laboratory crusher with each feed opening 2½ by 10 in. to No. 36 of 36 by 126 in. Some notes are given on revolving screens and elevators.

H. W. Clarke, who until December 15 has been connected with the advertising department of the McGraw-Hill Book Co. at Chicago, has been appointed manager of advertising for the **Chicago Pneumatic Tool Co.**, Chicago, Illinois. Mr. Clarke has been identified with the engineering advertising field for several years. Prior to his connection with the McGraw-Hill publications he was eight years with the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pennsylvania, part of the time as a member of the sales and publicity department and later as Western publicity representative with headquarters at Chicago.

Horace N. Trumbull, who recently received his discharge from the Engineers Officers' Training School at Camp A. A. Humphreys, Virginia, has been appointed advertising manager of the **Wellman-Seaver-Morgan Co.** of Cleveland, Ohio. Before entering the service he acted in a similar capacity for the SKF Ball Bearing Co. of Hartford, Connecticut. The Wellman-Seaver-Morgan Co. has opened a San Francisco office at 415 Rialto building, in charge of Norman S. Ross. Business originating from California, Nevada west of the 115th meridian, and the counties of Josephine, Jackson, and Klamath in Oregon, will receive the attention of Mr. Ross.

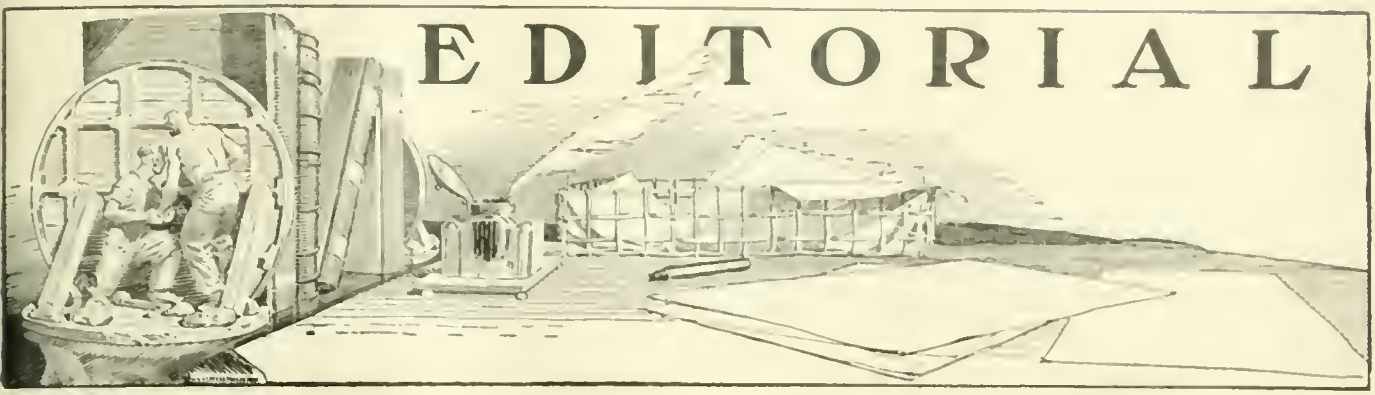
The **A. H. Simpson Co.** of 633 Stevenson street, San Francisco, has established a high prestige as dealers, purchasing and selling-agents in new and second-hand machinery of every description. Efforts have been directed toward the establishing of business along sound lines. Every piece of used equipment sold by them carries with it definite guarantees of what it will do. During the last year, when new machinery was hard to secure, many mines found the company a reliable clearing-house in which to get what they needed. A. H. Simpson and Irving Thyle are looking forward to greatly increased business during 1919. Their yards and warehouse are stocked with a large and varied line of both new and second-hand machinery. It will pay any mine manager or superintendent to consult them when in need of equipment.

Of unusual interest to mining men is the announcement that the well-known Congress, Alvarado, and Rincorn mills at Congress Junction, Arizona, are to be dismantled immediately. The Congress plant has been in operation only a short time and the machinery is said to be in perfect condition. **Rosenburg & Co.**, of Los Angeles, have purchased the entire plant, including the railroad, and will sell the equipment of all three mines. According to one of the officials of the company, nothing will be reserved and everything will be sold as rapidly as possible. Among the large list of materials to be disposed of will be 6 miles of standard-gauge, 45 and 55-lb. rails, 75 tons of 8 and 10-lb. re-laying rails, 100-stamp mill complete, railroad gondolas, donkey engines, hoists, air-compressors, 9 miles of riveted pipe, 3 miles of 4-in. standard pipe, 5 miles of other standard pipe, ore and timber cars, boilers, machine-shop equipment, including lathes, drill-presses, and planers, tanks, cable, pulleys, belting, pipe fittings, tools, etc. The Rosenburg company has already begun the dismantling of the mills and all of the goods are open to inspection at Congress Junction, Arizona.

Oxwelding and Cutting: Manual of Instruction. Pp. 124, ill., index. The Oxweld Acetylene Co., Chicago. Price, 50 cents.

The oxy-acetylene process, like so many other important innovations, has suffered from the belief that almost any one could use it successfully without instruction, while, as a matter of fact, the work requires highly-skilled labor with special training. The present volume aims to supply this instruction. After a brief and non-technical explanation of the various physical and chemical laws upon which work with the oxy-acetylene torch depends, the general subject of welding with the torch is considered. Next comes a discussion of the properties of the various metals that are welded. Then generators and other apparatus used in the work are considered. The remainder of the book is devoted to practical problems in welding and cutting—60 in all. The text is supplemented by a number of line drawings. Any one having to do with oxy-acetylene welding or cutting will find the book invaluable.

Oil production of the United States during 1918 amounted to 345,500,000 barrels. This is a gain of 3% over the output of 1917.



EDITORIAL

IN a recent issue we referred to Dr. Raymond as the son of an editor of the New York 'Times'; this was an error; he was editor of the 'Free Democrat', in 1852, and then, until 1854, of the 'Evening Chronicle', both newspapers published at Syracuse, New York. His father was also Professor of English in the Brooklyn Polytechnic Institute.

PRESIDENT POINCARE, in the speech that opened the proceedings of the Peace Conference, mentioned the fact that this meeting at Versailles began its work on the very same day—January 18—as that on which 48 years ago, at the same place, the German empire was proclaimed by a German army of invasion. Thus does "Time bring in his revenges".

AMONG the agencies established for aiding re-employment of those returning from the War, we may mention the Engineering Societies Employment Bureau at 29 West 39th street, New York. This bureau is under the management of the secretaries of the four engineering societies, namely, the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, and the American Institute of Electrical Engineers. Employers are invited to write to the Bureau and specify the type of men whom they desire to engage.

UNDER 'Discussion' this week we publish a number of interesting letters. Mr. R. T. Walker replies to Mr. G. A. Duncan, and contributes a scholarly account of legislation regulating the ownership of water in Nevada. It is a good-tempered and informing rejoinder. The Alaska Engineering Commission is defended by Mr. William Gerig. The chrome scandal and the pitchblende promotion are the subjects of two notes. Mr. Herbert T. Lacey suggests a corrective for the abnormal status of gold. To Mr. Arthur L. Pearse we are indebted for timely information on the oil-shale industry, with which he is in close touch. Finally, Mr. H. R. Chartran, recently in Siberia, writes to advise intervention.

HOW unrepentant the Germans remain is suggested by a recent public utterance of Dr. Alfred Zimmermann, the Foreign Minister whose Mexican scheming was one of the causes that drew this country into the War. Speaking for publication on January 16 he said that he feared other nations did not desire freedom of the seas and a league of nations "as much as Germany desires them because we want justice and protection from oppression." They want exactly what they refused to give to other nations, particularly those unable, like Belgium and Serbia, to withstand their depredations. He objected to the blockade maintained by the British navy as being against the law of nations, as if a German official could appeal to "the law of nations" without being ridiculous or impertinent, because the nation that attacked Belgium without warning under the blatant slogan of 'Necessity knows no law' outlawed itself by the act. Dr. Zimmermann also says that but for the blockade Germany "would perhaps have won the War." Then we say, thank God for the blockade!

WE note that a group of editors and publishers of American trade journals, recently on a visit of observation to the former battlefields of France, has sent a letter to President Wilson urging the punishment of the German leaders and agents responsible for acts "of piracy, murder, and pillage." This letter is signed by Mr. Horace M. Swetland of New York, the chairman of the delegation. We know Mr. Swetland well as an able, honorable, and enterprising publisher; we know him to be a man of kindly nature and broad sympathies; in short, he is well worthy of representing the enlightened public opinion of the United States. Therefore we feel respect for his stand in this matter and confidence in his judgment. He, in his representative capacity, insists that the devastation and ruin wrought by the German armies "are not the work of one man or a group of men" but "of a system, the policies of which have been executed with thoroughness by a willing people." He proceeds to emphasize the fact that "the laws of nations that civilization has so painfully built up through the centuries have been wantonly violated for four long years. To fail to enforce these laws now would be tacitly to concede the power of repeal by the criminals themselves. These laws must be re-established."

BOLSHEVISM, says President Poincare, is a microbe that attacks defeated countries, not victorious ones. It is a germ that finds lodgment in decaying organisms and feeds on ferment. Germany's bitterest pill is that her vaunted political and industrial organizations should have succumbed to the germ with which the German himself poisoned the illiterate Russian, proving that kultur, after all, was but a degenerate system. Bolshevism is thriving on the ruins of autocracy, but it threatens democracy quite as much. Most of our people are looking upon the Bolshevist campaign as if it were a Villa raid or a Yaqui uprising in Sonora: it is far more sinister than that. It is a formidable barrier to the successful issue of the Peace Conference and threatens the very basis of European civilization. As yet the Bolshevist campaign has gained no headway in this country, where it is identified properly with I. W. W. insanity, but if it prospers on the other side of the Atlantic it is sure to affect us also. If the old Russian term Nihilism were used as a synonym for Bolshevism, as it should be, we would recognize its tendencies more vividly. No more dangerous blunder can be made than to regard it as an extreme phase of Socialism; it is as opposed to Socialism as to any other scheme of organized and orderly society, it is distinctly anti-social, a reversion to the ape-and-tiger stage of human existence.

CONVICTION of 43 Industrial Workers of the World after trial at Sacramento brings before the public the seriousness of American bolshevism. Their "silent defence" was interrupted just before the Court pronounced judgment by an orgy of frothy oratory in the course of which several of the defendants defied the Government and the community that they had outraged. It is noteworthy that the Judge, wisely, we think, allowed them free scope for utterance, because the reckless expression of their anarchism is calculated to open the eyes of the public to the danger of their perverted ideas. The I. W. W. recognize no country; they respect no flag except the red one; they would pull down the structure of civilization on which centuries of human labor have been spent; they ignore the differences in men and would reward the stupid or incompetent equally with the wise and capable; they are the negation of human advancement. To them "the uniform of the United States soldier is the livery of the scab," so they seek to bring us to the level of Russia. They assert that "sabotage is a sign of courage," so they throw a bomb into a haystack and take great pains to be a hundred miles away before the bomb ignites. They try to undermine, degrade, or destroy the institutions of a country that to most of them has offered either an asylum of refuge or the chances of an honorable career. They are the bubonic rats of civilization, carrying with them the fleas of the political diseases from which this and other progressive countries try so hard to rid themselves. Bolshevism has brought eastern Europe to ruin; let us see to it that it gets no foothold on this continent.

ASHANTI is a name made familiar to some of us when we were boys by George Henty's story of 'The March to Koomassie', founded on the romance of Wolseley's campaign in the West African blackamoor country then called and spelled Ashantee. To our readers it will be interesting as the name of a great gold-mining enterprise, the Ashanti Goldfields Corporation. We make mention of it because it has just come 'of age', having been started in 1897. The first prospecting expedition to go into Ashanti arrived at Obuasi on Christmas Eve of that year. At that time Obuasi was a small village in an almost impenetrable jungle. Now it is a well organized town, with a population of 16,000, governed by a committee appointed jointly by the Government and the mining company. Bush-tracks have been superseded by a railway, the fever has been controlled by scientific sanitation, the natives have been taught many handicrafts, and the sun of civilization has pierced the miasma of the forest primeval. The mine is 124 miles from the coast and for five years everything had to be carried on the heads—not backs—of natives at an average cost of $300 per ton. Obuasi is now the seat of government for the Southern Province of Ashanti. All of this is well worthy of mention, but the original purpose of the white man's intrusion was to win gold. During the 21 years the Ashanti Corporation has produced £5,523,749, or $26,890,182 worth of gold, of which £1,867,014 or $9,055,018 has been net profit and 94.3% of it has gone into the pockets of the shareholders, leaving 5.7% to credit in the profit and loss account. For the success of its technical operations the company is indebted to Mr. W. R. Feldtmann, whose writings on cyanidation have made him known in this country.

ONE of our local organs of misinformation recently published an article on the Aurora Consolidated mines, in Nevada, and stated that an attempt to unwater this group of old mines had been dropped after spending a million dollars. The flood of water was so great, it was said, that the pumps had failed to lower the water-level. From this was drawn the major premise that gold mining is exceedingly hazardous, special emphasis being placed on "the essentially gambling nature of all mining." These mines, it was said, had produced ore that was "exceedingly rich," but all of it had been removed before they were abandoned by their former owners. The facts are these: the workings of the Aurora Consolidated were reached through an adit, so that all the water, only a few thousand gallons per day, gravitated into the storage-tanks at the mill. This supply of water from the mine was insufficient for the milling of the ore, so that it had to be supplemented by a spring two miles distant. The veins are big quartz-filled fissures in andesite. The quartz contains enough gold to bring it under the category of low-grade ore, the physical and economic conditions being favorable to cheap mining and milling. In consequence, the Goldfield Consolidated Mines Company acquired 87% of the 685,500 shares in the old company during 1913 and started to re-open the mines in June 1914, at which time it was estimated that a reserve of 600,000 tons of ore assaying $4.81 was available. The property, including a 500-ton mill, was valued at $877,000. During 1915 an output of 180,529 tons, averaging $4.14 per ton, was made, and from this a yield of $3.55

per ton was obtained, at a cost of $3.56 per ton, exclusive of interest, current construction, and royalties. In 1916 the output was 173,270 tons, averaging $3.32 per ton, from which $2.89 per ton was extracted at a cost of $2.46 per ton, showing a profit of 43 cents per ton. In 1917 the output was 175,447 tons, averaging $2.82, from which $2.32 was obtained at a cost of $2.42, showing a loss of 10 cents per ton. In 1918, up to September, the output was 104,086 tons, averaging $3.41 per ton, from which $2.83 was obtained at a cost of $3.48 per ton, showing a loss of 65 cents per ton. Evidently the rising rate of wages and the advancing price of supplies caused the curves of recovery and cost to cross each other during 1917, without any immediate prospect of a reversal of their fateful relations; therefore operations ceased in October 1918. These facts may be useful in days to come when the Aurora Consolidated again invites resuscitation.

The Peace Conference

Apparently the success of the Peace Conference depends upon an amicable adjustment of the claims of France for reparation as against the idealistic proposals embodied in the Fourteen Points, on which, as a basis for peace, the armistice was accepted by the principal belligerents. At the opening ceremony President Poincare took pains to emphasize the fact that he represented "a country which more than any other has endured the sufferings of war, of which entire provinces have been transformed into a vast battlefield and have been systematically laid waste by the invader. France has borne these enormous sacrifices although she has not the slightest responsibility for the frightful catastrophe that has overwhelmed the world." The French, naturally, want to be ensured against another such experience, they consider that they are entitled to the fullest measure of protection, at the expense of the beaten enemy; therefore Marshal Foch and others have suggested the Rhine as the natural barrier against German aggression. France says that England is protected by the Channel and America by the Atlantic, why then should she not avail herself of a natural barrier? France insists that she has twice felt the heel of the predatory German, whereas America knows nothing of the horrors of invasion and England suffered only from air-raids. "France," says Marshal Foch, "has a right to effective measures of protection after the formidable efforts she put forth to save civilization. The natural frontier which will protect civilization is the Rhine." This suggestion is incompatible with President Wilson's policy and is opposed to the understanding on which the German armies capitulated. To make the Rhine the north-eastern frontier of France and to compel Germany to cede all the rich and thickly populated region west of the river would be to create another Alsace-Lorraine, another festering sore in the body politic of Europe. England, however sympathetic with France in her sufferings through the War, will support the United States in objecting firmly to a settlement that would inevitably stimulate a war of revenge on the part of Germany as soon as she regained her strength, as undoubtedly she will. The Allies, and the Associate, have committed themselves to the doing of justice, which means reparation and restitution, but not depredation. It remains to reconcile these acutely divergent views. No league of nations can be founded on such an act as the partition of Germany and the annexation of the Rhineland; it would stultify all the idealism that President Wilson has endeavored so strenuously to inject into international politics. Moreover, as we have suggested in a previous issue, it is at least doubtful whether a river like the Rhine would prove an effective barrier to invasion, having regard to the possibilities of attack from the air and the rapidly increasing range of modern artillery. England, we believe, will be willing to pool her claim for indemnities, chiefly for air-raid damages and losses of shipping, with those of her Allies; she will not, we hope, present any such claim, for compensation for the cost of the war, as Mr. Lloyd George suggested in a reckless election speech. On the contrary, we feel confident that England will establish a good working agreement with the United States, looking to a settlement that will stand, not one that will sow the seed of another internecine struggle for world dominion. Even the 'freedom of the seas' will prove no source of friction as between the two English-speaking peoples, because England's trade depends upon giving to all nations a complete access to the sea, including the creation of 'corridors' for those physiographically detached from the water, such as Switzerland, and possibly Hungary. Undoubtedly Mr. George and the other British representatives see the splendid opportunity afforded at this time for establishing, not an alliance, but a friendly understanding between Great Britain and the United States. This ought to be one of the chief gains of the War to both countries, but it need not diminish the friendship either of France for England or of the United States for France; on the contrary, the Anglo-French *entente cordiale* should join with the historic Franco-American friendship in uniting the three great democracies for the safeguarding of civilization and the advancement of human progress. In that peaceful association lies the hope of the world, pending the day when nations will behave like good citizens and forego the appeal to arms every time either their honor is hurt or their business is menaced. If the individual will abate his assertiveness for the general good, and if we can compel him to do so when he refuses to behave, then the time must come when a recalcitrant nation will likewise be called to order by the superior power of social combination. It is not the least remarkable outcome of the recent European calamity that the anti-social instincts of the human brute should have asserted themselves at the very time when intelligent men are doing their utmost to curb the aggressive individualism of the nations by a pact for the establishment of mutually beneficial relations. The cosmic process, as Huxley pointed out, fights continually against the ethical process. The history of civilization is the construction of "an artificial world within the cosmos." Thinking man found it necessary for his own happiness to modify the cosmic process of animal evolution by the discipline of ethical principles. "The intelligence which has converted the brother of the wolf into the faithful guardian of the flock ought to be able to do something toward curbing the instincts of savagery in civilized man." So said Huxley. To this we may add that the intelligence that drove the Barbary pirates off the Mediterranean, that suppressed the slave-traders on the Atlantic, and that stultified duelling, will be competent not only to check German submarine piracy and the German attempt to enslave subject peoples but to compel Germany and every other nation to live in accord with the international laws that mankind has been trying, not without success, to establish for the benefit of all the countries of the world, whether small or large, whether poor or rich, whether weak or strong. As members of a family compelled to live on a small planet we have made a pitiful mess of our opportunities, we have behaved like the lawless members of a frontier community, we have acted like a mutinous crew in peril of shipwreck. It should be the aim of the fateful conference at Versailles to correct these blunders, not to make new ones nearly as bad; it should be the purpose of the delegates to act on the principle of 'Live and let live' within the bounds of the law.

The American Mining Congress

During the past week a Californian chapter of the American Mining Congress has been organized under the auspices of the California Metal Producers Association of San Francisco and the Chamber of Mines and Oil of Los Angeles. The meetings on January 15 and 16 in San Francisco proved an unqualified success, as was assured from the start because the affair had the whole-hearted backing of the best men in our mining community. A report of the proceedings appears on page 128 of this issue. In due course we hope to publish the text of the principal addresses, which dealt with subjects of national interest. Mr. Albert Burch, the chairman of the Metal Producers Association, presided over the sessions with conspicuous success, due in no small degree to the esteem with which he is held by the fraternity of Western mining men. The Congress in recent years has been fortunate in its presidents; Mr. Walter Douglas has been succeeded by Mr. Bulkeley Wells, who was present and added largely to the interest of the occasion by the appropriately prominent part he took in the discussions. Mr. J. F. Callbreath, the Secretary and chief organizer of the Congress, and to whom the success of its political activities at Washington are largely due, gave a most informing history of the organization, and, of course, took a guiding part in the business meetings. Our friends in the South were worthily represented by Messrs. G. M. Swindell, who acted as local secretary, and by Mr. T. A. O'Donnell, whose speech on the part that petroleum played in the War was the chief feature of the dinner on Wednesday evening. One consequence of the convention was the new start given to agitation in favor of creating a Federal Department of Mines with a Secretary in the Cabinet. The campaign for this purpose was launched in an eloquent address by Mr. John F. Davis, a distinguished lawyer not without experience of mining. We hope to publish this address at an early date. Another important utterance was that of Mr. Frank B. Anderson, the President of the Bank of California, who explained the attitude of bankers toward mining enterprise in a weighty speech that was heard with eager attention and that our readers will find stimulating to serious thought. This brief summary of the convention will indicate to those not present that the proceedings were well organized and unusually informing. One fact was unmistakable, namely, that this gathering of mine operators and mining engineers was thoroughly tired of being regulated, controlled, and disciplined by the halo-hatted gentlemen at Washington. While willing to submit to the unpleasantness during war-time, they were looking forward to their accustomed freedom of initiative. Every expression of protest against unnecessary regulation after the War elicited prompt approval and any reference to the necessity for giving the customary scope to individual effort evoked loud applause. This fact is one that sagacious politicians—not to mention statesmen—will not disregard, for we believe it to be no mere local manifestation of feeling. In this as in other matters the American Mining Congress is representative of the mining community in the nation. The experience of the War period has shown the mining community that it needs to be protected at Washington against ill-digested legislation, whether on the score of taxes and embargoes, or of regulations devised sometimes by persons in control of the market. The committees sent to the national capital to protest against sundry eccentricities of legislation have been assisted by Mr. Callbreath and his colleagues in a manner for which they have reason to feel grateful. Until recently the Mining Congress has been supported mainly by the small operators, but now the large companies have decided to co-operate. For instance, in Arizona the copper companies have agreed to contribute 10 cents per $1000 of annual production, the contribution being limited to a maximum of $6000 and a minimum of $60 per company. This financial assistance is given without representation on the board of management, so that there is no danger of the big interests exercising undue control. The vote is still restricted to individual membership. It is now proposed to enlarge the activities of the Mining Congress by organizing eight statistical and technical divisions, but we trust that the mistake of duplication already being made by the Geological Survey and the Bureau of Mines will not be imitated. If the Mining Congress should fail it will be by branching out unduly and trespassing on the preserves of the official agencies. We believe that the Mining Congress has a useful function to perform on behalf of the mining industry, and we trust that it will not endanger its effectiveness by undertaking to do too much.

DISCUSSION

Water Laws of Nevada

The Editor:

Sir—In your issue of December 21, there was published, under the caption of 'Water Laws of Nevada', a letter from Mr. G. A. Duncan relative to recent water litigation in the Eldorado Canyon mining district of southern Nevada, which he used as a text for criticism of the existing water laws of the State, concluding with a plea for corrective action at the approaching session of the legislature.

As the superintendent of the defendant company at the time the action referred to was tried, I desire an opportunity to reply, partly because the circumstances of the case have not been fully stated in Mr. Duncan's letter, and partly because I consider that the legislation urged by Mr. Duncan would be highly detrimental to the welfare of the mining industry of this State.

The case was rather unusual in several respects, and a brief summary of the salient features will be desirable to illuminate the legal point involved. The climate of the Eldorado Canyon district is very arid; the annual precipitation averages about six inches, and the surface-drainage channels retain water only briefly after the infrequent storms. The rocks of the district, which are entirely of igneous origin, are firm, hard, and practically impermeable, and the ground-water of the district, from which the permanent supply for mining, milling, and domestic purposes is obtained, is confined chiefly to three intersecting systems of post-mineral faults, which form a network of faults traversing the igneous complex. During the years 1915, 1916, and 1917, the effective precipitation (by which reference is made to storms of sufficient intensity to contribute to the stock of ground-water) was very small; and the result was promptly felt in a materially diminished flow of ground-water into all mine-workings throughout the district. The defendants, needing a supplementary supply of water for their cyanide mill, sank a shaft to intersect at some depth one of the strongest faults of the district, at a point where it crossed a deep gulch in the vicinity of their property; and their enterprise was rewarded by a considerable flow of water from the fault, when it was encountered by the shaft. A pumping-plant and pipe-line were installed, and the water was pumped to their mill, a mile and a half distant. The plaintiffs, whose property was situated about a mile down the same gulch, protested against the use of this water by the defendants, on the score that it was diminishing materially the amount of ground-water entering their mine, and which they used for milling purposes. The plaintiffs' orebody occurs in a porphyry dike, one wall of which is followed by a post-mineral fault, from which the ground-water entering their mine is largely supplied; and it was claimed by them that this dike with its accompanying fault passed through the "water-shaft", which the defendants had sunk, and that the latter, consequently, were intercepting ground-water that otherwise would eventually have reached the plaintiffs' mine by flowing along the subterranean conduit formed by the fault accompanying their "water-bearing dike". The defendants pointed out that, at several places in the intervening distance, the plaintiffs' 'water-bearing dike" was faulted for considerable distances by cross-faults of later age than the fault accompanying the dike, thereby interrupting any continuous channel that might once have existed; that, further, a pronounced difference in the chemical analyses of the water from the defendants' "water-shaft" and the water from the plaintiffs' mine, which could not reasonably be explained by chemical reactions in transit, pointed to the conclusion that there could be no immediate connection between the ground-water at the two places; and that, finally, the decrease in the amount of ground-water entering the plaintiffs' mine could reasonably be accounted for, in part by the prevailing drouth from the effects of which the entire district was suffering, and in part as the natural consequence of the depletion of the accumulation of ground-water in the vicinity of the plaintiffs' property, resulting from their several years constant pumping from their mine—a common and, in fact, almost universal experience in mining. The defendants further contended that the water, which they were pumping from their water-shaft, was "percolating water", under the definition of the term in the Nevada statutes, and as such appertained to the land upon which it was developed, and that title to it could not be claimed by outside parties. Nevertheless, the plaintiffs—fortified by a unique water-right, issued by the Nevada State Engineer, which granted them priority of use of the ground-water entering their mine from the "water-bearing dike"—brought suit to restrain the defendants from pumping water from their "water-shaft"; and the case was tried in 1917 before the Tenth District Court of Nevada. As the defendants were able to prove that they had not commenced pumping from their water-shaft until a number of weeks after the date established by the plaintiffs as the time when the decrease in their water supply first became noticeable, and as the defendants were further able to show that the total amount of water pumped by them was only a fraction of the total decrease in the plaintiffs' water supply, the plaintiffs were unable to establish any significant relationship between the decrease in their water supply and the action of the defendants in pumping from the water-shaft, and the case was decided against the plaintiffs for this reason; but no decision was rendered by the Court as to the validity of the water-right issued by the State Engineer, or in regard to the point as to whether water, flowing along a fault-plane, entirely enclosed in rock, is or is not 'percolating' water and as such not subject to appropriation under the Nevada laws.

The Nevada statutes provide that only water "flowing along a well-defined channel" in a definite and constant direction is subject to appropriation by means of a water-right; and previous interpretation of the phrase has confined the application of the law either to surface streams or to water permeating the gravel-filled channels of surface streams. While it is recognized that there is considerable movement of water in subterranean rock-enclosed channels, as is evidenced by the occurrence of springs issuing from hillsides and by existence of underground streams in limestone regions, the practical impossibility in most cases of determining the course of such streams has prevented any attempt to subject them to the application of the same laws which govern the disposition of the water of surface streams, and consequently they have been classified, in common with ground-water in a passive state, as 'percolating water', and as such have been held to be unsuitable for appropriation for purposes of individual usage by means of water-rights. It is Mr. Duncan's recommendation, I understand, that water moving along subterranean rock-enclosed conduits with somewhat definite boundaries, such as faults, fracture-zones, joints, bedding-planes, etc., be declared to occupy "well-defined channels" within the legal definition of the term, and as such be subject to appropriation in accordance with the usual procedure.

Before attempting to point out the inpracticability and danger of such a law, a brief consideration of the nature of ground-water is necessary. The commonly used expression of 'a sea of ground-water', which suggests the idea of complete saturation of the rocks below water-level and of rather free communicability of such water, is misleading. Some conglomerates and sandstones, volcanic agglomerates and tuffs, etc., are sufficiently porous to permit the free passage of water; but mining operations have demonstrated that most rocks both of sedimentary and igneous origin, are 'dry' when unfractured; that is to say, such water as they contain is so small in amount as not to produce the condition of moistness, and the majority of it is contained in openings of capillary or sub-capillary size, where it is immobilized by molecular attraction. The greater part of all mobile water, encountered in underground workings, is contained in faults, fracture-zones, slips, joints, and other cavities that have been produced in the rocks by dynamic action after their formation. The bulk of the ground-water is undoubtedly in a passive condition or in a state of circulation too slow to be measured by instruments.

From the preceding, the differences between surface-water systems and ground-water and the difficulty of applying the same laws to both are apparent. Surface-water systems may be considered chiefly in terms of two dimensions; but in the ground-water the third dimension is also of importance. Surface-water systems are always arborescent in plan, with well-defined trunk and branches; but ground-water systems, on the other hand, have no uniform type of arrangement, but are usually complexly net-like. In surface-water systems the direction of flow, which is dependent upon the topography, is readily perceptible, is always in a constant and definite direction, and is irreversible. Ground-water systems are governed chiefly by the geologic structure, and are influenced to a much less extent by the surface topography. Hence the latter affords no positive clue to the direction of movement of ground-water, which is usually entirely unpredictable except in a general way. The direction of movement of ground-water is also subject to deflection or reversal to a considerable extent, through the interposition of current geological forces or through human agencies. It is rarely possible to determine with certainty the natural direction of flow (if such has previously existed) of the ground-water encountered in underground workings, for the reason that any artificial excavation always profoundly modifies the subterranean drainage in that vicinity, new directions of flow toward the underground workings being instituted. Even the case where the water enters underground workings chiefly from one direction does not afford conclusive evidence that the previous flow of the ground-water was from that direction, since the same situation would result from the penetration of the underground workings into a subterranean accumulation of stationary ground-water, close to one boundary of the 'reservoir', so that the flow of water from one direction might soon terminate, but might continue from the other direction, in which the bulk of the accumulated water was situated, for so much longer a period as to create an illusory appearance of a natural flow in a constant direction.

In the case where ground-water is confined to a certain definite, constant, and readily identifiable formation, as is artesian-water basins, there are possibilities for the equitable apportionment of such water to consumers under State or National control; and there is a distinct tendency in this direction, in certain States, which appears worthy of encouragement, provided the proper limitations of such control are recognized and suitable safeguards against its abuse are provided. But where, as in most mining districts, the ground-water occurs in an inconceivably complex maze of faults, fissures, joints, fracture-zones, and erratic areas of permeable rocks, any attempt at a similar control of distribution would be attended with endless difficulties and certain to result in trouble. Most mineral veins contain water, and are so permeable that the removal of water at one point of the vein affects the water-level elsewhere along the vein. The first mining locator on such a vein, using the water therefrom for mining or milling purposes, and having taken out a water-right thereupon under the application of the law proposed by Mr. Duncan, would be able to prevent subsequent locators on other portions of the same vein, or on branch or cross-veins, from using the water for their own mining requirements, or might even enjoin the removal of any water, such as would be necessary for the prosecution of underground development, on the ground that it would deprive the original locator of water that he required for his operations and had appropriated for that purpose. In most mining districts, indeed, the ground-water of the whole district is, through the influence of communicating faults or veins, more or less affected by the operations of any single mine; and hence a mine, strategically located, might conceivably dominate an entire mining district, and either prohibit its development or place it under tribute. The opportunity that would be afforded for litigation and blackmail, under such conditions, is obvious.

A law of the nature recommended by Mr. Duncan, in fact, would practically amount to granting extra-lateral ground-water rights, and, as a legal sand-bag in the hands of the unscrupulous, would be a fit consort of the present apex law. Like the latter, it might seem to be required, in certain cases, to protect the original locator and to assure him the full rewards of his toil and enterprise; but the practical application of such a statute would soon demonstrate that it could be used as easily to defeat the ends of justice as to defend them, that it would prove a ready weapon for those who seek to profit by the labor of others and to reap where they have not sown, and that it would place a heavy tax on the mining industry in litigation and blackmail. Like many other refinements of procedure, exact and absolute justice usually costs more than it is worth: and for purposes of practical utility, it is best to have laws that are simple, plain, and common-sense, and which require no expensive legal machinery to interpret and apply them, even if it is necessary to sacrifice the interests of a few individuals for the sake of the general welfare. Therefore, in mining districts, at least, ground-water rights as well as mineral rights are, for practical working purposes, best confined to the ground included between vertical planes passing through the surface boundaries of the mining claims.

The Chrome Scandal

The Editor:

Sir—In your issue of December 28 Mr. Justice F. Grugan, chief engineer to the Suffern company here, states a typical case of grief resulting from mine development and machinery installation because of present conditions.

I make the suggestion that the Government buy and store at the mines such ores and mine-products as will result from such conditions as are referred to by Mr. Grugan. I am thinking not only of chromite but of manganese, these two being the best examples of malnutrition among the war-babies of the mining world. Fifty millions or more spent in hundreds of piled and labeled and branded U. S. ORE PILES would steady conditions not a little. Regulations for the gradual sale of such ore, in emergencies, could be made, but I think that a reserve of 500,000 tons of manganese ore and perhaps a tenth as much chromite would be a national asset equal to the gold back of a billion dollars worth of our paper money. It would certainly be of more value than some of the houses being constructed for projects that have stopped, although I am not criticizing such construction, as it is relieving someone.

Tens of thousands of tons of American-owned minerals were mined in foreign countries for patriotic and personal motives. Such stocks are usually in strong hands and need no aid, though logically entitled to it. Since returning from South America in November, I am shocked to note that Government officials and the Government are often referred to as something apart from ourselves. Is it not up to us to make our public servants see what is for the greatest good to the most—miners?

New York, January 3.

Alaskan Engineering Commission

The Editor:

Sir—In your issue of November 9 there appears a letter from Henry Legin, of Talkeetna, Alaska, charging the Alaskan Engineering Commission, which is building the Government railroad from Seward to Fairbanks, with pro-Germanism. The article declares that the Commission, in hiring labor, discriminates against loyal Americans, and gives preference to alien-enemy Germans and Austrians, draft-slacker Swedes, and other disloyal foreigners. This accusation, ostensibly, is based by the person making it on what purports to be his observation and experience in the Talkeetna district, where, in at least one camp, No. 221, he says "all Americans were fired, to be replaced by aliens."

This charge of Mr. Legin was brought to the attention of the Alaskan Engineering Commission last fall, and was found to be false, and he was invited to the head offices of the Commission at Anchorage. In a talk with me he admitted his charge was based on misinformation, and he made the same admission to the Anchorage Council of National Defense. Mr. Legin had been led and encouraged into making his baseless charge by personal grievances of his own and a few other persons against one or two of the employing officials of the Commission in the Talkeetna district. Also as he is very excitable and French, many things were said in his presence in jest, which he took as the truth.

The Alaskan Engineering Commission is, and always has been, loyal to the core. One of the former members of the Commission and hundreds of its former employees are now in the United States Army in France. No pro-German, if his sentiments were known, could hold a job with us for a minute. Every division and every district has supported in the most praiseworthy manner every one of the war activities of the Government. And of all the districts, one of the best records in these war activities has been made by Talkeetna. Its subscriptions to Liberty bonds, and its donations to Red Cross and military hospital funds, exceed, considering the number of employees, all the districts. I enclose the figures now available relative to subscriptions to Liberty bonds, donations to the Red Cross, the Washington Hospital for Wounded Soldiers at Neuilly, France, and to the Department of Interior War Relief Association. Of course, there were donations to many other causes, such as Syrian and Armenian Relief, care of French and Belgian orphans, food and clothing for destitute Serbians, etc., but no record at all of these was kept. In the figures available you can see that the employees of the Commission always subscribed more than their allotment of bonds and were generous in all their various donations and that the employees in the Talkeetna district subscribed or donated a higher average for every war activity than the employees of the division. Their loyalty, like that of all workers in the Government Railroad, cannot be subjected to honest criticism.

William Gerig,

Anchorage, December 16. Engineer in Charge.

[We take much pleasure in publishing this letter. The accompanying tabulated statement shows that the employees in the Talkeetna district averaged $144.84 per man to the Fourth Liberty Loan, $8.10 to the Red Cross drive, and $5.79 (in 1917 and 1918) to the Neuilly bed.—Editor.]

Radium in Fluorspar

The Editor:

Sir—After many years of sleeping, the old camp of Jamestown, in Colorado, has awakened, and the reason is radium. Although originally a gold-mining community Jamestown has for some months past been devoting its whole attention to fluorspar. This spar was mined mainly by lessors and sold to the nearest mill. The mill crushed the ore and ran it over tables, taking out most of the silica and making, besides the fluorspar, a gold-silver-lead-iron concentrate.

At one of these mills, the Golden Age, a black streak was noted above the lead streak on the tables. This indicated the presence of some material of a higher specific gravity than lead and in all probability a rare metal. This material was taken to the laboratory for a 100% analysis. Various tests were tried and it was believed to be one of the platinum group of metals, as it came down as the general group precipitate. It failed to give any results, however, on separate tests for the individual members of the group, and it was soluble in simple acid, proving it not to be platinum itself. The fact that it was uranium in the form of pitchblende was finally determined. The Curie photographic experiment was then performed and a picture of a lead key obtained, showing radio-activity.

The uranium content of the crude ore is from 0.12 to 0.2% and the amount of radium is proportional to that of the uranium. When the uranium is concentrated up to 2% it is worth $3 per pound; to 3%, $4.50 per pound, and to 10%, $6 per pound.

Pitchblende does not occur in all the fluorspar of the district, and where it does occur it is in the spotted formation so typical of Boulder county. There is about two square miles of territory in this vicinity covered with fluorspar, but I doubt if one-tenth of it contains pitchblende. However, rare-metal experts consider this a great find and an unlimited amount of investment capital is pouring into the district.

Richard G. Place.

Pasadena, California, December 28.

[We referred to the wildcatting of the Colorado Pitchblende Company in our issue of December 28. The discovery is most interesting, but the public should be extremely careful in placing their money in such schemes. —Editor.]

The Status of Gold

The Editor:

Sir—I have read the letters appearing in your paper concerning the present-day gold question, and have obtained therefrom much information, but it seemed to me that in some of them, the most profound and erudite of them all, the chief point of the whole question was missed, resulting in a hopeless confusion of ideas and tending to paralyze all efforts to remedy the difficulty.

Soon after the War started in 1914 the banks made a show of slipping a few gold-notes into currency paid over the counter, but every recipient of such payments knew instinctively that he could not on demand get it all, or even a considerable part, in gold or gold-notes. I noticed this at Washington, and out of curiosity wrote to a broker in New York to see if he could get me a small sum in gold or gold-notes. His reply was in the negative. The simple fact was the country was no longer on a gold basis, although the custom of paying out a little in gold-notes was continued for a considerable period.

Then followed the period of tremendous imports of gold, on which in a vague and uncertain sort of way was predicated an immense expansion of credits and currency, but still there was no gold paid out, and there was no definite or published relation between the gold and the credit expansion as a whole. As a result of the expansion and the insistent demand, labor and many commodities advanced 100 and even 200%. On top of this situation came the entry of the U. S. into the War. Gold imports ceased, and all thought of any relation between our huge expanding credits and gold was lost sight of completely. The transition from a precautionary suspension of the gold basis, or payments, at the beginning of the War to a real and necessary suspension through an excessive expansion of credits took place so gradually that hardly a thought was given to it.

It is worth while to narrate these well-known facts merely to show that we are not on a gold basis, and have not been since 1914, although during much of the time the suspension was purely voluntary and precautionary. The letters which have been referred to as being obscure and confusing ignore this fact. The writers of them, in an unconscious effort to reconcile a double standard, namely, a gold standard and a paper-currency standard (medium of exchange), naturally fall into confusion. There is no harm in the paper-currency basis so long as it is frankly recognized, and preparations are made accordingly. The people have faith in themselves and in the country and in the banks and in the Government, and therefore have faith in the currency, but it is not gold. It will probably be several years before the currency bears the same relation to gold that it did previous to July 1914.

When one admits the facts in regard to present-day currency the gold question becomes a perfectly simple one to understand, for it is then seen that gold at present is a commodity like everything else. When embargoes against gold shipments are raised, and Government control of foreign exchange ceases it will soon be seen whether gold is worth $20 an ounce or $40 an ounce in the accepted 'medium of exchange' or 'standard of value,' that is to say, in our present-day currency. It is clear, however, that these forces cannot operate to determine the value of gold in terms of our present-day currency if and so long as our Government pays it out freely across the counter at $20.67 per ounce.

The situation is one that should be regarded with equanimity by gold miners and gold-mine owners. It is a case where the other man will 'do the walking.' Embargoes on gold shipments and control of foreign exchanges must be given up before international trade is resumed on a considerable scale, and gold cannot be commandeered in times of peace. Furthermore it is not likely that the Government will give up to a hungry world any large part of its stores of gold for less than a fair equivalent in value.

The following is suggested as a temporary expedient to bridge over the period of transition to the new order of things financial: Let the Government, through the Federal banks, name from time to time, as advisable, prices at which it is willing either to buy or to sell both gold and silver, thus fixing prices to exporters and importers, and to miners. The first prices could be arrived at by a consideration of the prices of commodities and labor, and thereafter by experience and by the state of foreign exchange. Under such a plan it would be impossible to use gold as money (except as token money, as silver is used today), but the Government could hold gold reserves against the currency, the proportion of reserve to be stated from time to time. When the financial affairs of the world have settled down and become stable it would be but a step to the resumption of a gold standard and gold payments.

Herbert D. Lacey.

New York, December 31, 1918.

Oil-Shale

The Editor:

Sir—From time to time you have published interesting notes on the prospective oil-shale industry, dealing principally with the geology, extent, and mode of occurrence of the potential beds in Colorado, Utah, and Wyoming. Two years ago this industry was in its beginning and very little was really known of it; it is now growing rapidly.

The facts regarding the position of well-oil production and reserves are becoming known and the need for supplementing the output of oil is being appreciated. The method of handling shale is better understood and the certainty that it can be a highly profitable industry is clearer. The wild-cat element, so vicious a few months ago, is moribund, investigations are showing more clearly the real status of the shale deposits both from scientific and economic standpoints, and a solid basis is being established. This appeals to investors. Many people and companies are making serious investigations and enquiries.

The simplest form of the industry means the production of high-grade gasoline, lubricating oil, paraffine-wax, ammonium sulphate, and a residue which it is claimed has value as a rubber filler and binder for briquettes, for the Colorado shale is gilsonitic. All these products have a ready market; one of the pressing needs today is lubricating oil, while the other products speak for themselves. I deprecate much some of the statements that are circulated even now, claiming shale as the best basis for dyes, explosives, and a long list of medicines and salts; this is not true, for all such can better be obtained from carbonaceous material and more cheaply. The prime products from shale above mentioned are enough in themselves.

The treatment of shale is an old industry; both in France and Scotland. It has been successfully done for a century and it is quite well understood. As applied to Colorado it involves: mining, and mining too of a high class; coal mining most closely approximates it; shale however lends itself better to the long-wall system and the plentiful use of high explosives is to be preferred, which is not the case with coal, and it should consequently be more cheaply mined. One hears of steam-shovel schemes, and perhaps, but solely for the reason that it will be possible to work low-grade or mixed shale economically, which hitherto has been difficult.

The shale has to be crushed finely; in the Scotch system it is reduced to two inches; in others and the most modern plants it is broken to one-quarter inch. Shale is tough and hard to reduce and special machines will be required.

The retorting is the most difficult operation; it is the crux of the treatment. The Scottish system has been successful. It has made good, but present-day requirements are much advanced. There are more retorts in Scotland today than shale to supply them and no retort improvements have been called for. The carbonization of coal in various forms of retorts, especially the continuous vertical, has led to much improvement in the art, for such undoubtedly it is. One prime object is a better arrangement to drive the heat-units to the centre of the charge or otherwise cook the molecule of coal or shale, and the other is better care of the gas immediately after it has been evolved. Mass carbonization has disadvantages, for as the heat passes from the wall of the retort the very act of carbonization sets up a heat screen. The carbonized material is a good non-conductor and the greater the thickness of the material the more costly does the heat become, and then the gas evolved in a mass of material has either to stagger its way out through temperatures that either involve 'cracking' it or it is condensed and falls back again for re-evolution at its critical temperature.

Much time and work have been spent on this question, both here and in England, where the work of treating hydrocarbon materials is being fostered by both the Government and private enterprise, with a large degree of success. It is possible to say that the latest form of retort deals effectively with the two points I have mentioned; it is comparatively inexpensive, will handle most forms of hydrocarbon material effectively, including shale, for which it was primarily designed; it has a large output, from one to three tons per hour; it is flexible, easy of access and repair, and as the carbonization is good and the gas drawn off nearly as and when evolved, the quantity and quality of the products are the best yet. From what I know of it, I expect it will be the most useful form of retort for reducing the sulphur contents of some of the shales.

The condensation of the gas and watery vapor is simple and either of the well-known systems are good according to circumstances and the water-supply. This condensation results in oil, ammoniacal liquor, and a certain amount of uncondensed gas. This last will be 'scrubbed' for its ammonia and light oil, leaving a non-condensable scrubbed gas that is to be used in heating the retort, apropos of which I would say that a well-balanced plant should produce enough of this gas for all the heating requirements. Hence no extraneous fuel is required.

The refining of the oil presents too many angles for me to discuss, except to remark that an acceptable proposal is to take off the natural gasoline, crack the gas-oil and lighter fractions, and refine the rest for lubricants and wax. The residue, if the shale is good and if it has been properly retorted, will be small, but still of some value as before-mentioned—again we have to depend on the proper retorting.

It will be understood, of course, that all these notes refer to low-temperature carbonization, a high temperature or one mid-high would produce a totally different series of products of less value and more costly. The results of the treatment of an average Colorado shale yielding a barrel of oil per ton of shale and carrying 0.5% of nitrogen, should be 16 to 18 gal. of gasoline, 16 to 18 gal. of lubricating oil, 16 lb. of paraffine-wax, and 25 lb. ammonium sulphate. Of course, Colorado shale, like every other shale, varies in different strata, both in its yield of oil and of ammonia. I know of shale that will yield 65 gal. over considerable areas and I have seen analyses showing over 1.15% of nitrogen. I have taken the figures for yield as representing what I believe will be the practice from a general average of many tests over large areas.

It is easy to figure out the value of the above products: today's prices would show a return of $9 per ton or more. The costs will vary according to economics, location, and the tonnage treated. On the basis of a 1000-ton plant with railroad facilities, water, and sulphuric acid at $18 per ton, and the shale mined and delivered to the plant for $1 per ton, including depreciation and all overhead charges, the cost will not exceed $4 to $4.25 per ton, which figure is based on actual cost elsewhere adjusted to local conditions. With the erection of large plants many improvements are bound to be introduced, so that any change is likely to be downward, even including labor, which surely cannot be worse than it is; but after making all allowances, there is still a good margin for the venture.

A word of warning: some people have thought that if they had a good area of good shale it was enough; there are other conditions just as important, such as plenty of water, dump-room, cheap acid, and, last but not least, good railroad facilities. Present knowledge on the subject has only come through years of patient and sometimes disappointing work. There is much to be solved in every locality, and many adjustments will be necessary. It is a difficult art and one too that requires a large investment of money, but if properly handled it has proved itself elsewhere the basis for a sound remunerative industry.

ARTHUR L. PEARSE.

New York, January 6.

Russia

The Editor:

Sir—I have just read in your issue of December 28, a very interesting article on Russia. Coming myself from the Lena goldfield where I prospected for two years, having also been in Irkutsk during the revolution, and seeing how anarchy reigns everywhere, I realize how absolutely necessary it is for the Allies to send forces to fight Bolshevism and Germans. American and French papers contain articles stating that Russia will get along without us. Such a policy is simply to leave Russia wide open to the Germans, who swarm there under Russian names.

May your magazine take an active part in the matter and do as much propaganda as possible to have the Allies make that country a decent place in which to work and live.

H. R. CHARTRAN.

Winthrop, California, January 1.

GRAVEL on Potato creek, Seward Peninsula, Alaska, carries cassiterite (black tin); and Moran creek, a tributary of the Molozi river, has gravel containing 2½ lb. of tin and 10 cents of gold to the cubic yard.

Mr. Roosevelt at Oxford

From the MINING and Scientific PRESS of July 9, 1910

By T. A. RICKARD

On Tuesday, June 7, Mr. Theodore Roosevelt delivered the Romanes lecture at Oxford University. It is an event so significant and so interesting as to warrant description even in a technical journal. I was privileged to be present and enjoyed the episode so greatly that I venture to record my impressions.

A week earlier Mr. Roosevelt had received the freedom of the City of London and no sooner had he been made a burgess than he exercised the right of citizenship by offering counsel to the British administrators in Egypt. It was a magnificent indiscretion, but a friendly act. After a year spent in Africa, in four spheres of British rule, he was well fitted to give both intelligent praise and salutary warning. He was as generous in emphasizing the beneficence of the work the British are doing in the Sudan, East Africa, and Uganda as he was outspoken in condemning the Egyptian nationalists who "treat assassination as a corner-stone of government" and the officials who are timorous in extinguishing violence, for "of all broken reeds, sentimentality is the most broken reed on which righteousness can lean." Fortunately his criticisms were well received. Englishmen have a sense of humor, not too evident, but it does save the day occasionally. Moreover, the administration of Egypt is now under the control of a Liberal government, hence the Conservatives, with their daily press and their social influence, were tickled to hear strictures upon the policy of their opponents and amused to see Roosevelt, under providence, embarrass those in authority. If the Government of the day had been Tory, the speech at the Guildhall would have proved less palatable, for instance, at Oxford, where the Chancellor, Lord Curzon, was able to refer to it approvingly and even gleefully.

The American ex-President himself was amused at the sensation caused by his speech in the City and did not scruple to refer to the "engaging frankness" of it. This was at the luncheon given in his honor by the American Club just before the Romanes lecture. The Club is composed of Rhodes scholars and other American students in residence at Oxford. The chairman was F. P. Griffiths, who made an admirable speech, in the course of which he dropped the particularly apt remark: "Good sermons are rare." He referred, of course, to the lay sermons on sociology delivered by the guest of the occasion. Mr. Roosevelt does indeed sermonize, but with what tremendous effect! Ordinarily the sermon in church is delivered by a man whose opinion on the weather we would scarcely value, but the preaching of Roosevelt is that of a man who has done things, a governor of men, a hunter of lions, a foe of corruption, and a prophet of good.

He responded to the chairman's speech and to the enthusiastic welcome of those present by making a few happy observations, chiefly in appreciation of the Rhodes gift and the hospitality of Oxford to American students. He speaks with extreme slowness, and clearly; he has a good voice, tending to hoarseness; he is emphatic, with an accent that a Britisher calls American and a Bostonian would term Philadelphian. When speaking he has neither the cultivated ease nor the oratorical charm that mark the best American speakers, but the slowness and distinctness of his utterance are decidedly impressive as evincing deliberate thought and strong conviction.

The Romanes lecture was founded twenty years ago by J. G. Romanes, a biologist, who desired to see instituted at Oxford a lectureship similar in kind to that of the Rede foundation at Cambridge. The founder insisted that the lecturers should be selected irrespective of nationality, and that neither politics nor religion should be made a part of the subject-matter. The first lecture was delivered by Gladstone in 1892, the second by Huxley in 1893, the third by Weismann. Last year the lecturer was Arthur J. Balfour. An honorarium of £25 is paid to each lecturer. Gladstone modestly called his address 'An Academic Sketch', but it culminated in a magnificent burst of eloquence and concluded with the words that are near every Oxford man's heart: *Dominus illuminatio mea*. The 'Evolution and Ethics' of Huxley was one of his finest expositions of the development of civilization amid the welter of the struggle for existence and it illustrated the illuminating quality of a highly trained scientific imagination when applied to the profoundest problems of existence. In many ways this lecture was a superb preface to Roosevelt's, although it would be unfair to compare the latter's treatment of his subject with that of the greatest expositor of the nineteenth century. Yet Huxley would have appreciated Roosevelt, for he, too, had an intensely virile strain; intellectually he repeatedly proved the possession of an essential manliness, strong to meet the blows of fate and circumstance, and a self-mastery as striking, and far more touching, than that of the Colonel of Rough Riders. The last words of the second Romanes lecture were curiously in accord with Rooseveltian sentiment, for Huxley said:

"'We are grown men, and must play the man, strong in will
To strive, to seek, to find, and not to yield.'

cherishing the good that falls in our way, and
bearing the evil, in and around us, with stout

hearts set on diminishing it. So far, we all may
strive in one faith towards one hope:
'It may be that the gulfs will wash us down,
It may be we shall touch the Happy Isles,
...... but something ere the end,
Some work of noble note may yet be done'."

Roosevelt at Oxford! The association of names provokes a contrast between the old and the new, between ideas and ideals so unlike that the difference excites humor, between the romantic and the practical, between thought and action. It was delicious to think of the Strenuous One lecturing the dons of the university, to hear the Rough Rider in the home of ecclesiastic romance, to see the ex-President of the United States facing the ex-Viceroy of India.

It happened to be a lovely summer day, smiling in sunshine, dropping the tear of a shower only to freshen the wealth of flowers, shrubs, and trees that softens the architectural beauty of the long line of noble colleges. "Beautiful city! so venerable, so lovely, so unravaged by the fierce intellectual life of our century, so serene!" No wonder Matthew Arnold wrote rapturously concerning "the home of lost causes and forsaken beliefs, of unpopular names and impossible loyalties." Her ineffable charm is as potent, nay more, in this restless era of telegraphs and telephones, of motorists and airmen, than fifty years ago when Arnold thus apostrophized her. She still "whispers the last enchantments of the Middle Ages," but she is no longer withdrawn from the flowing river of the nation's intellectual life; on the contrary, to Oxford largely is given the task of training the rulers of empire. She may not be an incubator for engineers nor a nursery for financiers, but pre-eminently it is her task to train the men who become pro-consuls and administrators, the just and wise rulers over those alien races that live in peace under the British flag. Selborne, Milner, and Curzon typify the Oxford product. The noble traditions, the philosophic teaching, the aristocratic *milieu*, the historic associations, the reality of greatness, all afford fit environment wherein to teach young Englishmen to act worthily as the representatives of a dominant race when exercising imperial sway; but it may well be questioned whether Oxford affords the atmosphere in which to educate the leaders of a democracy, even under the shelter of a limited monarchy. Of social snobbery there is none worth mentioning, the students take rank on their merits as men, they work and they play under ideal conditions; the bank balance does not count; they discover that life is good if you know how to live it; they are happy! The learning is disinterested, for no commercial purpose is in view; the play is not made a business, it is just enjoyed for itself. Oxford is not a training-ship nor a hot-house; youth learns to live and to think there. Her windows are Gothic but through them is seen the wide world of today.

The Romanes lecture is always delivered in the Sheldonian theatre, which was the first public building designed by Sir Christopher Wren, the architect of St. Paul's cathedral. In this university theatre the Duke of Wellington was installed as Chancellor, amid great enthusiasm, in 1833; here Disraeli declared: "I prefer to be on the side of the Angels." Here, in the previous century, Handel conducted the performance of his oratorio 'Athalia'. It is not a large building and it was full to overflowing long before the proceedings began. The audience numbered about four thousand. In the galleries were the undergraduates, in the side aisles were such of the general public as had been fortunate enough to secure tickets, and the floor of the theatre was wholly occupied by graduates, wearing gowns with their distinctive hoods; the white ermine of the Bachelor of Arts and the magenta satin of the Master of Arts. Facing the entrance was the 'throne' of the Chancellor and below him were two curving tiers of seats left vacant for the learned doctors who would come in procession escorting the distinguished man about to be numbered with them.

At three o'clock the academic procession entered. Through the window I could see them leave the School of Divinity, where they robed and where they had performed the formalities preliminary to conferring an honorary degree. They crossed the short space between the two buildings and entered the theatre, led by the marshal, followed by the bedels, with their rods of office, the Chancellor of the University (Lord Curzon of Kedleston), the Vice-Chancellor, the heads of Colleges, and then a long line of doctors in scarlet hoods, among whom I recognized Andrew Lang and Rudyard Kipling. The two representatives of Oxford in Parliament (Sir William Anson and Lord Hugh Cecil) had already taken their seats. The train of the gorgeous robes worn by the Chancellor was borne by a younger son of the Earl of Selborne, recently High Commissioner in South Africa.

The audience being technically seated, although hundreds stood for lack of accommodation, the Chancellor addressed the Convocation in Latin, asking them if it were their pleasure that the honorary degree of Doctor of Civil Law be conferred on "the Honorable Theodore Roosevelt, ex-President of the United States of North America, and that the long-expected Romanes lecture may be delivered by him, etc." Cries of '*placet*' followed. Whereupon the bedels were sent to bring the honorable gentleman, and the Chancellor turned to the Vice-Chancellor and said, in Latin, what can be freely translated thus:

"Behold, Vice-Chancellor, the promised wight
Before whose coming comets turned to flight,
And all the startled mouths of sevenfold Nile took fright!"

The audience laughed appreciatively, and as Mr. Roosevelt entered a mighty burst of applause greeted him. Walking to the foot of the steps leading to the Chancellor's chair, he halted, and was addressed (still in Latin) by Henry Goudy, the Regius Professor of Civil Law. In a felicitous speech, heard only by those that were near, the orator referred to the principal events of Roosevelt's life, especially how "with unrivaled energy and tenacity of purpose he had combined lofty ideals with a sincere devotion to the practical needs not only of his fellow-countrymen, but of humanity at large." This presentation speech being ended, the Chancellor spoke; and at the first word there was a roar of laughter, for he said: "*Strenuissime, insignissime civium toto urbe terrae hodie agentium.*" And the Most Strenuous One enjoyed it, as he did the references that followed, especially the "*hominum domitor, beluarum ubique vastator.*" This short speech ended with the words that conferred the degree. The recipient allowed himself to be robed in a scarlet gown, and then shook hands with the Chancellor. The latter directed the bedels to conduct "the honorable Doctor to the lectern," whereupon Roosevelt, amid further applause, took his place, ready to begin the lecture.

Before he began, however, he had to listen to another speech, this time in English, by the Chancellor. Lord Curzon, a tall and imposing figure in gorgeous gilded robes, stood facing him. It was worth coming a long way to see these two men *vis à vis*, each playing a great part in an impressive performance. Curzon spoke excellently, in cultivated accents, easily, with a touch of humor, an obvious friendliness, and with the superb confidence of a practised orator addressing a chosen audience. The nobleman, the statesman, the ex-Viceroy of India paid his compliments to the citizen, the leader of the greatest democracy in history, the ex-President of the United States, and it must be confessed that the phrasing was worthy of both men. It thrilled me through and through that so fine an appreciation could be uttered, and yet be true. The Chancellor said that he had just had the pleasure of addressing Mr. Roosevelt in a language which, of course, he would recognize as the habitual medium of intellectual intercourse in the university to which they now both belonged. It now fell to him to say a few words of welcome to Dr. Roosevelt, in a language of which in its most picturesque and forcible idioms he was an acknowledged master. The invitation to deliver the Romanes lecture had served as a nucleus around which had been built "that wonderful progress of his through the countries of Europe, a triumphal progress such as had been enjoyed but by few even among conquerors and kings." He then went on to say: "And yet I doubt whether in all the countries he has visited Mr. Roosevelt has anywhere received a warmer welcome than that which has been given him in this ancient seat of learning, for we greet him not merely as a great ruler of men, the most conspicuous figure in America's history since Abraham Lincoln, not simply as a sincere and outspoken friend of his country, though from all his utterances we knew that he was, but also as a student of many forms of knowledge, a writer of books, a fearless preacher of robust and manly faith, a relentless foe of conventions and shams, and, above all things, in all that he says and does he is what Browning said of Clive, 'pre-eminently a man'."

It may be that the Chancellor was a trifle too facetious; at least some of the audience thought so, but I confess to having enjoyed his witty touches, because they gave relief to the general tone of handsome eulogy. It was a delightful speech, delivered perfectly.

All the while the subject of it stood quietly at the lectern, with his sheets of manuscript ready to read. An astonishingly young-looking man, not within ten years of his real age. A head covered with short thick ruddy brown hair and a stalwart figure, he looked anything but academic. The back of his head seemed that of a man in the thirties and belligerent in every line of it: not domed, but flat on top: it bespoke action rather than contemplation. Obviously he was in splendid health and brim-full of vitality. When Gladstone delivered the Romanes lecture he was 83, Huxley was 68, Roosevelt was 52. Such physical well-being is a great factor in the career of a political reformer. Roosevelt is pre-eminently the eupeptic hero of our day: May he outlive all his enemies!

When he began to deliver the lecture his accent was strongly marked. Perhaps a touch of nervousness affected his enunciation; as he proceeded this defect was less evident, although in some words the pronunciation was persistently provincial, by which I mean that he did not speak the English language as it is spoken by the most cultivated Americans, for instance, at his alma mater, Harvard. Whether life in the West or association with politicians in the East of America be the cause, the fact remains that Mr. Roosevelt speaks English with an accent no purer than that of many Britishers. However, this detail is not material. It was lost in the broad effect.

The subject was 'Biological Analogies in History.' He began with a graceful compliment to local associations and to memories that "are living realities in the minds of scores of thousands of men who have never seen" Oxford. Such associations, he said, "are no stronger in the men of English stock than in those who are not. My people have been for eight generations in America, but in one thing I am like the Americans of tomorrow rather than like the Americans of today, for I have in my veins the blood of men who came from many different European races." This reference to his own "ethnic make-up" and to that of his fellow countrymen was apt; it enabled him to emphasize an understanding sympathy superior to biological antecedents. Loud applause punctuated the statement that ended the introduction when he said: "Common heirship in the things of the spirit makes a closer bond than common heirship in the things of the body."

Next he discoursed on the study of history, laying stress on the necessity for treating such a study not only as a science but as literature. "We need a literature of science that shall not only be read but shall be readable." Many of those present must have thought of the great biologist who delivered the second Romanes lecture and who in the work of his life illustrated to perfection the application of literary treatment to scientific knowledge. I wondered why Roosevelt omitted the chance to refer to Huxley. He proceeded to point out that the proper study of mankind is man in a biological sense and that the historian must avail himself of "the science of evolution, which is inseparably connected with the great name of Darwin." He confessed himself as impressed by the parallelism between the cycles of animal life and those of national life; but not without a warning against false analogies. "As knowledge increases our wisdom is often turned into foolishness." Terms must be defined lest we fall into the error of hasty generalization. We talk of a 'new species', yet no living thing can really belong to a new species. Similarly, the 'extinction of species' may mean either of two things: that the species has literally died out; or that it has so changed as to be no longer recognizable.

Then followed a sketch of the biological history of South America. As soon as the southern continent became joined, by the elevation of the isthmus, with the northern regions, the animals of North America passed over the land bridge and invaded South America. A riot of life ensued. The conquering type developed enormous bulk and complete armor protection. The indigenous creatures that survived also grew in size and power according to their needs. Events such as these are matched in the history of man. Nations go under and disappear; others survive and are regenerated into a 'new' nation, in which the remnants of the old are perpetuated.

In this first portion of his address Mr. Roosevelt discussed fundamental biological principles without saying anything new. Remembering Huxley's lecture on 'Evolution and Ethics,' remembering that in biology Roosevelt was the veriest amateur, I felt that he was on the edge of a fiasco, and the feeling oppressed me keenly. But when he got off this treacherous ground and began to touch on matter in which he could show a clearer insight, I realized that the early part of the lecture laid the foundation for what was to follow. He drew analogies between the fate befalling the forms of animal life and the destiny of the great artificial civilizations, such as Babylon and Nineveh, Greece and Rome. "The growth of soft luxury, after it has reached a certain point, becomes a national danger patent to all. If the homely commonplace virtues die out, if strength of character vanishes in graceful self-indulgence, then the nation has lost what no material prosperity can offset." There he struck a characteristic chord. Holland furnished another example. "Her fatal weakness was that so common in rich peace-loving societies, where men hate to think of war as possible, and try to justify their own reluctance to face it either by high-sounding moral platitudes or else by a philosophy of short-sighted materialism." But Holland and Italy taught us how races that fall may rise again. "When the Roman Empire went down in ruin, it was one of the greatest cataclysms of history, but it was not all mere destruction. Not only did Rome leave a vast heritage of language, culture, law, ideas to all the modern world, but the people of Italy kept the old blood as the chief strain in their veins. In a few centuries came a wonderful new birth of Italy." Italy rose and fell again, more than once. Spain and Portugal also had their day. "Their flowering time was as brief as it was wonderful. When the first brilliant period of the leadership of the Iberian peoples was drawing to a close, at the other end of Europe, in the land of the melancholy steppe and forest, the Slav turned in his troubled sleep and stretched out his hand to grasp dominion."

The memories of men are short and the supremacy of races is brief. "More than a century passed after the voyages of Columbus before the mastery of war began to pass from the Asiatic to the European." Then "the European advance gathered momentum, until at the present time peoples of European blood hold dominion over all America and Australia and the islands of the sea, over most of Africa, and the major half of Asia." The various nations of Europe in turn sought "a place in the movement of expansion, but for the last three centuries the great phenomenon of mankind has been the growth of the English-speaking peoples and their spread over the world's waste spaces."

Here he entered the third phase of the lecture; he now held the sympathy of his audience and frequent applause punctuated his speech. Unfortunately so much time had been given to the preliminaries and to his own introductory observations that, realizing the inadequacy of time, he began to discard sheets of typewritten manuscript without reading them. As the newspapers had received advance copies of the lecture several weeks earlier, the reporters had an easy task and the frequent rustling of leaves as they followed his utterances indicated the omission of long paragraphs. Another result followed, for the evening papers, and even some of those appearing next morning, quoted portions of the lecture omitted by the lecturer and offered comment on matters of which he had not spoken. He held the sheets in his left hand and used his right for an occasional gesture, raising his hand with the index finger erect to emphasize a point. But there were no oratorical flourishes; he spoke as a man careless of everything except the desire to convince.

Thus he came to the comparison between Britain and Rome, and between the British empire and the American democracy. "England has peopled continents with her children, has swayed the destinies of teeming myriads of alien races, has ruled ancient monarchies, and wrested from all comers the right to the world's waste spaces, while at home she has held her own before nations each of military power comparable to Rome at her zenith." Rome fell by attack from without, because of domestic ills. He pushed the analogy: "We should be vigilant against foes from without, yet we need never really fear them so long as we safeguard ourselves against the enemies within our own households; and those enemies are our own passions and follies." Americans and Englishmen alike must keep in mind that the success of a great democracy depends on self-knowledge and self-mastery. "In the last analysis the all-important factor in national greatness is national character." What was to be our destiny? Were we as nations soon "to come under the rule of that great law of death which is itself but part of the law of life"? None could tell. The growth of luxury, the love of ease, the taste for vapid and frivolous excitement were both evident and unhealthy. The ominous sign was the decline in the birth-rate. But "no man is more apt to be mistaken than the prophet of evil." It was "strange indeed to look back at Carlyle's prophecies, and then think of the teeming life of achievement, the life of conquest of every kind, and of noble effort crowned by success which has been ours for the two generations since Carlyle complained to High Heaven that all the tales had been told and all the songs sung, and that all the deeds really worth doing had been done." Come what might we belonged to people "who have not yielded to the craven fear of being great." Moreover, while freely admitting all the follies and weaknesses of our day, it is yet mere perversity to refuse to realize the incredible advance that has been made in ethical standards. He was no pessimist. He had scant patience with "the silly cynicism which insisted that kindliness of character only accompanies weakness of character." On the contrary, he held that "rugged strength and courage would go hand in hand with a lofty scorn of doing wrong to others." Each nation had problems of its own and must solve them in its own fashion, in a spirit of broad humanity, free from weakness and sentimentality. "As in war to pardon the coward was to do cruel wrong to the brave man whose life his cowardice jeopardized, so in civil affairs it was revolting to every principle of justice to give to the lazy, the vicious, or even the feeble or dull-witted, a reward which was really the robbery of what braver, wiser, abler men had earned." In dealing with social problems "the one prime necessity was to remember that though hardness of heart is a great evil, it is no greater an evil than softness of head." Each man was entitled to be treated on his worth as a man. "To more than such just treatment no man is entitled, and less than such just treatment no man should receive." Thus he harped on that noble string from which the American makes the sweetest music known to humanity.

He spoke at length in this strain and I select from his concluding remarks the following sentences: "The only effective way to help any man is to help him to help himself; and the worst lesson to teach him is that he can be permanently helped at the expense of some one else. True liberty shows itself to best advantage in protecting the rights of others, and especially of minorities. Privilege should not be tolerated because it is to the advantage of a minority; nor yet because it is to the advantage of a majority. No doctrinaire theories of vested rights or freedom of contract can stand in the way of cutting out abuses from the body politic. Just as little can we afford to follow the doctrinaires of an impossible—and incidentally of a highly undesirable—social revolution, which in destroying individual rights—including property rights—and the family would destroy the two chief agents in the advance of mankind, and the two chief reasons why either the advance or the preservation of mankind is worth while."

When he finished, the theatre resounded with hearty applause. The audience had listened with the closest attention; contrary to precedent, even the undergraduates in the gallery had forborn to chaff; it was evident that the academic gathering was deeply touched, sympathetically appreciative, and finally heartily enthusiastic. In its strong points, as in its weak ones; in its general tone of outspoken virility, unsophisticated reasoning, and cheerful optimism, the lecture was representative of the lay sermonizing for which the lecturer is now famous. He spoke as one who reads the classics in the intervals of lion-hunting, and studies history while fighting monopolies. He is as downright as he is upright, as broad in his ideas as he is deep in his convictions. It may be that his sayings do not apply the stimulus of novelty to a cultivated mind, but the same may be said of many lectures delivered at Oxford, and elsewhere. He makes plain things obvious and gives a new life to platitudes. He dresses the eternal verities in the garments of his own manly sincerity so that they seem endowed with the freshness of a new day instead of the staleness of forgotten ideas. He came to Oxford a man on horseback, a Rough Rider in a cathedral, a practical man among scholars, a radical among reactionaries, but he left it vibrating to the glad optimism, sound common-sense, and inspiring invocation of his thoughtful utterances. He forged another golden link between the two English-speaking peoples and proved indeed that "common heirship in the things of the spirit makes a closer bond than common heirship in the things of the body."

Gold and Silver Production in 1918

The Bureau of the Mint and the U. S. Geological Survey have issued the following joint preliminary estimate of the production of gold and silver in the United States during the calendar year 1918:

	Gold		Silver	
State or territory	Fine oz.	Value	Fine oz.	Value*
Alaska	440,622	$9,108,500	796,836	$796,836
Alabama	36	700	2	2
Arizona	278,647	5,760,200	6,771,490	6,771,490
California	832,389	17,207,000	1,555,417	1,555,417
Colorado	621,791	12,853,500	6,982,313	6,982,313
Georgia	169	3,500	41	41
Idaho	30,764	636,000	10,188,056	10,188,056
Illinois	......	....	8,939	8,939
Maryland	......	....	164	164
Michigan	......	....	491,939	491,939
Missouri	10	200	40,948	40,948
Montana	153,375	3,170,600	15,341,793	15,341,793
Nevada	322,276	6,662,000	10,113,405	10,113,405
New Mexico	30,871	638,200	763,758	763,758
North Carolina	38	800	9	9
Oregon	60,951	1,260,000	150,207	150,207
Philippine Islands	44,202	913,700	12,597	12,597
South Dakota	328,305	6,786,700	165,865	165,865
Tennessee	263	5,400	131,931	131,931
Texas	5	100	612,436	612,436
Utah	152,018	3,142,500	13,439,811	13,439,811
Vermont	47	800	5,117	5,117
Virginia	20	400	2,967	2,967
Washington	16,556	342,300	302,446	302,446
Wyoming	18	400	719	719
	3,313,373	$68,493,500	67,879,206	$67,879,206

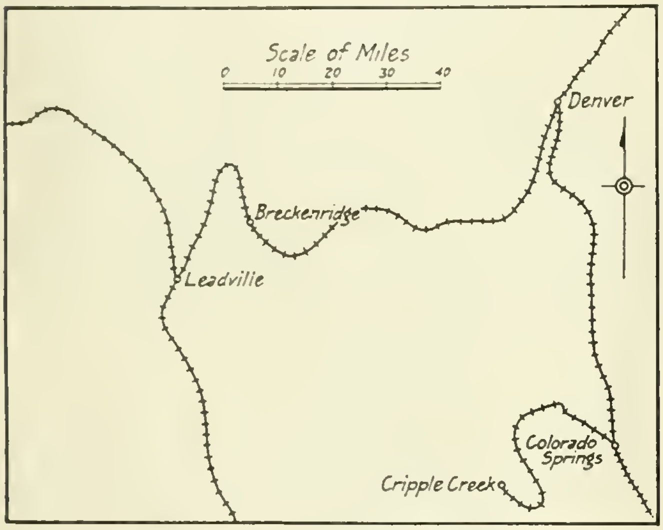
*Valued at the Government buying price of $1 per ounce

These figures, compared with those showing the production in 1917—gold, $83,750,700; silver, 71,740,362 oz. —indicate a reduction in the output of gold of $15,257,200 and in that of silver of 3,861,156 oz. The output of gold in 1918 was the smallest in 20 years and that of silver was the lowest since 1913.

Topography and Geology of Dredging Areas—III

By CHARLES JANIN

COLORADO. *The principal dredging areas in Colorado are near Breckenridge, in Summit county, where the gravel occupies the bottoms of existing valleys. The greatest known thickness, about 90 ft., is near the Gold Pan pit at Breckenridge.† Along French creek the depth to bedrock in the main channel, from Nigger gulch down, is 45 to 50 ft. Along the Blue river, between Braddocks and the mouth of the Swan, the depth in the old channel is 55 to 60 ft., and along the Swan, from Galena gulch down, the maximum thickness is 40 to 50 ft. The width of the gravel-filled valley bottoms is 600 to 3000 ft. along the Blue, 500 to 1200 ft. along the Swan, and 700 to 1500 ft. in French gulch.

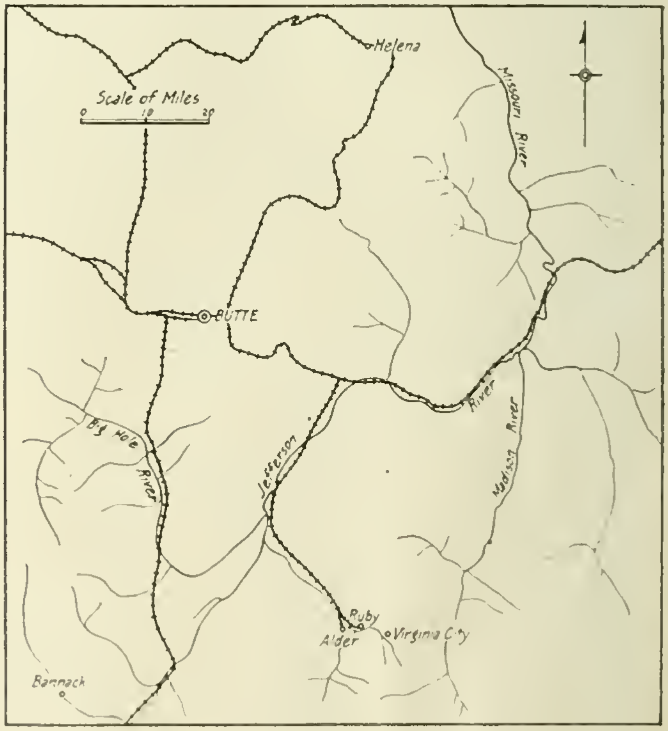


THE COLORADO DREDGES ARE NEAR BRECKINRIDGE AND LEADVILLE

In general, the gravels are loose and the readiness with which they crumble when undercut by the buckets facilitates dredging. Those on the lower Swan cave more easily than those on French creek. The gravels are generally coarse and contain hard well-rounded boulders. Along the Blue these boulders range in diameter from a maximum of about 6 ft. near Breckenridge to 4 ft. near Valdoro. In French gulch the large boulders rarely exceed 3 ft. in greatest diameter and are not so well rounded as those on the Blue. On the Swan, below Galena gulch, the gravel is more uniform and contains fewer large boulders than that along the Blue or in French gulch. Drilling and dredging show that the rock-bottoms of the channels are smooth as a whole, but at a few places where the streams have cut into quartzite the auriferous surface of the bedrock is rough and hard enough to tax the dredge machinery severely. Shales generally are so soft as to be easily excavated by the buckets; and the porphyries, owing to more or less decomposition, also constitute a tractable bottom material.

MONTANA. The most important dredging operations in Montana are on Alder creek, in Madison county, at Ruby. In fact, this is the only field, except for early work at Bannack, where gold dredging has been successful in this State.

Alder creek rises on the northern slopes of Old Baldy mountain, at the south end of the Tobacco Root mountains, and flows north-west in an irregular curve to the Ruby river at Laurin. The prevailing rocks in the Tobacco Root range are schist and gneiss, with limestone and quartzite in places. The auriferous gravels at Ruby lie on volcanic ash beds that form a smooth false bedrock that shows only gentle undulations and slopes regularly to the west. In the gulch itself occasional spurs of the true or original bedrock are struck in dredging and are in part responsible for some of the ensuing repairs.



THE ONLY DREDGING IN MONTANA IS AT RUBY

Auriferous gravel extends at least 16 miles along Alder gulch, but the area known to be profitable for

---

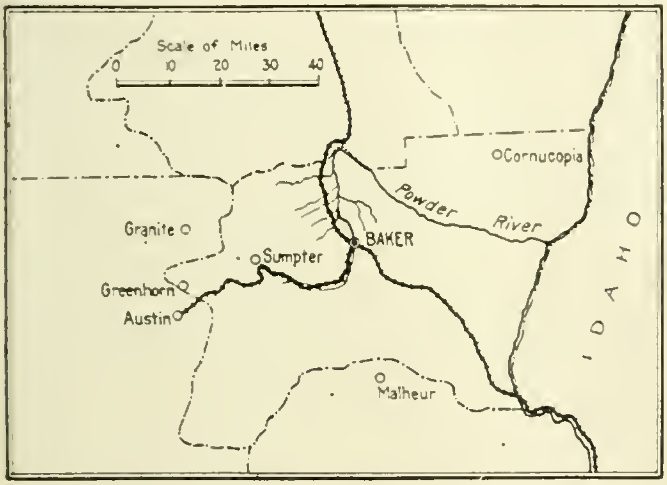
*Abstract from Bull. 127, U. S. Bureau of Mines.

†Ransome, F. L., 'Geology and Ore Deposits of the Breckenridge District, Colorado': U. S. Geol. Survey Prof. Paper 75, 1911, 187 pp.

dredging is probably only about six or seven miles long, and contains about 1750 acres of proved dredging ground.

Although not as cemented nor as hard as the hardest ground in the Oroville district or the deep gravel at Folsom, the gravel has a clay matrix that makes it rather tenacious, especially near the false bedrock. The gold grains vary in coarseness, the average size increasing up the gulch. In the dredging ground 40 to 50% of the gold passes a 60-mesh screen, and 15 to 30% passes a 100-mesh screen. The gold varies in fineness also, that from the dredge farthest up the gulch running about 0.836 fine and that from the lowest dredge, about two miles below, being about 0.873 fine.

Idaho and Oregon. In Idaho the placer deposits are largely confined to the large area of deeply eroded granite in the central part of the State. Most of the placer gold has been derived from the gold-bearing quartz veins with which the districts are invariably ribbed.‡ The most important placer district in Idaho is Boise Basin, where the Boston & Idaho Dredging Co. has been at work a number of years.

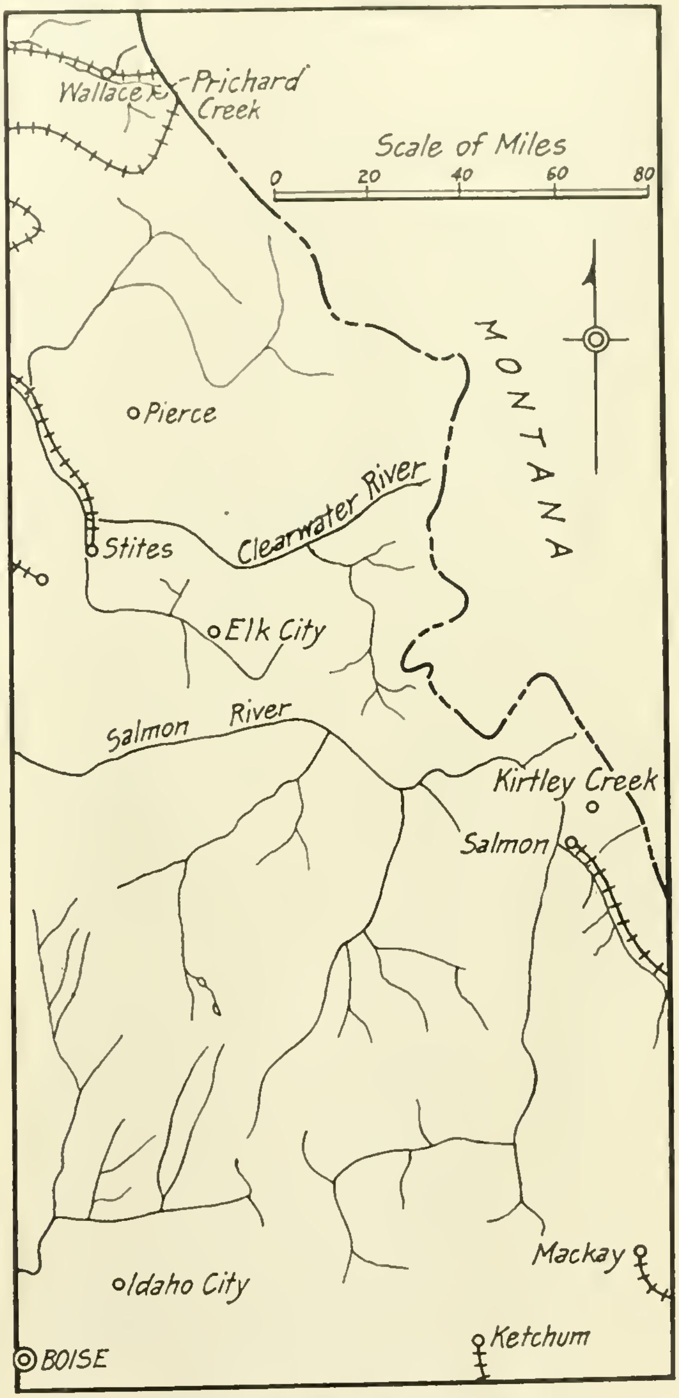


IN OREGON, DREDGING IS LIMITED TO THE POWDER RIVER DISTRICT

In this basin, the ground is light and easily handled; the gravel is about 30 ft. deep; and at times a dredging face 1300 ft. wide has been carried. Before dredging started there had been extensive hydraulic mining in the vicinity and much of the material handled by the dredges is tailing from the old workings. The dredges usually work through the year, but on account of severe weather they shut down in January and February, 1915. There is a great deal of sand in the ground and it is often necessary to run the top material dry through the screens.

Other dredging operations in Idaho have been carried on at Kirtley Creek and Bohannan Bar near Salmon City, in Lemhi county, and minor operations at Moose creek, also in Lemhi county; Pierce City, in Clearwater county; and at Elk City.

In Oregon the only profitable dredging enterprise as yet developed is that of the Powder River Dredging Co. near Sumpter. The Powder river drains the richest mineral district in eastern Oregon. The ground may be characterized as a medium-size dredging gravel, being somewhat larger than the average Californian gravel and containing some large boulders. It is 12 to 25 ft. deep, the average depth being about 16 ft. and 300 to 1500 ft. wide. A few ledges of hard country rock are occasionally encountered. The gold content is mostly in the lower beds and on or near the soft decomposed bedrock, which is known to the dredgemen as 'clay webfoot.'



DREDGING IN IDAHO IS MAINLY NEAR IDAHO CITY. A NEW BOAT IS WORKING ON PRICHARD CREEK IN THE COEUR D'ALENE. ELK CITY, KIRTLEY CREEK, PIERCE, AND SALMON HAVE BEEN DREDGING AREAS.

---

‡Bell, R. N., State Inspector of Mines, Boise, Idaho.

The Position of Copper

By CHARLES HAYDEN

The following interesting review by Mr. Hayden, of Hayden, Stone & Co., appeared recently in the New York 'Times'.

This is one of the most interesting times in the copper situation that one can imagine. Starting with the beginning of the world war in 1914, which, due to the interruption of the commerce of peace, led to a general demoralization in this country financially and commercially, and which compelled a curtailment of production at the copper mines to about 50% of normal, we have seen the demands of war cause a steady increase of production up to the point of forcing the same, so that the mines of this country during the last year universally pushed production to the limit.

Although the demand for copper for actual consumption in manufactures was still at its height last spring and summer, a peculiar series of events occurred which are now making themselves felt, at least temporarily, in a most marked way. By reason of the exceedingly cold weather around New Year's a year ago and the difficulties of transportation due to the heavy war-manufacturing business and other reasons, although copper was being outputted from the mines at an enormous rate, the refineries, owing to delays in transportation, were not running at nearly full capacity, as the blister copper was not arriving at the refineries from the West. The summer months, because of the intense heat, are always months of low output in a copper refinery. Then early this fall came the Gillespie explosion close to the refineries, which demoralized the situation for a week. After that came the Spanish influenza, which, coupled with the labor difficulties the entire year due to the high wages paid by the shipyards and the acute labor shortage, has meant that regardless of output from the mines the refineries have not been able to refine all of their product, so that a very substantial accumulation of unrefined copper was on hand when the armistice came.

While this copper could easily have been delivered had it been refined as produced, there is now naturally a let-up in the commercial demand, due to the readjustment which we are going through from a war basis to a peace basis. Immediately after luncheon one does not eat another meal, but one is invariably hungry by dinner-time, and so we should be unreasonable were we to expect a big consumptive demand for copper at the moment. But that is no reason for the producers to be stampeded and think there is never going to be a demand again, for as soon as the reconstruction which accompanies peace begins a very substantial demand will again spring up. And in the meantime the copper companies are all very strong in cash and cash assets, and there is no more reason why they should not carry a substantial amount of copper than there is that a dry goods company should not always have a substantial stock of goods in its store.

While costs remain high the consumer must expect the price of copper to remain up, as it is certainly not to the interest of the country at large, whose natural resources should be conserved, nor to the interest of the stockholders of the companies, that their copper, which is their principal, should be depleted by being taken out of the ground without profit.

Now as to a few statistics of the last year. It is undoubtedly true that this fall the amount of unrefined copper in process between the mine and the market was some 400,000,000 lb. greater than it was on January 1, 1914, and that accumulation is due to the conditions previously mentioned. The stock of refined copper, of course, has not only not increased since January 1, 1918, but actually decreased and is substantially smaller than it has been any year since the War began. The production for the year 1918 (December estimated) was about 2,400,000,000 lb. It is estimated that the consumption was 2,300,000,000 pounds.

As previously stated, the production does not mean the amount of copper refined, but what is mined from the properties, and the excess of production over consumption is not fully measured by the increased stock on hand. There is no doubt that while the stock of copper in process in this country is larger than in former times, it is also a fact of equal importance that the large stocks which were formerly carried all over Europe, not only in warehouses, but in transit and in the plants of consumers, do not now exist. What stocks there are in Europe today are all practically in the hands of the governments under their control and are relatively small compared to previous times.

It may be interesting to look back to the conditions existing in the first half of 1914. At that time consumption and production were about equal, namely, 140,000,000 lb. per month, and that production was consumed about as follows:

	Pounds per month
Germany and Austria	46,000,000
England	14,000,000
France	14,000,000
Italy	4,000,000
Other European countries	2,000,000
Total Europe	80,000,000
United States	60,000,000
Grand total	140,000,000

For the 10 to 15 years preceding the War, both production and consumption showed a steady average increase from year to year of about 7%, and had there been no war a continuation of this increase would have given us a consumption at the present time of about 190,000,000 lb. per month, whereas consumption has been during 1918 about 200,000,000 lb. per month. But as I expect production from now on will be substantially less than 190,000,000 lb. per month, it is very evident that consumption will very quickly outrun the reduced production, so that next spring there will undoubtedly be necessary another increase in production.

The Smelting and Refining of Cobalt Silver Ore

By SYDNEY B. WRIGHT

*The ore received at the Deloro Reduction Co.'s works from the shippers of the Cobalt and Gowganda districts, consists of silver-cobalt ore in lump form, jig and table concentrate, and residues such as those produced by the Nipissing Mining Co. and the Mining Corporation.

For sampling purposes the ore is ball-milled to about a 20-mesh product, a 14% cut being drawn by a Snyder disc-machine as the bulk sample. After a second Snyder cut, the sample, now constituting about 2% of the original ore, is transferred to the sampling-floor, where after thorough mixing it is coned and quartered into two samples that are then quartered down separately.

Reserve samples of these original pulps are sealed and retained for umpire purposes, until settlement has been made for the shipment. The control-samples are ground to pass a 100-mesh screen, scales being separated as usual for assay purposes. The requisite number of assay-samples is drawn for the shipper, smelter, and independent assayer, the certificate of the last governs in settlement for the shipment.

Metallics or nuggets are removed from the ball-mill after the carload or lot has been crushed, and are melted down to base bullion in an oil-fired crucible-furnace. The silver content as shown by assay, is added to the total silver contained in the milled pulp, and settlement made accordingly.

After the ore is sampled it is transferred to bins, from which it is charged to the blast-furnace. The charge is so calculated as to furnish a practically neutral slag and, on account of the large quantity of fine present, the furnace is run generally at a blast-pressure of only 6 to 8 oz. It was considered probable that by briquetting the fine the capacity of the furnace would be increased, but the test-runs made on these lines did not produce the desired metallurgical results. The ore, and reverts from other sections of the plant, are therefore mixed wet and charged to the furnace in the form of a stiff mortar; this sinters fairly well before the smelting zone is reached, the actual flue-dust produced amounting to about 6% of the ore and slime charged. The products of the smelting operation are speiss (from which a quantity of base silver is liquated in the case of high-grade runs) slag, and arsenic fume, which is collected in bag-houses of the regular type.

The speiss produced contains approximately:

	%
Co	22 to 25
Ni	16 to 18
As	25
Fe	18
S	7
Cu	1
Ag	1000 to 1200 oz. per ton

This speiss product is ground in a ball-mill until the whole passes a 10-mesh screen. The ground material is then roasted until it contains only 10% of arsenic. The roasting is done in a furnace of the reverberatory type equipped with a mechanical rabble having water-cooled arms. The chloridizing is done in a Bruckner cylinder.

The chloridized speiss is washed with water and then agitated for one hour with a cyanide solution containing the equivalent of 20 lb. KCN per ton. The silver is precipitated from the solutions by means of aluminum dust, one part of which deposits about eight parts of silver in our practice. In is interesting to note that the cyanide actually regenerated in this precipitation is practically equal to the theoretical quantity formerly present in the double silver salt.

The precipitate now goes to the silver refinery and the desilverized speiss residues to the oxide plant.

The base silver, liquated in the form of bottoms from pots of speiss, averages about 800 fine, the balance consisting of arsenic and antimony, with some cobalt, nickel, iron, copper, and bismuth.

This bullion is refined by melting it in an oil-fired Schwartz furnace, which is equipped as a small converter. As soon as the charge is in a molten state the furnace is tilted backward into blowing position and the metal is blown for about three hours. During the first half-hour of this period the oil is shut off from the burner, the heat of the reaction being sufficient to keep the metal molten for that length of time. After a short further heating up the charge is poured into ingot molds.

The silver bullion thus obtained averages from 992 to 995 fine, and is brought up to commercial grade (996 and better) by re-melting with silver precipitate from the cyanide plant; this operation is performed in a second Schwartz furnace. The gases from these furnaces are drawn through coolers and passed to a small bag-house. The fume is rich in silver, carrying about 800 oz. per ton, and consists essentially of arsenious oxide with some antimony and bismuth oxides. All bullion-slags and this fume are eventually re-charged to the blast-furnace.

The gases from the blast-furnaces, the roasters, and chloridizers are drawn through flues and coolers before reaching the bag-houses, which collect the crude arsenious oxide. The temperature of the gases entering the bag-houses is regulated at a maximum of 250 F. by means of a thermostat operating a damper in the main flue; when the temperature rises to 250 F. cool air is immediately drawn in, reducing the temperature.

The crude arsenic collected in the bag-houses is sent to refining furnaces, which are coke-fired reverberatory-hearths. The arsenious oxide is volatilized and con-

---

*Abstracted from the Canadian Mining Institute Bulletin, December 1918.

densed in chambers that are emptied at intervals of ten to fourteen days. The products from these chambers are pulverized and packed in barrels by means of a Raymond pulverizer, a system that certainly deserves the admiration and gratitude of the packer and his employer when handling such materials as arsenious oxide.

The clinker or slag drawn from the refining-hearth contains all the silver that was formerly present in the crude arsenic; this slag goes back to the blast-furnace.

It is necessary now to return to the de-silverized speiss residue, which contains the cobalt and nickel of the ore. The metals in this material are present principally in the form of oxides, so the first treatment is that of sulphatizing in order to render the cobalt and nickel soluble as sulphates. The sulphatized speiss is charged to vats in which the mass is agitated with hot water and the sulphates dissolved. The liquors thus obtained are then freed from copper and iron before passed to the precipitation vats, first freeing them from the copper and iron contained.

The cobalt and nickel are separated by fractional precipitation with hypochlorite solutions, the nickel being finally precipitated as hydroxide by means of milk of lime. The hydroxides of cobalt and nickel thus obtained are filter-pressed, washed, and dried, after which treatment the oxides are either pulverized and packed for the market, or are transferred to the metals department for reduction to the metallic state.

For the purpose of reducing the oxides they are mixed with charcoal and reduced to rough metal in oil-fired furnaces. After separation from excess carbon by means of a magnetic separator, the rough metal is melted in electric furnaces and converted into shot form by pouring into water. The 50-kw. electric furnaces used are of the single-phase, top and bottom electrode type, lined with magnesite, and have a capacity of 100 lb. of cobalt or nickel metal per hour.

TUNGSTEN ORE sent from Hongkong to America during the first nine months of 1918 was 3323 tons, valued at $2,852,913. In October the exports rose to 1265 tons. The United States Consul General at Hongkong, writing on November 7, states that the fall in price of the ore in America, apparently due to unusual supplies and an overstocked market, has resulted in a reduction of the output of the Chinese mines, and there is likely to be more or less irregularity of production until the situation in the consuming countries resolves itself into a more stable condition. Local mining engineers, however, are of the opinion that whatever may be the situation in the United States, China will be called upon for all the tungsten it can produce, for the simple reason that under normal conditions and notwithstanding the Chinese government 'military' tax of $15 per picul of 133⅓ lb. (which works out to about $25 in actual practice), the ore can be produced more cheaply in this field than in any other part of the world. A fall in the exchange-value of silver to a more ordinary level will reduce materially the cost of production of the ore in terms of gold. It is thought, therefore, that there is a great future for the trade despite the uncertainty of the present moment. Exports to Europe continue at about the volume that has moved so far during 1918, but the bulk of the exports have been to the United States.

Copper Output

Production of copper in the United States during 1918 was slightly in excess of the output of the mines during the previous year, according to advance figures on the year's tonnage given out by the U. S. Geological Survey. At an average price of 24.75 cents per pound the production of the mines was $473,000,000, compared with $510,000,000 in 1917 and $190,000,000 in 1913.

These figures represent the actual output of the companies for the first 11 months of the year and the estimated output for December. Production of blister and Lake copper from domestic ores was 1,910,000,000 lb. last year as against 1,886,000,000 lb. in 1917 and 1,224,000,000 in 1913. The supply of refined copper from primary sources for the year, including both domestic and foreign figures, is estimated at 2,450,000,000 lb., compared with 2,362,000,000 lb. in 1917 and 1,615,000,000 lb. in 1913. The production was thus distributed over the country: Arizona produced 777,000,000 lb. against 712,000,000 in 1917; Montana 328,000,000 against 274,000,000; Michigan 225,000,000 against 268,000,000; Utah 233,000,000 against 245,000,000; Nevada 105,000,000 against 122,000,000; Alaska 69,000,000, a heavy decrease; New Mexico 98,000,000 against 105,000,000. California is estimated at considerably above the 48,000,000 lb. that was produced in 1917. The output in Tennessee was about 14,500,000 pounds.

Imports for the first 11 months of the year were 535,868,000 lb., compared with 556,000,000 lb. for the 12 months of 1917. Exports of copper, including pigs, ingots, bars, plates, sheets, rods, wire and products, for the first 11 months of the year were 692,759,000 pounds.

At beginning of 1918 about 114,000,000 lb. of refined was in stock in the United States. Adding this to refinery output shows total available supply about 2,564,000,000 lb. Subtracting exports for 11 months and estimated exports for last month shows, on assumption there was no change in stocks, that supply available for domestic consumption in 1918 was considerably more than 1,316,000,000 lb. available in 1917.

EXPLOSIVES in most common use in quarries are black blasting-powder, granulated powder containing a small percentage of nitro-glycerine, dynamite containing 15 to 60% nitro-glycerine, ammonia dynamite, and blasting gelatin. The choice depends mainly on the nature of the material to be broken.

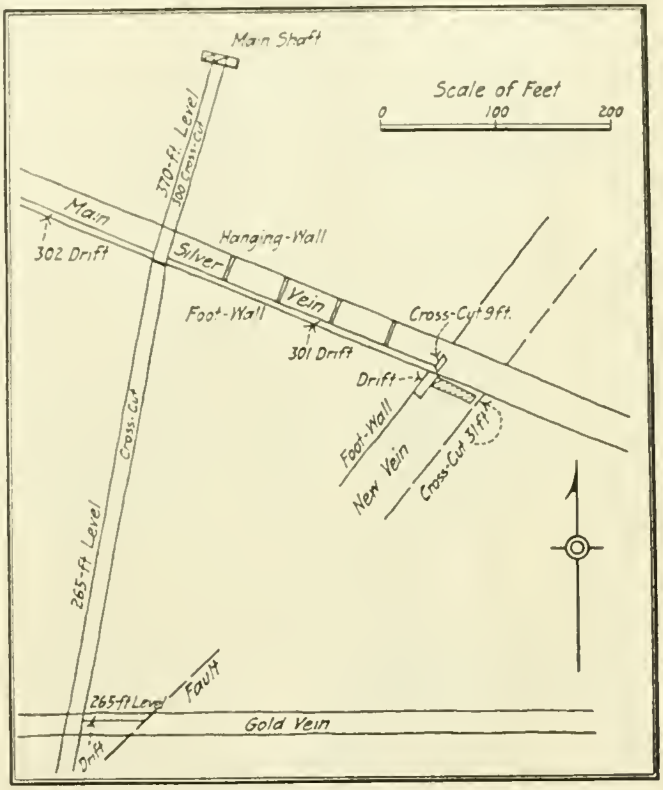
THE HOLLINGER, at Porcupine, Ontario, is the richest gold mine on this continent. In 1918 it produced $6,250,000 worth of gold and paid $1,230,000 in dividends.

REVIEW OF MINING

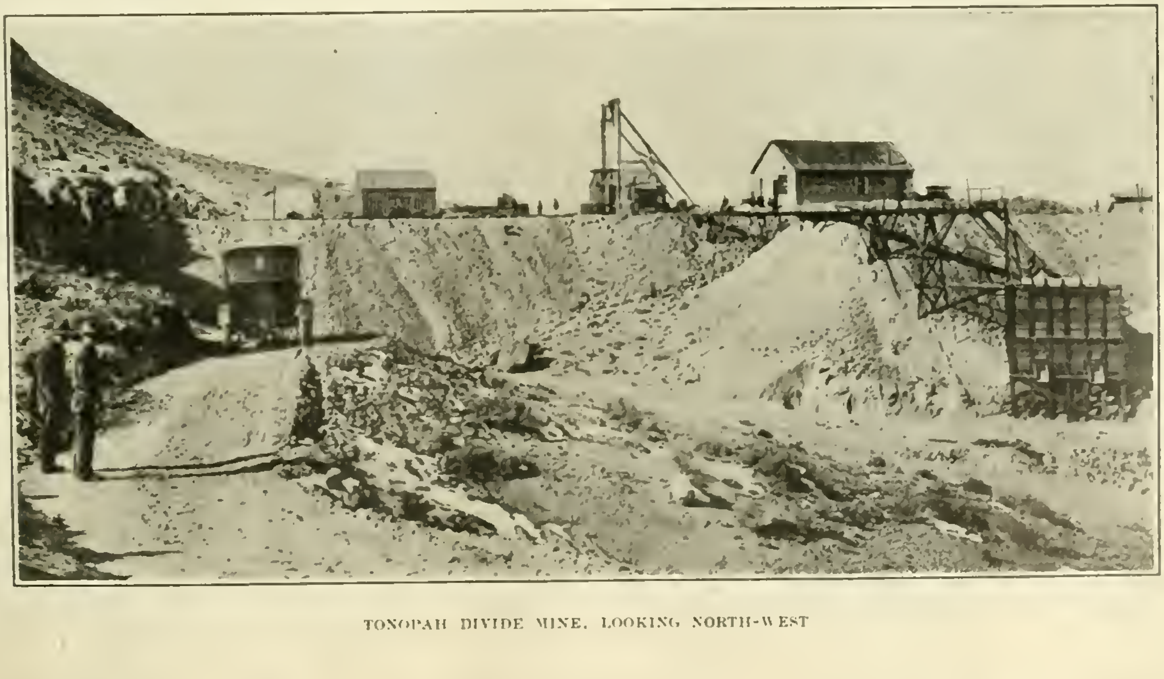
TONOPAH, NEVADA

Important Developments in the Divide District.

In the Tonopah Divide mine, six miles south of Tonopah in the Divide district, a cross vein has been found in exploring what has been known as the main silver vein on the 370-ft. level. The newly-opened shoot is said to be the older fissure and the source of enrichment of the ore-channel that has been opened for a length of over 300 ft. The shaft was sunk for the purpose of cutting, on its dip to the north, a vein that crops near the high summit to the south and that had produced rich ore from surface workings. A cross-cut south on the 165-ft. level penetrated the silver vein 140 ft. from the shaft. This vein outcrops boldly in places, but shows little of value at the surface. The shaft was continued to the 370-ft. level, and cross-cuts were driven to the silver vein on the 265 and 370-ft. levels. A cross-cut extended south on the 265-ft. level cut the gold vein 580 ft. from the shaft, and a drift east on this vein exposed gold ore assaying from $40 to $80 per ton, varying from 2 to 4 ft. wide. Drifts on the silver vein were extended both ways from the cross-cuts on three levels, and at 50-ft. intervals raises and cross-cuts have been driven to block-out the ore for a distance of over 300 ft. along the vein, showing a mean width of 25 ft. of ore. On the 370-ft. level the south-east foot-wall drift, at a point 250 ft. from the shaft cross-cut, exposed the foot-wall of the new vein. This wall, like that of the silver vein, stands nearly vertical, with a slight south-east dip. The silver vein has a south-east strike, the new vein north-east, and the gold vein almost due east. High-grade ore was found at the foot-wall of the new vein, the faces for several days here assaying from $150 to $300 per ton. A drift was started south-west along the foot-wall of the new vein and a cross-cut through the latter, back of the foot-wall of the silver vein. The rock between these faces was broken down to the point where a 12-ft. face was exposed. Of this ore, a width of 5 ft. assayed $236 and 7 ft. sampled $87; car samples averaged $177 per ton. The cross-cut was continued 31 ft. before the hanging wall



UNDERGROUND WORKINGS OF THE TONOPAH DIVIDE MINE



TONOPAH DIVIDE MINE, LOOKING NORTH-WEST

appeared. At 22 ft. the face assay dropped to \$48, but after the next round of shots it was \$68 per ton. A cross-cut here back into the silver vein gave an average of \$265 for a length of 9 ft. The area about the point of junction of the two walls is greatly crushed and contains seams and masses of kaolin, filled with particles and sheets of glassy horn silver. Large pieces of this ore have been found, containing 1000 oz. of silver per ton. At other points native silver is present. The main shaft is being sunk below the 370-ft. level by means of auxiliary hoisting equipment, and is down 465 ft. Sinking will continue to water-level, estimated to be not less than 700 ft., and stations will be cut at 100-ft. intervals. The property is owned chiefly by J. C. Brougher of Tonopah and George Wingfield of Reno; William Watters is superintendent, and A. I. D'Arcy is consulting engineer and has directed all development. Mr. D'Arcy's analysis of the district geology shows the mountain to be composed of a series of rhyolites, the upper strata being a hard, fine-grained, and glassy rhyolite showing distinct phenocrystals of quartz. Below this is a thin bed of fine-grained rhyolite breccia and below this a series of fine-grained rhyolites, the distinguishing features of which are the stratifications due to the floor structure of this series. The lowest rock exposed on the mountain is a rather coarse-grained rhyolite breccia. The silver vein was found in the rhyolite breccia, but the gold vein was found on the 265-ft. level encased in the upper rhyolite, owing to fault action that has brought this rhyolite down to the level of the breccia, and the opinion is expressed that only at and below the 465-ft. level will this vein be found encased in the breccia that forms the casing of the other ore-channels. Ore from the Tonopah Divide mine is now being hauled to the MacNamara mill at Tonopah, and an early increase in production is probable. Shipments have been at the rate of 300 tons weekly, and until recently most of this ore went to the Goldfield Consolidated mill.

Exploration at adjacent properties has been in progress for several months. On the Brougher Divide, adjoining the Tonopah Divide mine on the north-west, drifts have been advanced for a considerable distance in the Divide vein on the 177-ft. level, but no pay-ore has been found. The shaft is being sunk deeper; it is now below the 375-ft. point and lateral work is to be resumed at the 400-ft. level.

TONOPAH GOLD MOUNTAIN DISTRICT

The Gold Zone, adjoining the Tonopah Divide on the south-east, explored the main silver vein on its 295-ft. level and had a full face of \$11 ore near the Divide boundary. Sinking was resumed and the vein has just been cut on the 500-ft. level, not far from the Divide end-line.

The Tonopah Dividend, adjoining the Brougher on the north-west, has been exploring on the 300-ft. level and has cross-cut the main silver vein, known in this territory as the Brougher vein, securing some good assays. Drifts are now being started both ways in this vein, which is over 40 ft. wide in this territory.

The Divide Extension has a shaft down over 150 ft. but has not been working for some time. It is announced that sinking will be resumed at once.

The East Divide, east of the Gold Zone, is sinking with good equipment near a prominent blow-out where the vein cropping yields assays up to \$5 in gold. The shaft, down 175 ft., is in the breccia typical of the Tonopah Divide mine and cross-cuts will be driven at the 200-ft. level.

The Hasbrouck is driving a long tunnel, and has cut good ore in it and in the shaft workings. It has produced shipping ore in considerable quantity.

The Sutherland Divide, situated over 2000 ft. north of the Divide, has a 400-ft. incline shaft, and has produced shipping ore from this shaft and from surface workings. It is to be equipped for lateral work on the 300 and 400-ft. levels, and a cross-cut is now being driven at 300 feet.

The Gold Reef group, south-east of the central properties, and the Gold Seam, south of the Gold Reef, show good vein croppings and are to be developed at depth.

The Rosetta Divide has had some good surface assays, and is preparing for work on a substantial scale. Several other properties in the district will soon be under development, stimulated by the results of work in the Tonopah Divide mine, and the district now promises to become the most active in Nevada during the next few months.

SAN FRANCISCO, CALIFORNIA

The American Mining Congress in California.

On January 15 and 16, a total of 160 mining and oil-men attended the convention called by the California Metal Producers Association of San Francisco and the Chamber of Mines and Oil of Los Angeles to organize a California chapter of the American Mining Congress. Albert Burch presided, with G. M. Swindell as secretary.

Mining politics is the special business of the American Mining Congress, according to the secretary, J. F. Callbreath, whose address we shall publish at an early date.

The history of the American Mining Congress was briefly covered by H. Foster Bain, Assistant Director of the Bureau of Mines. The origin of the Congress was in Gilpin county, Colorado. The dominant idea was to have a member—a Secretary of Mines—of the President's Cabinet who would look after the mining industry. Conventions were held. J. J. Holmes of Carolina was one of the active members, he eventually becoming director of the U. S. Bureau of Mines. The present Mining Congress is vastly different from that of the early days. Several coal-mine explosions resulted in investigations being made for the safety of miners, when the Mining Congress saw its opportunity, and in 1910 the Bureau of Mines was created. The scope of the Bureau has enlarged greatly. The War showed that the mining industry was not in concentrated hands, and the formation of a mining department has recently come up again. Franklin K. Lane, head of the U. S. Bureau of Mines and Geological Survey, would make a good Secretary of Mines. A representative mining organization will always receive attention at Washington.

The president of the American Mining Congress, Bulkeley Wells, general manager of the Smuggler Union mine, Telluride, Colorado, said that for years the American Mining Congress was Mr. Callbreath, and Mr. Callbreath was the American Mining Congress. At one time he was owed over \$15,000. The present scope of the activities of the head office at Washington is more extensive than realized. Committees sent to the Capital to watch mining legislation have no entré, therefore the Mining Congress guides them to the right quarters. One important function of the head office is to advise Government bureaus on certain phases of mining under consideration. Until 18 months ago the Mining Congress consisted mainly of small operators, the larger people thinking that they could fight their troubles alone. Since then the latter have come in, seeing that co-operation is best.

The War Minerals Relief Bill—to give aid to chrome, magnese, pyrite, and other products—would not have received attention unless the Mining Congress had been behind it. Another accomplishment of the Congress was in fighting taxation, and when the Gold Commission in November 1918 was heard by the Treasury Department at Washington, the gold crisis was fully discussed. Unfortunately the end of the War relieved the urgent need of relief to producers. Mr. Wells thinks that eventually aid will be given, probably through operation of the Revenue Bill.

Regarding the labor situation, Mr. Wells considered that it would be folly to reduce wages until the cost of living is changed. If this were forced there would be disaster.

The active support of members of the Mining Congress is urged; officers should be backed vigorously and promptly. Mr. Wells hoped that the Mining Congress was here to stay.

Mr. Burch followed Mr. Wells by saying that until a year ago he knew nothing of the American Mining Congress, but when at Washington he saw the valuable work being done by this organization. An instance was the aid given the silver producers who eventually received $1 per ounce, mainly through the Congress.

Regarding the Revenue Bill for 1918 and gold producers, Mr. Callbreath here added that if passed by Congress, it would mean that companies producing gold from a gold mine and gold from a base-metal mine would be relieved of taxation to the amount of such production.

Few mining projects have ever been financed by banks, according to Albert Burch when introducing J. K. Lynch, Governor of the Federal Reserve Bank to the mining men assembled at lunch on the 15th. Mr. Lynch said that civilization and mining have gone hand in hand; metals are necessary for such a state of living. He briefly traced the use of metals. The world is dependent on iron for progress; electricity is dependent on copper mining. The most interesting metals to the miner are gold and silver. No market has to be found; it is always available with cash. When a $20 piece is given for groceries or the like, a barter has taken place, there being received value for value. Credit, the clearing-house, and paper all reduced the amount of gold needed to be handled; then came the Federal Reserve Bank to further reduce the quantity held by banks. Gold and silver production has not increased as fast as the credit of the world, and gold is still the medium of settlement of balances. Mr. Lynch thinks that there will be a drop in the price of silver later.

From the banker's standpoint, mining may be divided into four stages: (1) prospecting, (2) exploration, (3) development, and (4) production. When a mine is ready for production it may be considered a manufacturing business; until this stage is reached the banker is not interested. The bank is only lending other people's money and must be careful, and will not lend until the property is scientifically developed and equipped for production. Most mining today is not for the poor man, it is one for capital.

The gold reserve in Federal Reserve Banks on January 3, 1919, was $2,092,000,000, about 33% of the gold in the country; but estimates of the total gold are generally doubtful, due to unknown quantities hoarded. The ratio of gold to credit in this country at June 30, 1918, was 1:5; at the end of the next fiscal year it is estimated at 1:12½. Only for the Federal Reserve Bank the country would have been bankrupt during the War; the gold was concentrated in this bank from other banks.

'The Attitude of Bankers Toward Mining Investments' was the important topic covered by Frank B. Anderson, president of the Bank of California at San Francisco, at the second day's luncheon. This speech will be published in another issue.

Accomplishments of the American oil industry during the War were discussed at considerable length by T. A. O'Donnel, formerly assistant to the oil director of the U. S. Fuel Administration, in charge of production. He considered that every phase of the conflict was dependent upon petroleum, which mostly came from the United States. The Government here did not force the oil producers to do anything, but when asked to do what they could there was a ready response by spending large sums in additional equipment, much of which will be useless after the War. In spite of everything, the oil output in 1918 was 3% greater than in 1917.

In discussing the effect of publicity upon mining, T. A. Rickard, editor of the 'Mining and Scientific Press', dwelt upon the general good results that come from the public and employees knowing what is being done by a mining company; how a little judicious advertising and writing aids engineers; and how the American Mining Congress can be benefited by publicity. The War brought home to Americans the great importance of mining, about which they would otherwise have remained comparatively ignorant.

One of the desires of the American Mining Congress is the appointment of a Secretary of Mines, to be a member of the President's Cabinet. This phase was discussed by Judge John F. Davis, who has graduated, so to speak, from mining to law. His address will be reproduced in the 'Press' later.

The War has shown the fundamental relationship and dependencies of industry upon fuel; peace has not altered this, according to D. M. Folsom. He referred specially to oil-fuel, particularly in the Pacific Coast region. This paper will also be published later on.

DENVER, COLORADO

American Mining Congress and Colorado Metal Miners Association Meet.

The first important event of the new year for Colorado's mining industry was the joint meeting of the Colorado Chapter of the American Mining Congress and the Colorado Metal Miners Association during three days at the Brown Palace hotel, Denver. The sessions on January 2, 3, and 4 were well attended. It was noticeable that the mining men of the State are finally getting together in a worth-while way, this meeting displaying more enthusiasm and concerted opinion than has been manifested at any meetings heretofore. Until within the past two or three years the main support of these organizations has remained with a relatively few small-mine operators, who usually held discordant views regarding ways of securing relief from their hardships. During discussions in former sessions it often seemed that there existed a wide gap between the interests of operators of small mines on one hand and of large mining companies on the other, and that co-operation between the two classes could not be expected to bring back to Colorado the same degree of universal interest in metal mining that prevailed some years ago. However this wrong point of view has been removed through the efforts of the officers in these two organizations, with the result that successful large-scale operators of the State are prominent in the affairs of both the Mining Association and the local Mining Congress chapter. Harmony now prevails, and the small miner feels that his general interests are identical, in most respects, with those of the large mining corporations.

Taking all things into consideration no meetings in Colorado in recent years have been more harmonious or portended greater benefits to the State's metal-mining industry.

THE MINING SUMMARY

ALASKA

Juneau.—Alaska Gastineau in December produced 117,310 tons of 98.3-cent ore, recovering 80.57%. The past two years compare as under:

	1918		1917	
Month	Tons	Value	Tons	Value
January	179,300	$0.903	173,300	$1.240
February	140,305	0.934	150,000	1.350
March	150,003	1.114	217,700	1.090
April	125,435	1.148	212,200	1.090
May	101,200	1.114	227,900	1.787
June	82,600	1.250	202,400	1.102
July	74,830	1.319	166,988	0.985
August	90,250	1.367	179,150	0.994
September	47,850	1.247	177,828	1.064
October	75,870	0.995	191,610	1.069
November	94,395	0.968	175,960	1.080
December	117,310	0.983	165,131	1.036

McKinley.—According to a circular of the bondholders committee, the Valdez Creek Placer Mines company has defaulted in the payment of interest on its bonds ($500,000) and notes ($731,481) and defaulted in part in the payment of principal. The company is to be reorganized as the McKinley Placers, after the post-office at Valdez Creek. Present bondholders are to get $560,000 in 8% preferred stock in exchange for their bonds and coupons thereon up to January 1, 1919; in exchange for notes held it is proposed to issue a second 8% preferred stock; and holders of shares are to get one share of common stock, $5 par, for every five shares of Valdez Creek stock now held. Henry A. Cutter of Nashua, New Hampshire, is counsel.

ARIZONA

Ajo.—New Cornelia produced 4,248,000 lb. of copper in December, one of the largest outputs since starting in June 1917.

Bisbee.—Shattuck-Arizona produced in December, 506,332 lb. of copper, 401,593 lb. of lead, 21,506 oz. of silver, and 86 oz. of gold.

The lead-flotation plant of the Shattuck-Arizona company was closed last week, 85 men being laid off.

Calumet & Arizona yielded 3,904,000 lb. of copper in December.

Clifton.—The mines of the Shannon Copper Co. were closed on January 4. The company has operated at a loss during the past six months, partly due to the increased freight rates of 25%, increase in wages, and a stagnant market. Mr. Bennie, the general manager, is to remain at Clifton for the present, and the resumption of operations will depend upon the future copper market.

Arizona Copper Co. produced 3,600,000 lb. during December.

Metcalf.—The Shannon company produced 688,000 lb. of copper in December. There has been almost a general decline since the 972,000 lb. in January last.

Phoenix.—A six-inch vein of almost pure cinnabar has been opened at the Jeter and Larson mine in the Phoenix mountains, north of Phoenix.

Ray.—The Ray Hercules is producing about 300,000 lb. of copper monthly. The mill has treated as much as 1100 tons per day, recovering 87%. The ore has been as low as 1% copper, no sorting being done. It is said that the company is considering erection of a smelter, jointly with the Magma Copper Company.

ARKANSAS

Yellville.—Zinc-ore production in northern Arkansas last year totaled 1730 tons, also 70 tons of lead. The district of Zinc contributed 1000 tons, Rush 345 tons, and Yellville 105 tons. Except at the first-named centre nearly all the mines were closed since last spring. The Bald Hill company at St. Joe is said to have 750 tons of ore in bins; other mines also have large stocks. A better demand for carbonate ore has resulted in the re-opening of several properties.

COLORADO

Boulder.—It is reported that the Colorado Pitchblende Co. recently paid $10,000 as final settlement for properties acquired at Jimtown. The president, J. F. Barnhill, announced that the company will construct a railway to Jimtown, also a mill.

Breckenridge.—The Wellington Mines Co. has just paid a dividend of 10%, equal to $100,000. This makes a total of $1,850,000. The company's cash resources are $407,894. This mine produces zinc ore.

Salida.—The Ohio & Colorado Smelting Co. at Salida reports the following ore receipts during 1918:

Counties	Ore, tons	Gold, oz.	Silver, oz.	Lead, lb.	Copper, lb
Chaffee	4,028	2,493	30,312	896,032	......
Custer	4,003	205	95,860	292,917	52,010
Dolores	140	....	1,124	54,233	86
Eagle	10,809	920	189,965	146,134	387,445
Gunnison	1,486	479	7,178	20,365	73,599
Hinsdale	1,119	294	14,704	693,400	14,815
Lake	58,730	3,004	556,283	1,708,106	188,198
Ouray	7,137	2,813	382,692	2,614,219	79,902
Saguache	1,774	129	84,360	134,579	131,291
San Juan	3,905	1,967	63,500	2,683,478	277,525
San Miguel	516	85	16,019	210,773	32,589
Summit	1,658	71	12,600	148,853	3,893
Colorado total ...	95,305	12,460	1,454,597	9,603,089	1,241,353
Idaho	19,459	....	537,931	16,460,972	41,971
Oklahoma (zinc residues)	23,198	3,776	790,872	3,132,349	501,517
Mexico	218	....	3,733	197,493	1,100
Grand total	138,180	16,236	2,787,133	29,393,903	1,785,941

IDAHO

Salmon.—The manager for the Harmony Mines Co., E. F. Nieman, estimates that reserves amount to 60,000 tons, so a concentrating plant is to be erected for the copper ore.

At the Big Dyke mine a Koering cyanide process plant is being erected in charge of C. W. Sherwood. A hydro-electric plant is also under construction.

MISSOURI

Joplin.—Production of the Tri-State region last week was:

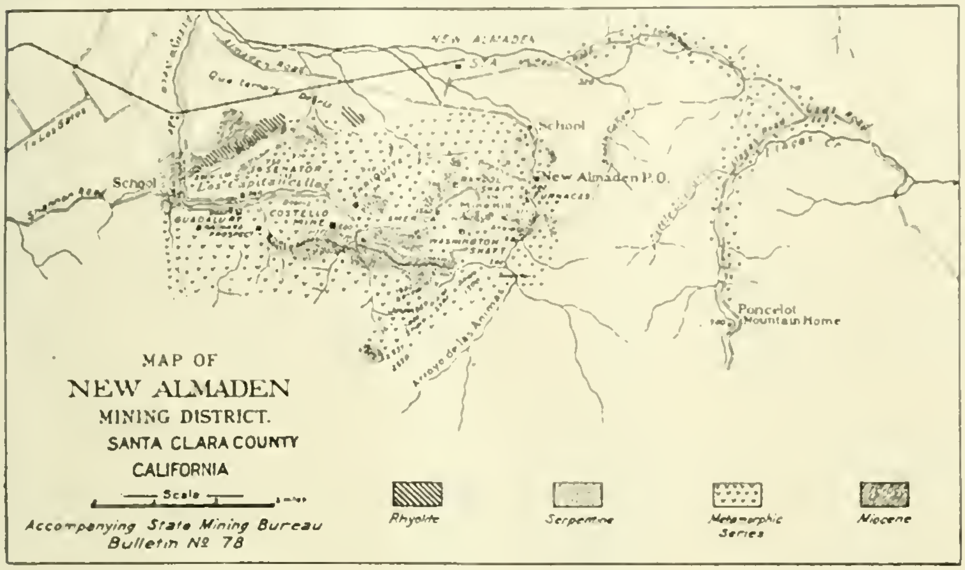
State	Blende, tons	Calamine, tons	Lead, tons	Total value
Kansas	98	...	196	$16,170
Missouri	1,139	470	150	81,689
Oklahoma	5,076	...	885	276,144
Average price per ton.......	$45	$38	$60	......

MICHIGAN

Houghton.—Calumet & Hecla and subsidiaries now are using 42 storage-battery locomotives for ore haulage—12 at Isle Royale, 12 at Ahmeek, 5 at North Kearsarge, and 13 at the Calumet & Hecla. Five more have been ordered for the last named. They are working quite satisfactorily. The Allouez is using all trolley locomotives.

CALIFORNIA

Almaden.—It is reported from San Jose that a quarter interest in the New Guadalupe Mining Co. has been sold by J. L. Stubbs to H. C. Davey for $100,000. Extensive improvements are to be made. The total recorded output to the end of 1917 was 105,772 flasks of quicksilver. The 1918 yield was about 1000 flasks.



Copperopolis.—Calaveras county in 1918 yielded 6,480,000 lb. of copper, a decrease of 1,250,000 lb. when compared with 1917, but as large as any previous year save 1910. The Calaveras Copper and Penn Mining were the principal contributors.

Engelmine.—During 1918, Plumas county copper mines produced about 11,700,000 lb., against 7,463,000 lb. in 1917, 4,933,000 lb. in 1916, 3,165,000 lb. in 1915, and 150,000 lb. in 1914. The Engels company is the largest producer, its figures for the last and previous periods being, according to M. E. Dittmar of Redding:

Year	Ore tons	Copper, lb.
1915	59,741	2,893,133
1916	168,712	4,312,408
1917	157,423	5,040,741
1918	275,000	9,100,000

Two flotation mills are at work, one of up to 500 and the other up to 600 tons capacity.

Another good copper producer in Plumas is the Walker, near Portola.

Forbestown.—The old Denver mine here is reported to have been purchased from C. L. Falck by San Francisco people for $40,000. The workings are to be unwatered.

Kennett.—Copper production of Shasta county last year was about 24,680,000 lb., 4,000,000 lb. less than in 1917, and 15,000,000 lb. less than in 1916. The Mammoth, Balaklala, Mountain Copper, Afterthought, Bully Hill, and other mines contributed. Some important developments were reported from the Crystal and Oak Run copper mines.

Placerville.—James Nutley, field superintendent for the Linscott Drilling Co., of San Francisco, with a crew of 10 men, is drilling five holes with Keystone machines, to the depth of 60 ft. to sample the Rocky Bar gravel mine, situated on the middle fork of the Consumnes river, 14 miles due north-east of Placerville.

Sacramento.—One of the bills introduced to the Legislature Assembly on January 15 was that of Mr. McColgan, to compel underground mining companies to pay employees from the time they enter the mine until they reach the surface.

A joint resolution endorsing the National Congressional proposal to reimburse various individuals and corporations for losses sustained in producing war minerals such as chrome was introduced to the Assembly by Senator Rigdon on the 15th.

San Luis Obispo.—A. H. Simpson, who was managing a group of chromite producing properties in El Dorado county for the Union Chrome Co., now has charge of a manganese mine for the Manganese Company of California, seven miles from this place. The daily output is 10 tons of high-grade di-oxide ore.

Sutter Creek.—At the Old Eureka the shaft is down 2880 ft., with 270 ft. to go.

The Central Eureka is increasing work on its 3500-ft. level. Good ore has been opened at 3450 ft., from which it is sent to the mill.

MONTANA

Butte.—Anaconda is reported to have reduced operations by over 25%. due to the metal markets.

The Pennsylvania mine of the Anaconda group was closed indefinitely on January 10. The daily output was 1200 tons of ore, employing 750 men.

Butte & Superior produced 10,600,000 lb. of spelter and 220,000 oz. of silver during December. The average for 1918 was 11,500,000 lb. per month, the range being from 6,850,000 to 14,300,000 pounds.

East Butte produced 1,929,720 lb. of copper in December, nearly up to the average.

North Butte yielded in December 2,230,507 lb. of copper and 97,443 oz. of silver.

Davis-Daly produced 977,015 lb. of copper and 37,972 oz. of silver in December. This is the largest return for 1918, save 1,013,521 lb. in January.

Missoula.—The main plant of the lumber department of the Anaconda company at Bonner, seven miles east of this place, was totally destroyed by fire on the 16th. The damage probably will amount to $500,000.

NEVADA

Ely.—Labor troubles of the Nevada Consolidated were settled last week. Little change was made in conditions of employment.

Tonopah.—Production of the district last week totaled 7450 tons of ore, valued at $126,650. Nine mines contributed, including the Tonopah Divide with 225 tons.

December yelds were as under:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Tonopah Belmont	8,937	113,115	1,080	$57,227
Tonopah Extension	9,617	122,248	1,197	57,703
Jim Butler	...	......	....	5,555

West End pays 5 cents per share, equal to $89,424, on February 18.

OKLAHOMA

Picher.—The Great Premier company paid a dividend of $20,000 late in 1918, and another on January 1 of $50,000. The surplus is $30,000. A. M. Gains is in charge.

Production of Oklahoma fields last week totaled 5076 tons of blende and 880 tons of lead, valued at $276,144.

UTAH

Alta.—The Wasatch Mines Co.'s tunnel is now in 3300 ft., directly under the Columbus-Rexall dump. Two shifts are driving up to 8 ft. daily.

Columbus-Rexall paid 2½ cents per share last week, the sum of $14,600. A restraining order of the Monetaire company had held up the disbursement until the District Court declined further to allow this.

Bingham.—Utah Copper Co. closed its Boston Consolidated property on the 17th, dispensing with 400 men.

The Utah-Apex company has laid-off 300 men.

Eureka. The Centennial Eureka is sinking a winze in good ore below water-level 1900 ft. depth. The present flow is 250 gal. per min. This is pumped to the 1800, 1200, and 600-ft. levels, in three lifts. Additional pumps will give a capacity of 1250 gallons per minute.

At a depth of 2200 ft. the Iron Blossom company has cut a promising stringer of lead ore. Rich copper ore is being followed below the 1100-ft. level.

The Iron King company's new shaft is down 1300 ft., with encouraging indications. This shaft is to prospect for an extension of the orebody from the Tintic Standard adjoining.

The new drainage-tunnel of the Jesse Knight company is in 1800 ft. This will drain several mines in the eastern and southern parts of the district. Henry Barney is in charge.

Provo.—Iron Blossom pays 2½ cents per share on January 25. This is equal to $25,000, and makes the total $3,200,000.

Tintic.—Chief Consolidated pays 12½ cents per share on February 1. This amounts to $110,529, and brings the total to $1,345,399. The cash surplus is $194,280, plus $505,482 of Liberty Bonds, etc.

The Copper Leaf company's shaft is down 1060 ft., and it has been decided to continue to 1200 ft., and drive at 1000 ft. Machinery to cost $2000 is to be purchased. Cash on hand amounts to $19,000. J. W. Taylor is superintendent.

WASHINGTON

Keller.—At the Walla Walla mine, 500 ft. of air pipe is being hung to permit of extending the adit to the Handspike vein. If as rich ore is found as in the upper workings the company will erect a mill. J. E. Leonard is in charge.

CANADA

Ontario

Boston Creek.—The Allied Gold Mines has been organized by Detroit, Michigan, people to work the O'Donald and Cutler-Renaud claims here. Diamond-drilling is under way. R. W. Norrington is in charge.

Cobalt.—Trethewey paid a dividend of 5% on January 2. This amounts to $50,000, and makes a total of $1,211,999.

MEXICO

Durango

Guanacevi.—At the Anita mine, E. F. Knotts of El Paso, Texas, is erecting a 50-ton flotation plant, including ball-mill and revolving filter.

Sonora

Cananea. Owing to the uncertain copper market about 2500 men have been laid off by companies in this district.

Greene-Cananea produced 5,100,000 lb. of copper and 174,900 oz. of silver during December. The total for 1918 was 53,270,000 lb. and 1,549,672 oz., compared with 30,260,000 lb. and 807,247 oz. in 1917. Trouble with the Government caused a shut-down in mid-1917.

Hermosillo.—According to advices received at Monterrey, the United States Graphite Co. has resumed extensive development at its property. Regular shipments of 80 tons daily of high-grade graphite are now being made. The mineral is obtained mostly from open-cuts and is hauled to rail, a distance of 20 miles, by motor-trucks. The company is composed of Grand Rapids, Michigan, men. The crude graphite is shipped to the company's refinery in the East.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Askin M. Nicholas is at Globe, Arizona.

W. P. Lass has returned to Seattle from Juneau, Alaska.

Howland Bancroft, of Denver, was in San Francisco last week.

G. W. Miller has opened an office as consulting engineer at Los Angeles.

W. H. Blackburn, of Tonopah, has been elected president of the Nevada Mine Operators Association.

T. O. McGrath, secretary of the Shattuck-Arizona Copper Co., has returned to Bisbee from a visit to Chicago.

Lafayette Hanchett has been retained as consulting engineer to the Silver King Coalition Mines Co., of Park City, Utah.

H. Foster Bain represented the Bureau of Mines at the recent meeting, in San Francisco, of the American Mining Congress.

Charles H. White has received his discharge from the Army and is returning to resume his practice as mining geologist in San Francisco.

J. W. Sherwin has not resigned as general manager for the West End Mining Co., but his office has been moved from Tonopah to Oakland, California.

Fergus L. Allan, manager of the Mexico mine at El Oro, and **Hedley D. Crowder**, manager for the Mexican Exploration Co., have been taking a holiday in California.

Selwyn G. Blaylock, assistant general manager for the Consolidated Mining & Smelting Co. of Canada, was married to Miss Kathleen Riddle on December 31 at Calgary, Alberta.

Russell R. Bryan has resigned as hydro-metallurgist with the U. S. Bureau of Mines to accept the position as metallurgist with the Sunnyside Mining & Milling Co., at Eureka, Colorado.

Edgar Rickard, Millard K. Shaler, and **Walter L. Brown** have received the honor of being made Chevaliers of the Legion of Honor in recognition, by the French government, of their work in behalf of the Belgian Relief Commission in the invaded territories.

C. F. Kelley of the Anaconda, **Joseph R. Clendenin** and **Murray Guggenheim** of the A. S. & R., and **R. L. Agassiz** of the Calumet & Hecla sailed from New York to Europe on January 20 in order to confer with the foreign metal consumers on behalf of the Copper Export Association.

A. T. Thomson, assistant to the president of the Phelps Dodge Corporation, Copper Queen branch, and **John S. Williams, Jr.**, general manager for the Moctezuma Copper Co., at Nacozari, were at Bisbee last week in conference with **G. H. Dowell**, general manager of the Copper Queen branch.

The California Chapter of the American Mining Congress announces the following members elected on January 16:

Directors for one-year term: Andrew Carrigan, L. D. Gordon, M. H. Whittier, K. R. Kingsbury, and Clifford G. Dennis.

Directors for two-year term: Albert Burch, George W. Metcalfe, W. J. Loring, E. L. Doheney, and John Barneson.

Directors for three-year term: F. W. Bradley, T. A. Rickard, J. H. Mackenzie, L. P. St. Clair, and H. R. Gallagher.

Mr. Rickard has declined the honor, believing that he can be more useful as a detached critic and friend of the Congress.

THE METAL MARKET

METAL PRICES

San Francisco, January 21

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	22.00
Lead, pig, cents per pound	5.75—6.75
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb	$100
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	16.00

EASTERN METAL MARKET

(By wire from New York)

January 21.—Copper is inactive. Lead is dull. Spelter is lifeless.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, and on December 13 to 48 7/16 pence.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast. This will continue for some months.

Monthly averages

UNITED STATES CONTROL OF MINERALS

The United States is more nearly self-sustaining in regard to mineral commodities as a whole than any other country on the globe, according to C. K. Leith of the U. S. Geological Survey. The following statement summarizes qualitatively our position:

1. Minerals of which there is an adequate supply or exportable surplus in the United States:

A. Minerals of which our exportable surplus dominates the world situation: Copper and petroleum.

B. Minerals of which our exportable surplus constitutes an important but not a dominant factor in the world trade: Sulphur, phosphate, silver, iron and steel, coal, cement, uranium, and radium.

C. Minerals of which our exportable surplus is not an important factor in world trade. Small amounts of most of these minerals have been and will doubtless continue to be imported because of special grades, back haul, or cheaper sources of foreign supply, but these imports are for the most part incidental: Lead, zinc, aluminum and bauxite, gold, tungsten, molybdenum, asphalt and bitumen, pyrite, barite, fluorspar, building-stone (except Italian marble), cadmium, gypsum, lime, tripoli and diatomaceous earth, mineral paints (except umber, sienna, and ochre from France and Spain), pumice, garnet, salt (except special classes), talc, arsenic, bismuth, bromine, artificial abrasives, corundum, and emery (except naxos emery), fuller's earth, and mercury.

2. Minerals for which the United States demand must continue to be met by imports:

A. Minerals for which the United States must depend almost entirely on other countries: Tin, nickel, platinum and metals of the platinum group.

B. Minerals for which the United States will depend on foreign sources for a considerable fraction of the supply: Antimony, vanadium, zirconium, mica, monazite, graphite, asbestos, ball clay and kaolin, chalk, cobalt, naxos emery, and grinding-pebbles.

3. Minerals normally imported into the United States which in future can be largely produced from domestic sources if it seems desirable:

A. The following minerals were mainly imported before the War, but under war conditions the domestic resources have been developed to such an extent that the United States can become self-sustaining if desirable, though at so great a cost that a protective tariff will be necessary if these industries are to survive: Nitrates (except potassium nitrates), potash, manganese, chromite, and magnesite.

Eastern Metal Market

New York, January 15.

All markets are decidedly inactive, and the price tendency is downward.

Antimony is changed but little.

Copper has sold as low as 20c. per pound for first-quarter delivery.

Lead has become inactive again, with lower prices possible.

Tin continues stagnant with fundamental conditions unchanged.

Zinc demand is light, and quotations are lower.

ALUMINUM

Market conditions are governed by the Government maximum prices which are left effective until March 1 for No. 1 virgin metal and for scrap. They are 33c. per lb. for 50-ton lots, 33.10c. for 15 to 50-ton lots, and 33.20c. for 1 to 15-ton lots.

ANTIMONY

The market is quiet and steady, perhaps a little stronger. Quotations are 7.75 to 8c., duty paid, New York, for wholesale lots for prompt and early delivery.

COPPER

Almost each day since the first of January has seen the copper market seeking lower levels. While some think that 20c. is the low mark, others expect as low as 18c. before the turn comes or before bottom is reached. Little is now heard of 23c. copper, excepting for export, which is the quotation still of the Copper Export Association. Both electrolytic and Lake copper are now quoted at from 20 to 21c., New York, for delivery in the next 30 to 90 days, or the first quarter. Some sales have been made at these prices, but no large quantities have changed hands. Nevertheless a fair business has been done and we quote the market at 20.50c., New York, for early delivery. Some producers have made sales at 23c. with the price to be paid ruling at the time of shipment. No sales have been made for foreign shipment, despite statements of buying by Italy. The large foreign countries have big stocks estimated to be sufficient to last two to three months, and it is not expected that buying from this source will materialize before the end of that period. England is officially reported to have had 36,000 long tons in stock on January 1. A few representatives of the Copper Export Association will soon sail for Europe to investigate the copper market and its prospects, and perhaps attempt to make sales. Domestic output has shrunk decidedly in the last few weeks, estimated by some to be only 60% of what it was previous to the end of the War.

IRON AND STEEL

The week has been devoid of features, and the market is quiet. Incomplete surveys indicate that the aggregate of peace-time buying is larger than generally supposed, but no attempt is made to express it in figures. Producers generally describe conditions as better than expected. The trade has been used so long to full-steam operation that it is not yet accustomed to the present low demand. A surplus of labor has already appeared at steel plants with offers to work at lower than existing wage-scales. Estimates of the 1918 output of steel ingots show it to have been 42,212,000 tons, according to statistics compiled by the American Iron & Steel Institute, from reports submitted by 29 companies which made 85.1% of the 1917 output.

LEAD

The market has again turned dull and the quickened demand, evident last week, has disappeared. Quotations are unchanged at 6c., New York, or 5.70c., St. Louis, from the American Smelting & Refining Co., with the outside market at 5.75c., New York. The outside St. Louis quotation for some reason is 5.50c. and not 5.45c. as might be expected, based on the freight differential. There is, however, no demand and no business at these levels. The opinion is expressed that the market may have to seek lower levels before there is any revival of interest. Stocks of lead in Great Britain on January 1 are officially given as 62,852 long tons.

TIN

The market is extremely dull and there seems to be no prospect of its improving soon—not until the restricted conditions are removed. The re-sale or second-hand offerings, mentioned last week, are still unabsorbed and this fact reinforces the assumption that the United States Steel Products Co. is not getting rid of its allocated tin which it holds at the fixed Government price of 72.50c., New York, because the cheaper lots would be taken first. These are held at about 71.50c., New York, which we quote as the nominal market. Tin from American smelters, 99% pure, is offered at 67.50c., New York, while at last accounts metal for shipment from the East is offered at 53c. delivered. These contrasts in price with the fixed one are a source of discontent in the trade. The Tin Importers Association is receiving many responses from tin consumers to its circulars setting forth these facts and pointing out the harm being done to the trade in all its phases by the continuance of this control, and urging a campaign among Congressmen looking to legislation to open the market again as soon as possible. In London, spot Straits tin is quoted at £225 10s. per ton.

ZINC

The market is again lower and the tendency has been downward nearly each day. There has been no improvement in demand, but there has been competition by some interests for the little business going each day. Prime Western for January and early delivery is quoted at 7.25c., St. Louis, or 7.60c., New York, with the leading producers uninterested and refraining from quoting. For February and March delivery, quotations are about 7.12½ and 7c., St. Louis, respectively. An increase in stocks of all grades is shown by the weekly Government report for the week ended January 4; this fact is not a bull factor. England's stocks of zinc on hand January 1 were 22,273 long tons.

ORES

Antimony: No developments in this ore.

Chrome: The War Trade Board announces that applications for licenses to import chromite will be considered, provided shipments were actually in transit on November 11.

Manganese Alloys: It has been officially announced that any British ferro-manganese sold to American consumers prior to April 6, 1917, will be allowed to be imported. It is estimated that 25,000 to 27,000 tons is involved, most of which was sold at from $164 to $185 per ton, seaboard. There is no demand for domestic 70% ferro for which $225 per ton, delivered, is asked.

Molybdenum: There has been more activity, particularly in small lots, which have sold at 80c. per pound of MoS_2 in 90% material. Quotations range from 75c. to $1 per pound.

Tungsten: Buyers are still awaiting developments and the market continues dead. Quotations are entirely absent because of the lack of even an inquiry to test the market. The same is true of ferro-tungsten. Consumers of both concentrate and alloy are apparently fully supplied.

Quicksilver Production in 1918

The domestic output of quicksilver in 1918, according to statistics compiled by F. L. Ransome, of the United States Geological Survey, was 33,432 flasks of 75 lb. each, valued at the average quoted market price at San Francisco ($117.92 a flask) at $3,942,301. Compared with the output in 1917 of 36,159 flasks, valued at $3,808,266, this shows a decrease in quantity of 2727 flasks but an increase in value of $134,035.

The productive States were California, Texas, Nevada, Oregon, and Idaho, named in the order of decreasing importance.

The production of California was 23,231 flasks, against 23,938 flasks in 1917, a decrease of 707 flasks. As usual of late years, the New Idria mine, with which is included the San Carlos mine, yielded nearly half of the total output of the State. Its product was greater than in 1917, and exceeded that of any other year in its history except 1867 and 1868. No other old quicksilver mine in California has so well sustained in recent years a production comparable with that of those early years when quicksilver mining in California was in its prime. Only one other mine in the State, the New Almaden (which includes the Senator mine), produced over 2000 flasks in 1918. New Almaden has produced to date 1,124,100 flasks, and in 1865 alone yielded 48,138 flasks from ore that yielded 11.3% of quicksilver. In total production, New Idria, with 315,434 flasks to the end of 1918, ranks second, and Oat Hill (Napa Consolidated), with 140,000 flasks, comes third. The New Guadalupe, Oceanic, Sulphur Bank, Aetna, and Cloverdale mines each produced over 1000 flasks in 1918; and the St. Johns over 500 flasks. Other mines that yielded less than 500 but more than 100 flasks are the Great Eastern, Socrates, Culver-Baer, Helen, Big Chief, Patriquin, and Cuddeback.

Sulphur Bank nearly trebled its output of the previous year and probably would have made still larger gains were it not for the fact that the high sulphur content of the ore renders furnace treatment and condensation difficult. The Rutherford mine, in Napa county, formerly known as the Bella Union, became productive in 1918 after a period of idleness. A rotary furnace is being put up near-by, and this mine should increase its output in 1919. The Big Chief, near Anderson Springs, Lake county, is a new mine, opened on a body of ore that was discovered at the beginning of the year. The ore extracted has been reduced in the retorts of the neighboring Big Injun mine. The Patriquin mine (formerly the Cholame), in Monterey county, after a period of successful operation with retorts, has been for the time abandoned, and the operations of the Patriquin Mining Co. have been transferred to a hitherto undeveloped deposit about 2 miles from the 20-ton Scott furnace formerly operated by the Kings Quicksilver Mining Co., in Kings county. To this furnace, which is reported to be in excellent condition, the ore from the new mine is hauled in motor-trucks. Prospecting at the Oat Hill mine was carried on during the year, but no quicksilver was produced. The Cloverdale mine, under new management and in spite of an unsatisfactory furnace, notably increased its output in 1918.

In general, quicksilver mining in California maintained fairly well during the year the revival of activity due to the War, as indicated by comparison of the output (33,432 flasks) with the production of 11,303 flasks in 1914. A large number of mines that were formerly productive have remained idle, however, and with the gradual return to normal conditions other mines are likely to revert to this class.

The output of quicksilver in Texas was 8475 flasks, against 10,791 flasks in 1917. The Ellis mine, near McKinney Springs, considerably increased its output; and the Mariposa mine also made a small gain. The output of the Chisos mine, however, declined, and that of the Big Bend showed a still larger falling off. The Big Bend has been nearly exhausted down to the level of the underground water, so that pumping and additional development will be necessary if any considerable output is to be maintained. Prospecting has been continued by the Rainbow Mining Co. on the westward continuation of the Chisos ore-zone, and some ore is reported to have been found

Nevada produced 1023 flasks, the greater part of which was obtained by the Mercury Mining Co., operating near Ione, in Nye county. The remainder came from small mines in Mineral county, particularly in the Pilot mountains east of Mina and on Mount Montgomery. No output was made by the Goldbanks Quicksilver Co., in Humboldt county. As the production of Nevada in 1917 was 997 flasks, the yield for 1918 shows a small increase.

Oregon produced 673 flasks in 1918, chiefly from the Black Butte mine, but also from the Ranier mine, in Jackson county, which was not in operation in 1917.

No production was reported from Arizona or Washington.

When, in 1917, the Government requisitioned 40% of the output of the principal mines at the price of $105 per flask, an agreement was reached with the producers that quicksilver would not be sold in the open market at more than $125 per flask. The average quotation in San Francisco was $128.06 in January 1918, but declined to $118 in February and $112 in March. It rose to $115 in April, but fell to $110, the lowest monthly average for the year, in May. In June the average quotation was $112, and from July on it has stood at $120.

Quicksilver imported for consumption in the United States for the six months ended June 30, 1918, amounted to 261,879 lb., or 3491 flasks, valued at $365,930. In the 11 months ended November 30, 1918, the exports amounted to 216,770 lb., or 2890 flasks, valued at $313,272.

With the return of peace and a decrease in the Government demand for quicksilver for military purposes, the quicksilver-mining industry, faced with uncertainty as to the future, already shows signs of declining, and unless prices are kept up by some Government action or unless there is a decided fall in the cost of labor and supplies, this decline will probably be rapid in 1919. The exigencies of war have failed to bring to light any large new sources of supply, and it is clear that the output of 36,159 flasks in 1917 marks the maximum response of which the known deposits are capable, even under the unusually stimulating conditions of that and the immediately preceding year.

Arsenic Production in 1918

There was available for consumption in the United States during 1918 approximately 12,000 short tons of arsenic, which quantity about equals the estimated demand and is 3850 tons greater that the average yearly supply (8150 tons) for the period 1911-1916, inclusive.

The domestic production of arsenic in 1918, as estimated from the known production during 11 months, was about 6395 short tons and was made by four companies. This quantity is 10% greater than that produced in 1917. The value of the output in 1918 at a price fixed at 9c. per pound was $1,151,100, but the actual value was probably slightly greater, as that price was not fixed until February 1918. Owing to the lower price fixed under governmental regulation this value is lower by $150,000 that the value of the 5826 tons produced in 1917, according to J. M. Hill.

The imports of arsenic for the first 11 months in 1918 were 5048 short tons, 3480 tons of which came from Mexico, 1566 tons from Canada, and the rest from England and Australia. The total imports for the year will be 5600 tons.

Book Reviews

Topographic Stadia Surveying. By C. E. Grunsky. Pp. 95, ill., index. D. Van Nostrand Co., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $2.

This book comprises a discussion of the theory and practice of stadia surveying together with reduction tables for both horizontal and vertical distances and a reduction chart. The surveyor that wishes the data on this subject in a compact form with no additional matter will find the book of value.

Introduction to Organic Chemistry. By J. T. Stoddard. Second edition, revised. Pp. 423, index. P. Blakiston's Son & Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press'. Price, $1.50.

Organic chemistry is the chemistry of the compounds of carbon. The number of compounds that contain carbon is very large, and those who wish to get an insight into the C-H-O series will find everything discussed in this work. Their study is naturally rather highly technical. Cyanide and flotation men will find notes on cyanides and oils, these substances being compounds of carbon.

Mill and Cyanide Handbook. By A. W. Allen. Pp. 128, charts, index. Charles Griffin & Co., London, and J. B. Lippincott Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press'. Price, $2.

The author of this little work has had considerable experience in gold and silver ore treatment in Africa, Australia, Mexico, and South America. Along with much research, he has been particularly observant and kept copious notes, many of which appear in the book before us. While essentially a compilation—there being no discussions of methods—the mill operator will find the comparative data he needs in short tables, a somewhat unusual arrangement. Some of these cover lime and caustic soda, oxidizing agents, conversion factors, decimal equivalents, capacity of leaching and solution tanks, screens, testing for alkali and cyanide, crushers, stamp, ball, and tube-mills, filtration, recovery of precious metals, and the conveyance of ore, pulp, and solution. The 21 pages of treatment flow-sheets give as many process from ore to bullion, from pulp to bullion, and from precipitate to bullion. These are very clear, the important points in the charts being in capitals. The next 19 pages consist of report forms of all departments in mills. A new glossary of mill and laboratory terms completes a reliable and practical handbook for the millman's desk.

Handbook of Mathematics for Engineers. By Edward V. Huntington and Louis A. Fischer. Pp. 186, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $1.50.

This is a re-print of sections 1 and 2 of Marks' 'Mechanical Engineers' Handbook'. The first section contains mathematical tables, such as squares and square roots, cubes and cube roots, areas and volumes, logarithms, radians, trigonometric functions, reciprocals, hyperbolic logarithms and other hyperbolic functions, and interest and annuity tables. It also contains tables of weights and measures, both common and metric, work and energy units, Baume degrees, and miscellaneous conversion tables. While some of the tables are not arranged in the manner most familiar to engineers, a little practice should make anyone accustomed to them. The second is devoted to mathematics, the various divisions being arithmetic, geometry and mensuration, algebra including determinants, trigonometry, analytical geometry, differential and integral calculus, graphical representation of functions, and vector analysis. In the small space that is available, little except rules and formulas can be given, there being little room for explanations. This part of the book is therefore of value mainly as a reference book for the engineer who has forgotten only part of his college mathematics, rather than for the man that has forgotten all, or nearly all of them. The book's principal value lies in the fact that all the material it contains is not available elsewhere in this convenient pocketbook form.

Handbook of Machine-Shop Electricity. By C. E. Clewell. Pp. 447, ill., index. McGraw-Hill Book Co., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $3.

The use of electricity in the machine-shop both for lighting and for power has become so general that there is need for a convenient handbook for the use of managers and foremen. This need is met by the present volume. The language is as non-technical as is possible for a book of this character, and, while it could hardly be used as a textbook, the book will be serviceable to men of relative little technical education along these particular lines. The divisions of the book are as follows: Abbreviations, Terminology, and Units; Circuits, which includes wiring for both direct and alternating current; Costs, mainly pre-war, but some of them, unfortunately, are not dated; Communication and Distant Control; Current Supply, Generators, and Transformers; Electro-chemical, Soldering, and Welding; Heating and Magnetic Apparatus; Lamps and Shop-Lighting; Measuring Instruments and Measurements; Motors.

SALE OF GOVERNMENT EQUIPMENT

Ten million dollars worth of equipment owned by the United States Spruce Production Corporation, with headquarters at Portland, Oregon, is to be sold, and sealed bids for the same will be received by the sales in the Yeon building in that city up to and including February 15. Members of the sales board, appointed by Brigadier-General Brice P. Disque, commanding officer of the corporation, are Major Watson Eastman, president, Captain I. D. Wolf, Captain H. C. Eustis, and Lieutenant Louis P. Pink, the last being recorder. This great organization during its operations directed the activities of 130,000 men.

The equipment, which consisted of everything from picks and shovels to complete railroads and mills, capable of producing stock from the huge tree in the forest to the finished plank ready for shipment to the airplane factory, is in excellent condition and much of it was never used because of the abrupt ending of the War. The plant has been stored at Vancouver, Washington, where it may be inspected by interested persons, upon proper certification by the board in the Yeon building at Portland.

MINING DECISION

Mining Option—Effect of Failure in Payments

A contract to convey mining claims that binds the holder thereof neither to make the specified payments nor to do or perform any of the acts stipulated therein to be performed by him except during the life of the agreement, and that expressly gives him the option either to comply with its terms or forfeit the 'option', is merely an option contract. The holder is not a purchaser but merely the owner of an option. If he does not live up to the terms of his option in making payments, the owner of the claims may not only repossess himself of the property, but may also enforce the right to retain the mining machinery and equipment placed thereon by the delinquent purchaser if such right was given him under the option. The owner does not have to rescind the contract in order to sue the option holder for such recovery.

Smith v. Beebe (Idaho), 174 Pacific, 608. June 26, 1918.

EDITORIAL

LAST year the Rand produced 8,416,000 fine ounces of gold, worth $173,958,720. This is the lowest output since 1914 and compares with 9,022,263 ounces in 1917 and 9,295,538 ounces in 1916. An epidemic of influenza affected production adversely during the last quarter of 1918.

THE 119th meeting of the American Institute of Mining Engineers will be held at New York on February 17 and 18. One joint session will be held with the American Institute of Electrical Engineers and two joint sessions with the Canadian Mining Institute. A delegation of Canadian engineers is expected and it is proposed to emphasize the fraternization of the two neighboring and neighborly peoples in dealing with after-the-war problems.

MOLYBDENITE has been found at a depth of 1320 feet in the Silver Pick mine at Goldfield. Mr. G. F. Dyer, the superintendent, informs us that the molybdenite occurs in quartz veins traversing the alaskite and has been followed for 135 feet in depth, a thickness of 72 feet, and a length of 100 feet. The average content is 2% molybdenite, and with it are found gold and silver, up to $75 in value, but sporadically. It remains to be ascertained, by exploration, whether this is an orebody or a mineralogic eccentricity.

WE note a paragraph in a local paper praising the work done by the geologists of California under the auspices of the State Council of Defense in finding supplies of chrome, manganese, and other war-minerals. Reference is made to the survey of our State resources made by Mr. George D. Louderback, professor of geology in the University of California. We happen to know how conscientiously and effectively he labored in the good cause, co-operating with the Bureau of Mines and the Geological Survey in a manner and with a spirit that do him infinite credit.

MINERALS SEPARATION, in trying to enjoin the Butte & Superior from disposing of its assets pending action on the mandate of the U. S. Supreme Court, followed the old tactics of claiming everything in sight, namely, the $18,000,000 of total profit made during the 12 years in which the Butte & Superior company has been engaged in mining and milling operations. More than once Minerals Separation has tried to collect royalty on all the ore that goes to a mill, even when only a fraction of it is subjected to flotation. They have tried to levy toll on ore that has been hand-picked, jigged, concentrated on tables, and so forth. It is this greedy policy, plus attempts to bulldoze the profession, that has developed a general dislike of them and of the incubus they hope to place permanently on the mining industry.

PLATINUM on the Pacific Coast is associated with chromite, ilmenite, magnetite, and various silicious minerals, the aggregate constituting what is known as 'black sands'. The U. S. Bureau of Mines, through one of its staff, Mr. R. R. Hornor, has recently investigated some of the more promising localities in Coos, Curry, and Josephine counties of Oregon, and in Del Norte county, California, to ascertain whether the deposits were valuable enough to exploit for platinum and gold. The Bureau now reports, in Technical Paper 196, that "in general the black-sand deposits are disappointing in both value and quantity; they rarely contain enough gold and platinum or occur in adequate quantity to be exploited at a profit. There are, it is true, a few favored places where small areas of the black sand show some precious-metal content, and these may become the site of small operations . . . The chief difficulties in the profitable exploitation of these deposits are: first, lack of uniformity in occurrence and metallic content, and, second, the high cost of mining and treating the material. . . ." This conclusion should once and for all settle—*pace* Dr. David T. Day—the many reports of rich black sand along the coast of California and Oregon.

ENGINEERING knows no boundaries, natural or strategic. It is interesting to note that a San Francisco firm of engineers, Bradley, Bruff & Labarthe, has been retained by the Penarroya Mining & Metallurgical Company to design a complete smelting and refining plant for the company's properties at Penarroya, in Spain. The company itself is French and has its headquarters at Paris. In our issue of October 12 we published a summary of the annual report of this famous enterprise, which in 1917 marketed 7,715,354 ounces of silver, 330,708,400 pounds of lead, and 3,740,600 pounds of zinc. The company owns large coal mines and a fleet of cargo-vessels; it is operating a new smelter at Marseilles and is engaged in mining and metallurgical operations in Algeria and in Tunis. In 1917 it distributed $2,350,000 in dividends to its shareholders. We are informed that the new smelting equipment will include the usual crushing and sampling machinery, multiple-hearth roasters and Dwight-Lloyd sintering machines, four large blast-furnaces for smelting lead ore and one blast-furnace for copper ore, also a lead-copper matte-converting plant, a complete zinc desilverizing lead refinery, and lead manufacturing machinery. The furnaces will be fired with pulverized coal. We hope to publish a detailed description of this smelter at a later date.

SEVERAL telegrams and letters have come to us in regard to the preventive of influenza, namely Calcreose, the use of which was described in our issue of January 18. As we have stated in an editorial note appearing in the same issue, this prophylactic can be obtained from the Maltbie Chemical Company, of Newark, New Jersey. We find now that Wakelee's Pharmacies in San Francisco have it in stock, for instance, at 58 Market Street. The author of the article is Dr. C. T. Baldwin, of New York. Calcreose can be obtained in tablets, but the better form is in powder, from which any druggist can prepare the medicine in 24 hours, in the proportion of one pound of Calcreose to one gallon of water. The dose is one teaspoonful in a wine-glass of water every four hours as a preventive, and two to four teaspoonfuls every two hours for influenza or pneumonia. The No. 2 tablets contain four grains of Calcreose powder, with a little iron, arsenic, and strychnine, as a tonic for use during convalescence. Dr. Baldwin says he is "increasingly sure that the solution is an efficient prophylactic against influenza. It enables the physician to control the septic conditions not only in severe influenza but even after pneumonia has developed it so modifies the infection and toxemia as to enable the physician to treat pneumonia successfully."

Another Gold Report

We have received a copy of the report of the committee, under the chairmanship of Lord Inchcape, appointed to advise the British government on the policy of aiding the production of gold. The terms of reference were as follows: "To consider and report upon the effect of the War upon the gold production of the British empire, with reference more particularly to the treatment of low-grade ores, and how far it may be of importance to the national interests to secure the continuance of the treatment of such ores and generally how to stimulate the production of gold." The report can be summarized in one word: No. The committee answers in the negative to every suggestion embodied in the terms of reference. It finds that the production of gold in the Empire did not decline during the period of the War, as compared with the corresponding period immediately preceding. The lessened output of the Transvaal in 1917 was due, it is stated, to a shortage of explosives, although shortage of labor was a contributory factor, but this was not due "to any large extent" to the War. The tonnage of low-grade ore treated in the Transvaal has not been diminished by the War. The decreased exploitation of low-grade ore, in favor of richer ore, "will not within any measurable period reduce the output of the Empire" and the continued working of low-grade mines therefore is not "of any great importance to the national interests." The decline in Australasia was "normal and due in the main to natural causes" aggravated by increased costs and deficiency of labor caused by the War. The report concludes by refusing to recommend "any bounty or subsidy for the purpose of stimulating the gold output; gold being the standard of value, no more can properly be paid for it than its value in currency." These findings will disappoint the mining community in London, at Johannesburg, and at Melbourne, because they seem to ignore several fairly obvious facts, such as the fluid price of gold in terms of paper currency. Moreover, whereas normally the commodity value of gold is regulated by the laws of supply and demand, it is patent that the War introduced abnormal conditions, of which the most unfortunate was the lavish issue of paper money, in the form of notes and bonds, by the belligerent governments. This interfered directly with the demand for gold, even in countries where gold was not immediately commandeered. Opportunity for further argument remains, especially in regard to the working of low-grade mines. Even a mine that yields no profit is beneficial to the community, and to the nation, because it affords employment and furnishes training to those connected with it; moreover, whether the gold produced be won at a profit or not, it vitalizes the arteries of commerce. The Committee, we venture to say, shows a narrow imagination and possibly lack of knowledge in dismissing the low-grade mines so bluntly. With one of the Committee's incidental observations we agree: "The gold producers have argued that the unavoidable expansion of currency by the issue of currency notes has raised prices against them unduly as against the producers of other commodities who have been able to obtain higher prices for their products, but it is to be remembered that the gold producers have always had the advantage of the standard price of their product during the periods when the price of other commodities has fallen." That is true, and in the backward swing of the pendulum the gold miner will find, we trust, a corrective for the disadvantage under which he has had to labor during the last four years; always provided that the swing of the pendulum is not checked by artificial restraints, such, for example, as the proposed international pool for obviating the necessity for shipping gold from country to country whenever trade-balances have to be settled. The Committee was assisted by the technical advice of Mr. William Frecheville, Professor of Mining in the Royal School of Mines. His review of gold mining in the British empire is given in an appendix to the report and we shall publish it at the earliest opportunity.

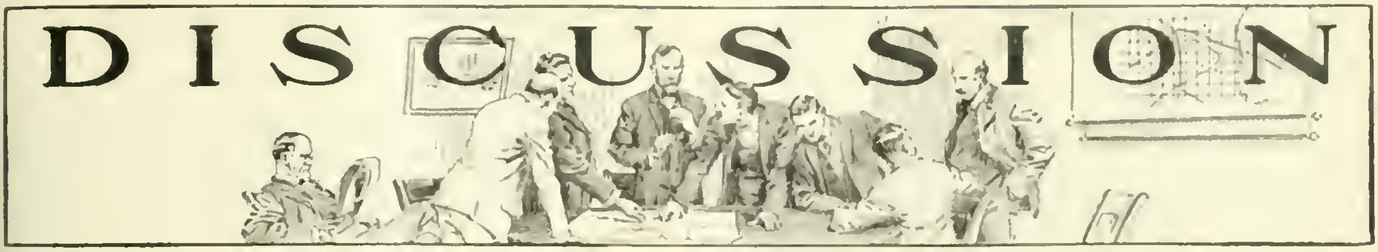
Mining v. Bolshevism in Russia

The impact of Bolshevism on mining in Siberia was described recently in London by the chairman of the Irtysh Corporation when addressing the annual meeting of the shareholders. This holding company, formed soon after the commencement of the War, is an outgrowth of the Russo-Asiatic Corporation, which, in 1912, acquired the Ridder concession, covering 1600 square miles, and the Ekibastus coalfield in the Altai region of Siberia. As Mr. Leslie Urquhart, the chairman of this company, said, at the meeting, with pardonable pride, there has been built a great industry, in spite of many difficulties, so that at the end of 1916 an output of finished metals was being made from the ores mined at Ridder and smelted at Ekibastus, these two points being joined by a broad-gauge railroad 90 miles long. In March 1917 the revolution in Russia created troubles exceeding those arising from the War, yet the company completed its plant for extracting the lead, silver, and gold in its ore, so that it is now prepared to deliver zinc, lead, silver, gold, and copper on the market. Under normal conditions this enterprise would have reached the productive stage earlier, but late in 1917 the deleterious effects of Bolshevist activity among the workers was apparent and the interference with operations became a severe handicap. The management decided to curtail operations gradually without exciting too much attention from the Soviets. Not until 1918, however, did the Red Guards of the Bolshevist regime obtain control of the Trans-Siberian Railway. Then by aid of the German and Austrian prisoners of war they seized this continental artery of transport, but by that time the policy of closing-down had been carried out both at the metal and coal mines. In May the Bolshevists attempted unsuccessfully to work the Ekibastus collieries. The company's workmen, particularly the Kirgiz, who are the Turkomans, of pastoral and nomadic habits, refused to work for the Bolshevists. In order, however, to prevent the scattering of skilled labor, a portion of the staff remained on the ground and employed a force sufficient to operate the machine-shops, foundries, and the company's branch railways, one 75 miles long to Ust Kamenogorsk, on the Irtysh river, and the other 90 miles long, to Ekibastus, in the province of Semipalatinsk. This prevented theft and sabotage. The Bolshevists were in power for only a few months in Siberia, from February to May, by which time bands of Czecho-Slovak prisoners of war, aggregating 50,000, broke away from the mob of anarchists and joined the opposition. By the end of June these Czecho-Slovaks, aided by Cossacks and others, had driven the Bolshevist forces out of western Siberia. They joined the Russians under Semenoff and their own compatriots in eastern Siberia, so that by August the whole country from the Volga to the Pacific was rid of Bolshevist domination. In August the company resumed the production of coal at Ekibastus and in November coke was being made once more. Owing to the high local prices then prevailing this production proved extremely remunerative. The lead plant is about to be re-started, because the demand for shot is acute and this branch of the company's business should also be highly profitable. It is deemed inopportune to make zinc at present, owing to the closing of outlets to the markets for that metal. The mill at Ridder will treat the old dumps and also the gold ore from the Sokolni mine, but the Ridder mine itself will not be unwatered just now. The company's steamers on the river Irtysh are being overhauled preparatory to navigation this spring and when again in operation this traffic should yield a substantial revenue. In short, the policy of the management has been to feel its way and to start such departments as can be made immediately remunerative. The labor question is crucial. A persistent effort has been made by the company to provide for the comfort of the workmen and their families. Colonies of dwellings, with proper sanitary arrangements and an adequate supply of water, fuel, and light, have been provided; likewise co-operative stores, vegetable gardens supplying their products at cost-price, schools, churches, clubs, and hospitals have been established. This has been done both at Ridder, where the metal mines are, and at Ekibastus, on the coalfield. The company has introduced labor-saving appliances and pays comparatively high wages. This liberal policy has attracted good workers and created cordial relations between the management and the men, as is proved by the fact that the latter continued to work for four months without wages, asking only to be provided with food, and they refused to work for the Bolshevists. At the coal mines 80% of the men are Kirgiz; they are intelligent and tractable. The Russian managers and chiefs of staff have proved loyal and capable during the times of stress. The metal mines are estimated to contain 3,534,000 tons of ore in reserve; from this a profit of $65,000,000 is anticipated. At Ridder a concentrating mill and sulphuric acid works are in operation. The coal mines are producing 150,000 tons per annum. At the collieries are the smelters, with a capacity of 15,000 tons of refined lead and 5000 tons of refined spelter per annum, and with more than ample capacity for extracting the accompanying precious metals. Evidently this is a large, diversified, and exceedingly interesting enterprise. Messrs. R. Gilman Brown, Thomas J. Jones, and William C. Madge are the engineers to whom the credit for the technical work is due, but the big task of organization and direction is largely in the hands of Mr. Urquhart, who knows Russia intimately and has been at the back of the more important part of recent British mining undertakings in Siberia. The Kyshtim and Tanalyk corporations, two enterprises with which Mr. H. C. Hoover was connected at the start, were more exposed to Bolshevist misrule because their properties are nearer European Russia. In December 1917 the Kyshtim plant was 'nationalized' by decree of the Soviet; it was operated by a Workmen's Committee until May 1918, when the Czecho-Slovaks routed the Bolshevist forces near the town of Kyshtim. The Provisional Government re-started operations and later placed one of the company's general managers in charge, the works themselves not having been damaged during the interregnum. The establishment is now being re-organized and the company resumes, as regards title, its former status. After such an orgy of disorder it is difficult to restore former conditions, but as the new government of Siberia becomes strengthened it will be easier to repair the normal economic life of the country. This is now being done in places. The new government, according to Mr. C. J. Cater Scott, the chairman of the Kyshtim Corporation, "has gained the support of experienced public men in the country who have hitherto been reluctant to join any of the experimental administrations." Among them are men in whom he and his co-directors have unlimited confidence. It is important to note that the Siberian government "has recognized its liability for damages and financial expropriation or loss caused by the Bolshevist regime, and when the proper time comes a claim will be preferred by the company for restitution of materials and funds expropriated by the Bolshevists." We quote Mr. Cater Scott, who also stated that the Kyshtim enterprise is capable of producing from 12,000 to 15,000 tons of copper per annum. It has a sulphuric acid works of 8000 tons capacity per annum, a dynamite plant of 1200 tons capacity, and a plant to produce 4000 tons of copper sulphate annually. At the Tanalyk mines, which are in the Ural region, the production of copper, gold, and silver proceeded profitably, thanks largely to the premium obtainable in Russia for all metals, until the close of 1917, when the Bolshevists seduced the younger men among the Russians employed, but failed to mislead the Bashkirs, Mussulmans of Tartar origin, who constitute the native population and the main supply of labor in this region. It is from them that the Tanalyk properties are held under a lease of 76 years, and to them that the company pays a royalty. In March 1918, thanks to the Bashkirs, the mines were freed of the anarchists and later the representatives of the provisional government of the Bashkir community-lands, with headquarters at Orenburg, established an office at Tanalyk. These agents of the new government have shown the most friendly and helpful attitude to the company. Owing to the difficulty of obtaining supplies, such as mercury and cyanide for the mill and coke for the smelter, it is not practicable to resume operations on the maximum scale, but productive work is in progress and the opportunity is being taken to push the construction of a branch railway to connect with the main line. The ore in reserve is valued at $5,000,000. At the Tanalyk meeting Mr. Urquhart recorded his conviction that Russia will soon recover herself, if only the Allies will give a helping hand. He protested against the irresponsible scaremongering that was causing the world to exaggerate the resources of the Bolshevist regime, he pointed to signs of a healthy reaction, and expressed a confident hope that the influence of civilization would assert itself before long. It seems worth while to give this authentic information concerning the experience of typical foreign enterprises in Siberia because it affords direct light on the industrial conditions obtaining there. We note with pleasure that the San Francisco Chamber of Commercial Activities is endeavoring to keep in touch with Russian business. This is useful work, for we look forward to the re-establishment, on a broader basis, of trade between San Francisco and the Russian republic—or republics.

Independence in Minerals

On another page we publish an article on a most timely subject by Mr. George Otis Smith, Director of the U. S. Geological Survey. This article, we believe, is intended as a preface to the forthcoming volume of the 'Mineral Resources'. It is well worthy of the chief of a scientific bureau to which the mining industry has been indebted for aid and guidance since it was first organized by Clarence King in 1879. He reviews the market for mineral products during the War and shows how it reacted to economic laws, creating new demands to which the industry responded. He gives several striking illustrations of the unexpected economic value discovered in scientific researches that at the time they were made seemed to serve no utilitarian purpose. Recent experience has proved how the geologist has developed—how he had to develop—from the academic student of Lyell's and Murchison's time to a pioneer of commerce; he has been required to submit his work to the test of economic usefulness, and he has succeeded triumphantly; he has become a real partner to the engineer and the capitalist, and they appreciate his comradeship. Together they study the conditions governing the exploitation of mineral deposits. We like Mr. Smith's analysis of the various factors influencing successful mining. He utters a timely warning when he says, "a nation that robs its domestic consumers so as to have an exportable surplus or to sell that surplus at a price below cost will be copying a German blunder in economics." Our home market should always be given precedence, not only on plainly patriotic grounds but out of regard for the welfare of the mining industry itself. Although before the War we were producing a third of the world's output of essential minerals, as soon as international trade was disorganized we had to face an unexpected shortage of many minerals for which theretofore we had looked abroad. The list of such minerals is comparatively small and of some of them we have developed a supply under the spur of necessity. It remains for us to appreciate the strategic value of being wholly independent of foreign supplies and to stimulate the development of the deposits of such minerals as are lacking for our national industries. A survey of the elements of this problem is needed at once, in order to guide possible legislation. The matter must be placed in trustworthy hands, for the experience of war-time has shown how the market for certain mineral products is controlled by small groups having many of the unpleasant features of a selfish monopoly. Such control of the market is today the chief menace to independent activity in exploring for the few minerals inadequately produced in this country.

DISCUSSION



The Status of Gold

The Editor:

Sir—In this and other periodicals I have read some dozens of articles dealing with the gold situation. It would seem that the need for a greater gold supply is so clearly apparent that no further argument on that score should be necessary. Thus far I have failed to see in any of these articles a clear statement as to the extent to which the gold supply could be increased. This may be due to the fact that it would be extremely difficult to make such a statement with any degree of accuracy. So many factors would have to be taken into consideration that even the most skillful of statisticians would be hard put to it to arrive at anything more than an approximation.

It may be said that the three principal uses for gold are (1) to lend stability to government obligations, (2) to back up currency, (3) to adjust trade balances, internationally and infra-nationally. Obligations have been increased tenfold and new currency has been issued freely, while trade balances have been dealt with in so unheard of a manner that we shall not know just how they stand for some time to come.

The fact is that at this time we have dependable information only as to the extent of national obligations, and about the only way in which a conclusion that will be at all illuminating can be arrived at is to strike a ratio between gold-supply and government obligations as the same existed prior to the War, and apply it to present conditions. Thus we find that in 1914 the total indebtedness of all the nations that subsequently engaged in the War was approximately $28,000,000,000, and that the total gold-supply which these governments could lay hand to at that time was something more than $9,000,000,000. The ratio of gold-supply to indebtedness, therefore, was just about 1:3. The total indebtedness of belligerent nations, figured to the end of 1918, will exceed $160,000,000,000. Assuming that the $9,000,000,000 pre-war gold-supply remains intact, and that every ounce of gold produced in the world during 1915-'16-'17-'18 is added, the total available gold-supply is now $10,720,000,000. This allows $380,000,000 for the 1918 production. The ratio, then, between gold-supply and indebtedness is now 1:15, instead of 1:3. There is to be superadded to this $160,000,000,000, probably $120,000,000,000 which Germany must pay to the Allies, bringing the total national debts of belligerent nations to the neat sum of $280,000,000,000, and fixing the ratio at 1:26.

As a side-light, look at the accumulated interest. The $160,000,000,000 is payable, principal and interest, in gold. Interest at 4% is $6,400,000,000 annually. On the $280,000,000,000 it would be $11,200,000,000 per year. The world's annual gold production is less than $400,000,000, or 6¼% of the interest payable on the $160,000,000,000 and little more than 3½% of the interest on the $280,000,000,000.

To place the nations on a pre-war basis as regards gold-supply and indebtedness we would require a reserve of $53,000,000,000, and an annual production of $2,400,000,000 when we limit the obligations to $160,000,000,000, or a reserve of $93,000,000,000 and an annual production of more than $4,000,000,000 if we take these obligations to be $280,000,000,000. On its face the foregoing may appear to be a *reductio ad absurdum*, but it serves a purpose. It shows that, no matter how ingenious the financing, it is going to be most difficult to stretch our present gold-supply sufficiently to meet all requirements. It must be borne in mind that legislation cannot bring gold into existence. The world has been quite thoroughly prospected and the outlook for the discovery of new goldfields of importance is not particularly encouraging. Hard-headed financiers can scarcely proceed upon the assumption that such discoveries will be made when the fact is that existing gold mines are being exhausted much faster than new ones are being found. We must also remember that gold disappears. Possibly the total production of fifty years past might be accounted for, but the world has been producing gold for thousands of years. It seems reasonable to believe that, at the low rate of production now obtaining, about as much gold will, for all practical purposes, become non-existent as is brought into existence. This would leave us with some 500,000,000 ounces, which must back all national obligations and all currency, supply the requirements of trade and the arts, and generally act as the standard of measurement for all wealth. It would certainly appear that the superstructure of credit that must be built upon this small supply, figured at its present monetary value, might be in danger of becoming top-heavy.

Possibly, if this $10,000,000,000 in gold were held solely as a reserve to protect government obligations, some color of stability might be lent such obligations. But governments cannot hold all of the gold in reserve. In order to do so every nation which has any gold must place a strict embargo on its export. During war-time such an embargo may be enforced because trade is not following the usual channels but in times of peace such an embargo would mean no trade. That would spell general ruin, regardless of whether a nation were or were not well supplied with gold. The ability of the world to rid itself of its enormous burden of debt depends upon unrestricted commerce. Large gold-shipments have always heretofore been necessary in order to adjust credits, both foreign and domestic. Gold is so used because it has a standard value throughout the world, and because such value is great in proportion to its bulk and weight; in fact, this is the most important of the three principal uses for gold, and if commerce is denied this convenience in the future it will be most seriously crippled.

All of these conditions considered together seem to imply that either the monetary value of gold must be increased, or gold must take a partner, or else that both of these things must be brought about. If it is at all possible to make a change in our monetary standards, now is the accepted time. That it is possible seems proved by the fact that, in 1812, England alone did arbitrarily declare the price of gold to be 85 shillings an ounce, and that the world accepted her valuation. The net result of the world-war has been to seat the English-speaking peoples firmly in control of world policies. Great Britain and the United States of America hold absolute control of all gold, whether mined or unmined. Together they command all avenues of trade and can aid or ruin other peoples at their will. We may all be truly thankful that such unlimited power rests with nations which may be trusted to work out the rehabilitations of the world. Surely what England, alone and unaided, accomplished a century ago, can now be done by England and the United States together.

Three things these two must do. They must see to it that the integrity of the obligations of *all* nations is guaranteed. Being themselves the heaviest creditors, it particularly behooves them to do so. They must be certain that currency is backed by an ample supply of standardized metal. They must provide commerce with a supply of gold commensurate with the volume it is sure to attain. To go about it in a manner which is but a temporary makeshift is lacking in dignity and does not discharge the duty which we owe to present and future generations. A subsidy on newly-mined gold may relieve the gold-miner of an unjustly sustained burden and it may increase production a few percentages, but the increment will be slow and of future value, while our needs are present and imeprative. With all due diffidence toward those who now have the matter in hand, I would venture to suggest the following:

1. That all gold be called in and paid for at $20.6718 per ounce, and that all silver be called in and paid for at $1.015 per ounce. The manner of payment is inconsequential, but it might be made by the issuance of Treasury certificates payable at a certain date in legal tender as provided at that date.

2. That the monetary value of gold be fixed at double the present, that is, at $41.3436 per fine ounce, and at the same time that silver be standardized at a ratio of 20:1 or at $2.06718 per fine ounce.

3. That all newly-mined gold and silver be paid for at the newly established prices.

4. That all metal so accumulated be coined as needed, that not required for coinage to be retained in bar form.

5. That all coin be released freely as called for from any quarter of the globe.

As a matter of course proper precautions should be taken against fraud, both as regards retention of metal called in and as regards proof or origin of newly-mined metal. It is no more difficult to do this than it is to prevent other frauds that are constantly being attempted. Special provisions might be made to apply to articles of sentimental or useful value.

Some may consider the increases in price above suggested too great, but are they? We might count on an accumulation of 600,000,000 oz. of gold, which, in round numbers, would have a value of $25,000,000,000. We might also count on 5,000,000,000 oz. of silver, which would have a value of $10,000,000,000. The value of all standardized metal would then be $35,000,000,000. The annual production, allowing for an augmented supply, would be approximately $1,000,000,000 in gold and $400,000,000 in silver. This would be a real help, but yet it would not have nearly met the indicated requirements.

Some others may agree that a doubled price on gold is reasonable, but that $2.067 per ounce is too much for silver. The only reason that silver is now selling at greatly less than $2 per ounce is because England and the United States have fixed a maximum price on it. Even in the face of this maximum, China offers 20 cents per ounce premium. If the lid were taken off for India and for all other countries under British rule the bids would rise by leaps and bounds. Silver has the disappearing habit to a greater extent than gold. Fully one-half of the silver that is annually coined is retained by India alone. China hoards another big fraction and other Orientals take some more.

No doubt the loudest outcry against standardizing silver would come from those who bow down to the proposition of the inviolability of the gold standard. This is a numerous retinue, but I venture to assert that the personnel of the same consists largely of individuals who have, by force of a habit, contracted some twenty years ago, become addicted to fits at the mere mention of 'bimetalism'. At the time that Bryan advocated the double standard there was no need for it. The only excuse for dragging it in then was that there was an astonishing dearth of real live political issues. The Bryan fiasco was an episode of the last generation, and should not influence this one. Emerson, in his 'Essay on Self-Reliance', says: "A foolish consistency is the hobgoblin of little minds, adored by little statesmen and philosophers and divines. With consistency a great soul has simply nothing to do. He may as well concern himself with his shadow on the wall. Out upon your guarded lips! Sew them up with pack thread, do. 'Else if you would be a man, speak what you think today in words as hard as cannon-balls, and tomorrow speak what tomorrow thinks in hard words again, though it contradict everything you said today." Surely, if ever there was a time when we need a generation of "great souls" it is now. I should hate to be a little statesman leading the hobgoblin bimetallism around always trembling lest it break loose.

What if the United States of America had retained the shibboleths of the past, so that our attitude toward Great Britain as it existed during the first 40 years of our national existence remained unaltered to this day? Would we have allied ourselves with Britain, and would the emancipation of humanity which we now foresee have been possible? I take it that the present generation holds itself unfettered by any of the propaganda of the past, and especially so when that propaganda was conceived without reason. What we are to serve are the needs of today and what, in our best judgment, appear to be the needs of the future. If a man owns a garden-plot he would be foolish to throw away his spade and acquire a gang-plow and a tractor, but if he is to farm a thousand acres he would be equally foolish to retain the spade and curse the tractor as an invention of the devil. With all due respect to some of our hoary statesmen, I think their attitude toward silver places them quite on a par with the supposititions man I have mentioned. The world's need for more standardized metal is so great and so immediate that it is beyond possibility to meet that need in an adequate manner with gold alone. Even now the call of the Orient for coin, not paper, is being answered with silver, and that call is becoming more insistent than ever. The monetary demands of three-quarters of the earth's population can be satisfied with silver.

Many able men have advocated an increase in the monetary value of gold and the standardization of silver. Among all the criticisms of these suggestions I find none that does not admit that such steps would effectually rectify the faults of our monetary system. Mainly the critics state that, first, it would be impossible to make such changes, since to do so would require the consent of all nations, and, second, that it would be undesirable because the result would be to cheapen money by making it more plentiful, and thus would be brought about an unwelcome increase in wages and prices. I assert that both of these claims are unfounded. As to impossibility, the most timorous will admit that the joint power of the United States and Great Britain is unlimited. In view of the remarkable identity of their interests, an agreement between these two should be easily effected. The rest of the world will gladly accept their decision as a boon. As to the undesirability, none exists. That high wages and high prices are not due to a plentiful money supply is proved by the fact that the scale was on the ascendant long before the War began, and it has continued to climb ever since. These conditions have been developed at a time when gold money was never more scarce. It is an immutable law of evolution that as a need becomes existent a power is developed to cope with that need. This law is responsible for the development of the reasoning power in man and for many other things less sublime. In a vague way the demands to be made upon our resources were recognized years before the whys and wherefores were known. Wealth was multiplied manyfold, wages increased, and prices sky rocketed. Once our conception of dollars in money was limited to seven figures. Even before the War our minds could compass ten, and now it takes more than twelve to stagger us.

What has happened is that our scale of living has been magnified. Not only is material wealth increased in acres of productive land, tons of metal, and bushels of wheat, but the value of each unit measures more dollars. Do we not all recall the time when all attempts to diagnose the situation failed? Now we can do it. The law I have spoken of was at work, and values were being created against the time of need. These are conditions which have been thrust upon us without our volition, and we are just about as able to alter them as we are to change the pattern of the firmament. Labor will not submit to material reduction in wages, and a corrolary of high wages is high prices. Furthermore, I say that the man who engages to readjust these conditions by decreasing the scale of living is a fool. He assumes to accomplish the impossible, and even were it possible the accomplishment would be an injury instead of a benefit. Assume that our country has a debt of $30,000,000,000 to pay, and assume that we are now in position to pay it with 15,000,000,000 bushels of wheat at $2 per bushel. Are we rendering any service to ourselves and to posterity by forcing the price of wheat down to $1 per bushel, and thereby making 30,000,000,000 bushels requisite for the payment of our debt? By so doing are we not obliging ourselves to raise double the quantity of wheat, and does that not double our work?

It is a deluded mind that advocates a decrease in the dollar-value of each unit of effort in order to re-establish the former ratio between value as measured in dollars and the dollars on hand with which to measure. To decrease the value of all effort would be unwise if it were not impossible, while to increase the number of dollars with which to measure the value is not difficult and is the wise course to pursue.

Not long ago I had what I now believe to be a mistaken conception of our needs and of the manner in which they were to be met. It seemed to me that a great injustice was being perpetrated upon both gold and silver miners, and I felt that a bonus on gold and the maintenance of a higher price on silver would eliminate the cause for complaint. This view of the situation is from the point of the miner alone, and is altogether too narrow. The need has assumed such proportions and reaches to such limits that the question is one for statesmen. As is set out in the report of our own committee on gold "the principle of the bonus appears to be in general economically unsound." Apparently the governments of other gold-producing countries view it in the same light. Suppose that, by means of a bonus of $10 per ounce, the annual world production were increased from 20,000,000 oz. to

25,000,000 oz. This 25,000,000 oz. would still, for all monetary purposes, be worth but $500,000,000, while it would have cost $750,000,000. Would not the bonus, instead of ministering to our ills, involve us still further in financial decrepitude? But an increase in the monetary value of gold and the standardization of silver is a means which may be adopted without cost to anyone and with great gain to us all. The nation enhances its wealth to the extent of the increased value accorded to gold and silver. The nation benefits, therefore we benefit because we are the nation. Some people cannot see it that way because they look upon the nation as a seperate entity and clothe it with all the base attributes which they themselves possess. The place for the man who chronically looks upon his government as a wicked power, inimical to him, is a blank wall at sunrise.

The situation in which we find ourselves is this: Although it takes no more effort now to elevate one pound one foot, we must pay more dollars to hire that effort; although it now takes no more bread to sustain life, we must pay more dollars to acquire that bread. Thus the total value of all the labor that may be hired, the total value of all commodities that are purchasable, and the total value of all securities that are outstanding is measured by many more dollars than was the case prior to the War. This is as it should be. Taxes alone will pay the world's debts. The greater the dollar-measure of wealth, the greater the dollar-measure of taxes, and, consequently, the more quickly will the debts be paid. It is far more fitting that we devise a means whereby the supply of dollars is increased to meet conditions, than that we attempt to alter conditions so as to correspond with our supply of dollars.

In answer to those who may claim that the increase in existing dollars will decrease the value of the securities they hold, let me say this: The only way in which these securities will be affected will be that, when interest and principal are paid, payment will be made with a coin half the size of the one now used. The buying power of the income from these securities is already fixed at a new level. We have already adjusted ourselves to this condition. A readjustment of our monetary standards merely rectifies a ratio that has become out of proportion. To increase the buying power of the income from securities is highly dangerous. It would mean that the securities would gravitate to those with money to invest. Eventually a few would hold all the evidences of indebtedness, while the many would be sweating to pay them tribute. One can imagine what this would lead to. Are there not Bolshevists enough?

This generation has imposed an enormous burden of debt, not only upon itself, but upon generations to follow. It is the duty of this generation to devise means whereby the burden may be minimized. I claim that the only way in which this can be effectually accomplished is by maintaining a high scale of prices, and I assert that an essential to maintaining this scale is a complete reorganization of our monetary standards.

San Francisco, January 6. EDW. S. VAN DYCK.

The Market Price of Copper

The Editor:

Sir—In order to set forth the recent dilemma of small mine-owners in disposing of copper ores, I would say that on November 15, 1918, Mr. Bernard M. Baruch, chairman of the War Industries Board, conferred with a committee of the copper industry of America, among which were the following:

Daniel Guggenheim, of the American Smelting & Refining Co.,

C. F. Kelley, of the Anaconda Copper Mining Co.,

Daniel C. Jackling, of the Utah Copper Co.,

R. L. Agassiz, of the Calumet & Hecla Mining Co.

This meeting developed the following decisions, which were to remain effective until January 1, and then be subject to renewal or revision, as already agreed upon. Of these the first two only will be quoted as being pertinent to the subject-matter of this letter, namely:

"1. The present rate of production is to be maintained in the mines, smelters, and refineries, continuous employment being thus insured during the first period of the transition from a war to a peace basis.

2. The present level of prices of the metal and the wage-scale of labor are to be preserved."

You may well imagine my surprise therefore when the Garfield smelter people wrote me on December 16 as follows:

"At the present time the 'Engineering and Mining Journal' is not making any quotations for copper and any ore which we might receive from you will have to be settled for on a basis of a provisional price of 11c. for copper, the balance to be determined when the 'Journal' again makes quotations for copper. In any event, some of the balance would have to be paid on quotation 120 days after settlement of assays."

In the face of the fixed price of 26c. for copper until January 1, such action is unaccountable. On the other hand, the Phelps Dodge Corporation, as in other years of crises in the price of copper, issued a circular letter on December 31, notifying their customers of the dissolution of the fixed price on January 1, and stating that during the period of readjustment, in order to keep their customers going, they would pay 16c. per pound for copper upon sampling, the remainder to be paid from their selling-price 90 days thereafter. This method of settlement, as compared with A. S. & R. quotation mentioned, means to many small shippers the difference between continuance and closing-down, but unhappily Nevadan shippers are not all tributary to the Bisbee smelter, in fact, but a small proportion.

Personally, I am not interested pecuniarily in this matter, but I want to see justice be done for those that are struggling in building up the mining industry. I am personally acquainted with the officers of the Garfield Smelting Co., and know that men of more charming personality do not exist, but even they are compelled to obey the edicts that issue from the New York office.

No really large copper organization with whom I have ever dealt has, to my knowledge, attempted the rank deductions that the A. S. & R. people have made in the purchase of copper ores. In recent years, when copper was quoted around 20c., that company paid but ¾c. for each one cent above 14c., and when copper quotations continued to advance to around 30c., there was paid but ¾c. for each one cent above 17c. per pound for copper. Inasmuch as the regular deduction of 3½c. per lb. was also made, and, in addition, on extremely low-grade ores, a deduction of three-quarters of one per cent (later increased to 1%) was made from the assay-value, which latter sometimes meant a deduction of as much as 40 to 50% of the copper content, instead of the customary 10%, it seems to me that the A. S. & R. Co., and all those concerns that have pursued similar methods, should be compelled to reimburse their customers for the above-mentioned extraordinary deduction of ¼c. per pound, which has been simply taken away from them without any apparent reason whatever during the past three years; the only exense given me, at the time of its inception, being that the copper market might drop rapidly at any moment, thus leaving them with an enormous stock of high-priced metal on hand, although they were selling their former stock evidently as rapidly as the market advanced. Upon calling their attention to the fact that they might readjust their enforced quotations and deductions after they had marketed their copper, they refused to discuss it further.

The use of copper quotations furnished by any mining magazine for the purpose of settlements would appear to be erroneous, for, however fair it might desire to be, many sellers would consider it to be more or less controlled by the smelters, and it is hardly within the province of any magazine's staff to obtain the average price, which should be based upon the total sales that are made. The 'Engineering & Mining Journal', published in New York, our central mart, has established a notable record for its endeavor to give fair quotations of copper, based, of course, upon actual sales insofar as its staff was able to obtain. The forming of the Copper Export Association recently is designed to save fifteen to twenty millions of dollars annually to the exporters of that metal. Now the question arises, how many millions annually would the domestic ore-sellers save if a proper commission were established, with Government authority, to ascertain the actual price of the metal sold by the Copper Export Association?

Searchlight, Nevada, January 13. W. W. Wishon.

Injuries in quarries are mostly the result of falling, rolling, or flying objects. It is therefore necessary to pay more than casual attention to proper methods for removing the danger of falls of overburden or of rocks into the quarry pit. Constant watch must be kept and at frequent intervals tests for scale and loose rock should be made. The walls as well as the roofs of quarry tunnels should be inspected and tested, and also the walls in undercut or open workings. One means of preventing such dangers is to make overburden walls less steep and to strip some distance ahead of quarry operations.

Tungsten and Molybdenum in 1918

The total value of the tungsten marketed in this country, coming from domestic sources, during the year 1918, is estimated by F. J. Hess of the U. S. Geological Survey at $2,557,400. This represents an output of 5020 tons of 60% ore and concentrate. The most productive State was Colorado, which delivered 1910 tons of ferberite; California came next with 1781 tons of scheelite, estimated on the standard basis of 60% WO_3. Nevada was third on the list, having marketed 885 tons, this also being scheelite. The production of Arizona amounted to 213 tons, consisting of mixed wolframite and huebnerite. Practically the whole of the remainder, amounting to 231 tons, was derived from South Dakota, with small quantities from Washington and Utah. The largest single producer of ferro-tungsten in the country was the Vanadium Alloy Steel Co., of Latrobe, Pennsylvania, followed closely by the Primos Chemical Co., of Primos (Philadelphia). Other important reducers of tungsten are the York Metal & Alloy Co., of York, Pennsylvania, the Latrobe Electric Steel Co., through its subsidiary the Hudson Reduction Co., the Capitol Chemical Co. and the Chemical Products Co., both of Washington, D. C. The Black Metals Reduction Co., and the Tungsten Products Co. of Boulder, in Colorado, make ferro-tungsten at the works of the Tungsten Products Co., at Baltimore, Maryland. The Electro-Metallurgical Co., a subsidiary of the Union Carbide Co., at its works at Niagara Falls, New York, smelts tungsten exclusively for E. J. Lavino & Co., of Philadalphia. The Lavino firm also owns the Tungsten Metals Corporation at Boulder, Colorado, which is a mining company under the management of George Teal. The largest consumer of tungsten, in the finished product, is the Crucible Steel Co., of Pittsburgh. This concern likewise maintains a large electric smelter for the reduction of tungsten to the ferro-alloy.

Molybdenum was used in considerable quantity for a time, but the end of the War has caused a decrease in the consumption. It was employed in the crank-shafts and in the connecting-rods of the Liberty motors, these requiring about 250 pounds for the two pieces in each machine. The steel used for this purpose consisted of an alloy with 1% of metallic molybdenum. Steel of that composition could be readily forged, and showed superior strength, especially in resistance to torsional strains. This material was made by the United Alloys Steel Co. at Canton, Ohio, a concern owned or controlled by Garford & Timkin, which is closely associated with the Ford Motor Co. The latter company was preparing to produce thin armor plate containing approximately 1% of molybdenum. This steel gave excellent results in test pieces, and would have been produced in large quantities for use in armoring tanks had the War continued. The armor was made one inch thick, and while not directly specified by the Government, it would have been accepted for the reason that the steel conformed to the tests required by the regulations of the War Department.

The Economic Limits to Domestic Independence of Minerals

By GEORGE OTIS SMITH

The war demands placed upon the United States created many new problems in connection with the supply of raw materials. Not only were former sources of supply cut off by the war's interference with commerce, but the large industrial expansion due to the world's larger need of American manufactured products caused in turn increased consumption of raw materials; the net result was an unprecedented and a too largely unexpected call upon the basal industries of the country—agriculture, forestry, and mining.

Already the United States had become more nearly independent than any other industrial nation in the production of minerals; our output in 1913 was 36% of the total for the world and included even larger percentages of the mineral fuels and copper, aluminum, zinc, and sulphur. Yet there were on the other side of the Nation's ledger notable deficiencies in tin, platinum, nickel, manganese, chrome, potash, and nitrates, and the domestic supply of some of these minerals continues to be hopelessly inadequate. To meet the war demand for every mineral raw material was the larger task set before the mineral industry, and the degree of success attained and its cost are the basal facts in any inquiry as to the economic limits that must be recognized in developing the domestic supply.

The conditions presented in the four years of war have been novel and have changed from month to month. Yet in no sense have these changing conditions been outside the realm of economic law. Premises previously unthought of because they involved facts outside former experience, such as destruction of cargo ships or shortage of freight cars, have formed the basis for action incredible in its novelty, yet so necessary that the term 'war times' was used to express the excuse for every act seemingly in violation of both business sense and economic law. In fact, however, both economic law and business sense were being applied to new problems and in new ways in obtaining the raw materials for a nation's expanded industry.

Under these special conditions of supply and demand some minerals have taken on new values indeed, certainty of supply has had larger significance than price. These new values may persist for varying periods, but for some products they must be recognized as only temporary.

It is enlightening, however, to note how large a family of inventions and improvisations can be credited to necessity, and how these substitutes born in time of need develop into lively competitors with the older commodities. Thus, certain potassium salts may never recover the industrial fields that were temporarily (it was thought) given over to the equivalent salts of sodium, and sintered dolomite already competes with magnesite, even though a domestic supply of magnesite is now assured and the imported magnesite may be again available as shipping conditions become normal.

The peace readjustment of the mineral industry requires immediate consideration, involving as it does the future of war-born infant industries but first of all the recalculation of the country's needs. It may be only suggested here that the real issue is to what extent it is of national benefit that this or that new industry should be continued, and that national benefit is to be measured in terms of the premise that industry is the basis of social welfare, not an end unto itself or an opportunity for profit to the few. So it becomes a debatable economic question how much influence can be properly exercised on the natural course of commercial evolution. American experience has shown that some industries soon outgrow the need of governmental fostering but that others never grow up. An all-important element in the problem is whether the product meets an essential need of the country.

In speaking of the expected war demands for raw materials the present writer earlier made the statement that "the mineralogic curiosity of one decade may become the valuable ore of the next." As the years of war have passed many illustrations of this truth have come to the notice of the Survey's investigators. Perhaps no better example can be cited than that of the Leucite Hills, in Wyoming. The Government geologist who was classifying the public coal-lands in that vicinity desired to add to our knowledge of this unique occurrence of interesting rock-types, and before the Survey could publish his scientific contribution the world potash situation gave potential economic value to his field-study. His quantitative estimates of possibly available potash-content are now the incentive to large expenditures in working out extraction processes on a commercial scale, and quarry-sites have been selected where he mapped this peculiar rock. The latest example of an unforeseen use of scientific data is the connection that has recently been developed between the shipping program and the Survey's investigations of the quality of water. These studies of the surface-waters of the United States were begun years ago, and their basis has been geologic as well as chemical. The practical usefulness of the results has, of course, been realized from the start, in connection with steam-making and other industrial uses of river-water, but recently it was found that with a supply of brass tubes sufficient only for the condensers of the naval and merchant vessels under construction, steel tubes must be substituted wherever possible in other condenser installations, and the extent of this substitution, as ordered by the War Industries Board, was conditioned by the quality-of-water data furnished by the Survey.

The war program, with its reaction upon industry, has opened the eyes of many to old facts. Mineral raw materials have won a recognition based upon the new realization of their value. De Launay's recent and apt characterization of coal and iron as the two "grand seigneurs" of the mineral world is in strong contrast with the ancient idea of nobility among metals. The new measure of value is usefulness.

Economic geology is useful geology—the theoretical science applied to meet the material needs of man. These human needs as presented in the last four years have demanded a specialized type of geology—the application of geology in terms of commerce. Geology to be most useful in these days of world problems must take the world view of values, and we find ourselves working in commercial geology—that is, geology applied in terms of commerce. The world is the field of commerce, and the requirements of commercial geology are simply that the geologic relations of a Nevadan ore deposit, for example, must be observed with an eye trained to see far beyond the Basin range; the geologist needs to compare the quality and quantity of the unmined ore here with similar facts of nature that give value to the ores in other districts, as in Peru or Burma. Whether the investigator is called a geologist, mining engineer, or economist, his vision must take in not simply the ore minerals as they have been deposited, segregated, or enriched by the processes of nature, but also the smelted ore and the refined metal on their way to the markets of the world, where they can serve mankind. Thus to broaden and extend the investigator's view is not to commercialize his science; it is rather to make geology more useful, and in that way to give the science a higher rank.

Geology must needs continue to furnish the basal facts, but the geologist has a call to go further than he has gone heretofore in the interpretation of his facts—not simply by translating his technical words into the language of the market-place, but, more than that, by showing the relation of geology to national life.

In terms of commercial geology, therefore, ore deposits take on competitive relationships, and in terms of national interest there must be a determination of relative worth. The practical question concerns not simply the quantity of metal present in the ore but the quantity that can be won to the profit of mankind. First of all, then, in fixing the economic limits to the utilization of domestic mineral deposits, comes the balancing of cost of production with the value of the product. This requirement, which holds good in any business undertaking, however small, is none the less operative in an industry viewed in its national aspect. Economic profit is attained only by reducing cost or increasing value until the margin appears on the right side of the account.

Into the cost of production enter the items of transportation, investment, and labor. An industrial leader like Mr. Schwab appreciates the "handicap of distance," although with a sportsmanlike spirit he and other industrial leaders regard this handicap as simply another incentive to American ingenuity, not as a plea for preferential freight-rates. The transportation factor has played a noteworthy part in every large production enterprise in the United States, where commonly mine and market are separated by hundreds if not thousands of miles.

Improvement in transportation, whether interstate or international, tends to the equalization of opportunity; the peoples of the world are brought closer together. Artificial rates, however, in either interstate or international commerce will impose burdens rather than confer benefits, and we cannot afford to throw back to the era of rebates. Therefore the facts of transportation must be written into the statement of production costs; the geologist and the engineer must from the start be geographers, for distance cannot be eliminated from any commercial problem. The place-factor enters so largely into the determination of value of mineral raw materials that many a promoter would gladly have the scientific investigator close his eyes to the facts regarding the accessibility of the deposit under examination. Yet the transportation cost is too often the cause of financial disaster, even when the geologic and other engineering facts have been correctly determined and are favorable to success.

Investment and labor costs come less under the purview of the geologic engineer in his study of mineral resources, yet the power element is one that touches both of these items and is not to be overlooked by any student of industrial problems. It becomes more and more evident that the use of power, either steam or water, will become the deciding factor in American industry. The statistics of man power cited by Butler* furnish the most convincing arguments as to the stability of our copper industry and its ability to dominate the world markets. The community of interest between some of the largest mining and power corporations is therefore to be regarded as a natural development along economic lines—not as an artifice in restraint of trade. Whether cheap power is made available for mine use by private initiative or by public control, the result is the same—cheap raw materials for other industries.

During the war period the value of raw materials was in large part due to the emergency demand, and the experience should leave its realization of the exigency element in the determination of value. Under war conditions no one questions the great advantage of domestic independence in raw materials, and then adequate supply rather than low price is all-desirable. Nearness of source of raw materials is advantageous at other times, but the amount that can then be added to the value on that account is less easily determined. The purchasing agent of a large manufacturing plant may favor the near-by to the distant source of raw material and the domestic to the foreign producer as a matter of assurance that there will be no interruption to 'keeping the works running'. Yet the spirit of cost accounting leads usually to the cheapest market. Again it happens that when a productive industry so contributes to some larger business or group of industries as to be absolutely essential to their continuance this key industry takes on a larger significance than its size suggests.

---

*Butler, B. S. Copper: U. S. Geol. Survey Mineral Resources, 1917, pt. I (in preparation).

In the consideration of any domestic industry the factor of home consumption must not be overlooked; indeed, home consumption is more directly connected with national welfare than exports. Our high per capita consumption of copper, for instance, means more to the Nation than our exportable surplus of the same metal, the true value of which is indirect through the means it furnishes for trade or exchange for imports of other commodities for our own consumption. A nation that robs its domestic consumers so as to have an exportable surplus or to sell that surplus at a price below cost will be copying a German blunder in economics. Increased consumption of metals and mineral fuels means expansion of all industries, which in turn should mean a larger home market for all the things that go with a higher standard of living.

The Mineral Control Act of 1918 furnishes a too long delayed expression of the emergency value of mineral independence. The exigencies of war revealed many deficiencies in industrial preparedness, and although over one-third of the world output in essential minerals was credited to the United States at the beginning of the war period, the largest part of the raw materials found to be inadequately supplied included minerals and their derivatives. Interruption to the importation of a relatively few ores brought immediate realization of the industrial advantages of a domestic supply, and the coincident shortage in rail transportation showed that the disadvantage of an international long haul differs only in degree from that of too long an interstate haul. The premium that industry can afford to pay for the assurance of an uninterrupted supply of raw material provides the answer to this question of the emergency value of either national or local independence.

The proper valuation of national independence in raw materials therefore requires a careful weighing of the emergency factor, which introduces the insurance idea, as well as an estimating of future possibilities of lower costs as the industry develops.

In every business there are elements of value that do not appear on the cost-sheets. The war record of American business will not be complete except as it includes the story of those producers who kept up their output regardless of the losses involved—a type of patriotism not spectacular, but exceedingly helpful. So, too, in time of peace there may be conditions under which, viewed in the larger way, it pays to do business at a loss.

A composite diagram of either current output or future reserves of the essential minerals for the countries of the world would show so large a centralization in North America as to suggest that here is a group of nature-favored nations. This strategic advantage expresses itself in the well-recognized large degree of self-sufficiency of the United States, so that the question of economic limits to domestic independence concerns a relatively small number of minerals and makes our problem quite different from that in other and less favored nations. However, whether the debatable list includes only chromite, manganese, pyrite, and potash or is much longer, clear analysis of the economic problem is needed, for cost keeping on a national scale is the only safeguard against a loss which is real though not at once apparent.

Whether wisest utilization of mineral resources means full utilization is debatable, and every student of natural resources realizes that the time of utilization is often an element in the degree of wisdom shown. It is not necessarily prodigal wastefulness that only the richest ore is mined when a new district is discovered; creation of transportation facilities, construction of smelters and mills, and general advance in technology are the intermediate steps between bonanza exploitation and the highly organized operation of low-grade deposits. Utah had a long history as a mining State and its contributions to the world's wealth were large before Bingham started a new epoch in copper mining. So, too, the re-working of dumps and of tailing-ponds furnishes illustrations of the complete utilization that is evolved in these changing conditions.

The largest degree of national usefulness will be won from our mineral resources only through the highest industrial efficiency, which is in turn secured by engineering advance and the linking up of mechanical power and man power. This means to the end is typically American, but too much emphasis cannot be put upon the importance of governmental action that is constructive in its co-operation with industry. While, unfortunately, public regulation seems to start usually with measures that are wholly restrictive in effect, because too often abuse of privilege has led to the legislative action, yet regulatory measures can be truly promotive, as has been shown in the recent co-operation of business and the Government. Public interest and private interest in the long run are less antagonistic than either the captain of industry or the public servant has suspected. It is true that the measure of economic worth must be the welfare of the individual, the community, and the people of the Nation, and not the dollar of profit to the corporation or the State, yet only a successful industry can be made to serve both owner and workman and the public as well. If the product is not actually worth its whole cost, no camouflage of bounty or tax exemption or import duty will long conceal the inherent weakness of the industry. The basic importance of the raw material resources to the country makes it a prime public duty of citizens generally to know the facts regarding the mineral industry, and to ascertain these facts the intensive study of our own resources is not enough; we must also acquire a comprehension of what minerals other countries contain to supplement what we have at home.

The Flotation of Galena at the Central Mine, Broken Hill

By R. J. HARVEY

*INTRODUCTION. The ore is a complex silver-lead-zinc sulphide associated in the main with quartz, rhodonite, rhodochrosite, and some garnet-sandstone. The assay-value is now approximately 11 oz. silver, 14% lead, 15% zinc. The silver accompanies the galena. The lead is present as a good-grade galena and the zinc as a somewhat low-grade blende not assaying much better than 50% zinc. Crushing to 40-mesh has been found necessary to obtain complete freeing of the mineral particles from the matrix and from each other.

In brief, the milling operations prior to the introduction of selective flotation were:

Crushing to ¼ inch and jigging.

Re-grinding the jig-tailing to 40-mesh.

Concentration on Card and Wilfley tables, and Weir-Meredith vanners, the former for the grainy material and the latter for the slime.

Flotation for a leady-zinc concentrate that was re-tabled on Wilfley tables and Weir-Meredith vanners produced an improved grade of zinc-concentrate and gave a little more lead-concentrate. See Fig. 1.

The milling results of the above operations were:

	Proportion	Silver	Lead	Zinc	Recovery		
					Silver	Lead	Zinc
	%	Oz.	%	%	%	%	%
Crude ore	100.0	11.6	14.5	16.4	...	...	...
Lead-mill lead concentrate..	15.5	32.9	67.6	6.2	43.9	72.1	5.8
De-leading lead concentrate.	1.3	46.3	60.6	13.8	5.3	5.5	1.1
					49.2	77.6	...
Zinc concentrate	30.8	16.1	8.3	45.8	42.6	17.7	85.8
Residue	...	2.3	1.8	2.9	...	...	...

Effective lead recovery 77.6%
" zinc " 85.8%
" silver " 49.2%

Tonnage treated: 1000 long tons per week.

In 1902 or 1903 it was a matter of common observation that, wherever there was a splash of pulp with the consequent aeration, bubbles of air were formed carrying galena, and at one period boys were employed to skim off this froth, which was added to the concentrate before shipment.

The introduction of flotation as a commercial process for the recovery of blende caused the matter, however, to be dropped for the time and no more was done in the direction of galena flotation until the middle of 1913, when the first serious attempt to do so was made. This comprised the erection of a plant on the systems devised by F. J. Lyster and T. M. Owen, and involved aeration aided by the use of an essential oil, namely, eucalyptus. This operated on slimes and demonstrated the possibilities of the selective flotation of galena.

About the same time the then mill-superintendent, A. W. Wineey, designed a crowding-hood on a distributing-box that received the discharge of an elevator carrying pulp, and by this means was able to obtain without cost about 15 tons weekly of a float-lead concentrate rich in silver. This further confirmed the feasibility of selective flotation.

EXPERIMENTAL WORK. The use of selective flotation and its evident great bearing on the possible profits from the company's operations determined the management to erect an experimental laboratory where flotation methods suitable to the ore could be evolved. I was appointed experimentalist in this laboratory. The first important investigation carried out was to determine the possibility of recovering the valuable metals from a large dump of slime, all of which was ten years old. This dump represented the slime accumulated during several years before the flotation process was in use on the mine.

After some experiments, I found it possible to obtain

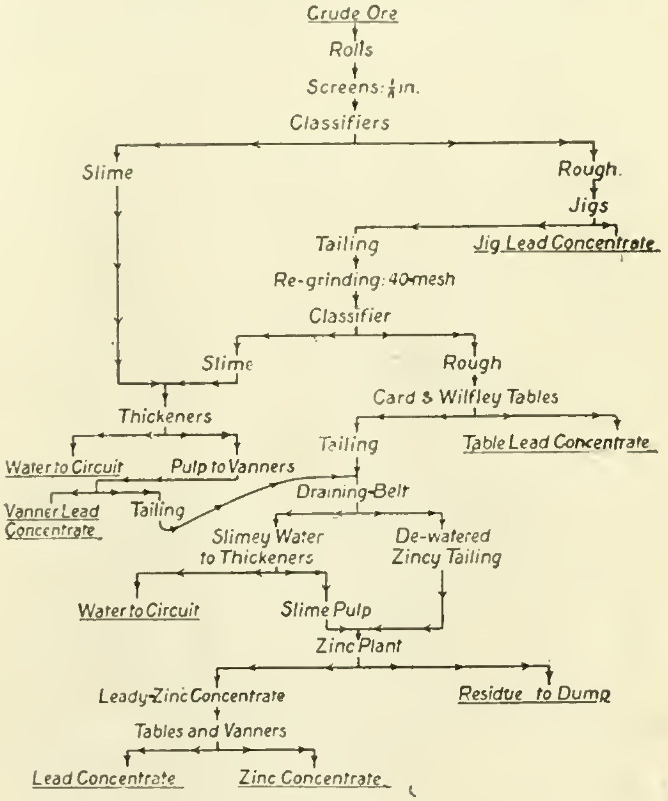


FIG. 1

---

*A paper read before the Institution of Mining and Metallurgy, London, on November 21, 1918.

a fair recovery of fine argentiferous galena by flotation, using only sulphuric acid as a medium, the results, however, being improved by performing the operation in a flotation circuit (water already used for flotation purposes). This, with the apparatus, was patented in the names of James Hebbard (the manager of the mine) and myself, and assigned to Minerals Separation, Ltd. Following these results an already existing plant was altered to suit the new conditions and commenced operations early in 1914. A description of this plant, the flotation machine of which was the outcome of experiments conjointly carried out by the Broken Hill South Silver Mining Co., Amalgamated Zinc (DeBavay's), Ltd., and the Sulphide Corporation, follows later.

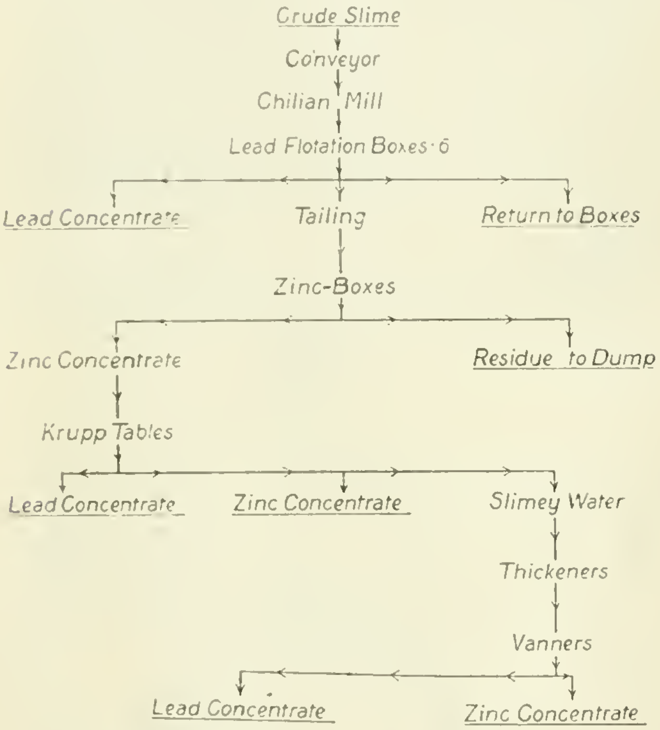

FIG. 2

While this dump-slime investigation was proceeding, tests were made upon current slime production in the same apparatus, using eucalyptus in place of acid, and indications were obtained of the possibility of future success.

DUMP-SLIME PLANT. It has already been stated that this plant started operations after re-modeling early in 1914. Previously it had been used quite successfully to treat the dump-slime making a leady-zinc concentrate, which, however, was not readily marketed, and in consequence in 1909 the plant was stopped and has not since been in operation. The plant lay some distance from the slime-dump, and this involved haulage by rail. Hopper-wagons with bottom-discharge were used. The material was shoveled, after discharge from the wagons, onto a belt-conveyor and fed to a pair of grinding-pans adapted as Chilean mills. After thorough pulping, it was elevated to a set of six mixer-boxes. These boxes, of cast-iron, 3 ft. 6 in. square and 5 ft. deep, were of the under-driven sub-aeration type. The stirrer, which was 18 in. diam. and 3½ in. deep, acted both as agitator and air-pump and ran at a peripheral speed of 2300 ft. per minute.

Immediately before the pulp reached the first box, sulphuric acid was added. Lead-concentrate was removed from the first four boxes, the float from the last two being returned to the feed. Flotation for the remaining valuable metals followed, using acid, eucalyptus, and steam sufficient to raise the pulp to 130° F. The leady-zinc concentrate obtained by this second flotation operation was passed over Krupp tables and Weir-Meredith vanners to induce a further separation of the galena from the blende. It was not expected that the selective flotation would recover all the galena, but that it would catch the finest of the lead unobtainable by ordinary gravity concentration.

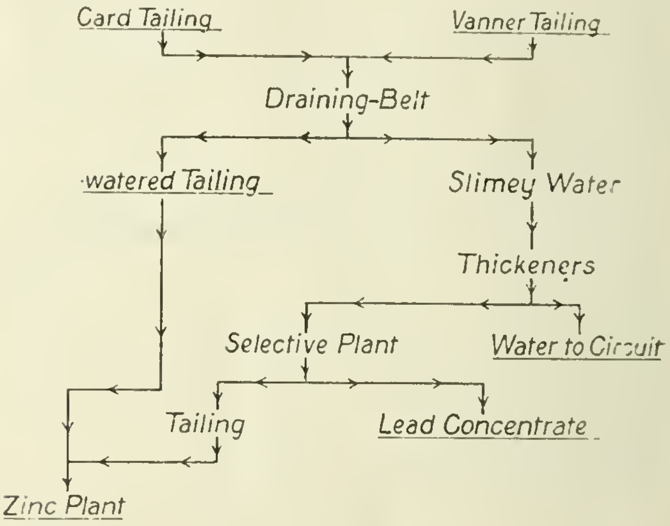

FIG. 3

It must be remembered that the slime being treated was accumulated in days when classification apparatus was not so effective as it is today, and, consequently, quite coarse galena existed in the dump. The pulp would practically all pass 200-mesh, but galena of this size is obtained associated with larger sizes both on a jig and on a table.

This plant (Fig. 2) was in operation with improving results until war broke out in August 1914, when it was once more stopped and has since remained so. The following table shows the work being done immediately prior to closing-down:

	Proportion %	Silver Oz.	Lead %	Zinc %	Recovery Silver %	Recovery Lead	Recovery Zinc %
Feed	100.0	15.6	17.0	19.1	...		..
Lead concentrate by flotation	10.3	53.8	49.9	21.4	35.5	30.1	11.6
Lead concentrate on tables	4.2	35.2	60.4	14.5	9.6	15.0	3.2
Zinc concentrate	30.2	17.5	15.2	41.7	33.9	26.9	65.9
Residue	..	5.9	8.6	6.7	...		...

LEAD MILL. It has already been remarked that experiments demonstrated the possibility of recovering galena from the slime produced in the lead-concentrating mill. Early in 1915 it was decided to apply sub-aeration methods to this slime in preference to the Lyster system. For

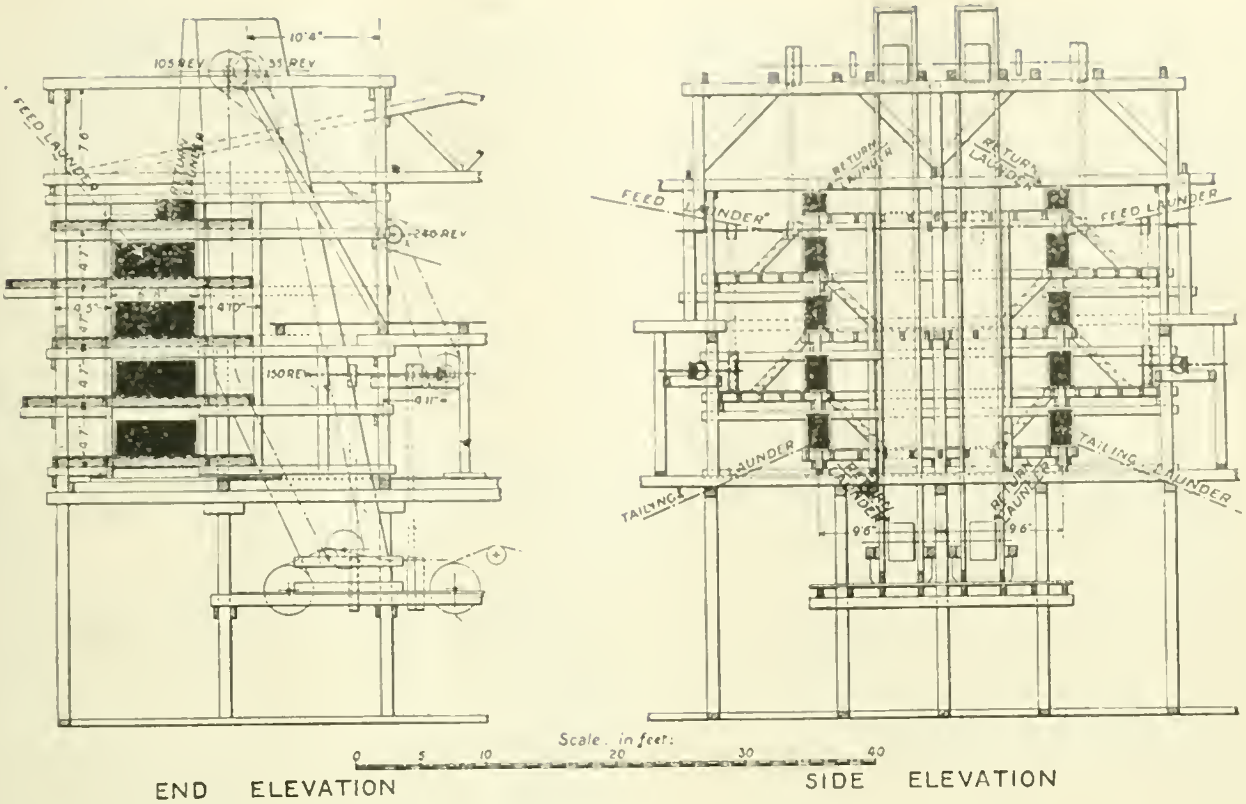

FIG. 4

a start, an 8-box machine was erected. This was similar in design to that used at the dump-slime plant, but smaller. Wooden boxes 24 by 24 in. by 36 in. high were supplied with 10-in. stirrers driven from below at a speed of 1000 r.p.m. The air was drawn by the stirrers through ½-in. pipes supplied with regulating valves. Two horse-power was required per stirrer. To control the rate of feed to the boxes a feed-tank was installed. As this 8-box unit gave satisfactory results, two more similar units were erected, and the 24 boxes were then capable of handling the full output of slime, some 800 tons weekly. This plant used the ordinary mill-circuit, a mixture of mine-water and excess water from the existing zinc-flotation plant, with addition of Broken Hill Water Supply Co.'s water when required.

As flotation media, eucalyptus oil, wood-tar oil, and pine-oil were used, being added to the feed-tank elevator. No definite mixture of these was supplied, the quantity of each being regulated by requirements for the time being. The amount used per ton of slime averaged 0.25 lb., and wood-tar oil predominated.

The following table gives the results obtained by this plant:

	Proportion %	Lead %	Recovery of lead %
Slime feed	100.0	13.3	...
Lead concentrate	13.3	67.1	67.1
Tailing	86.7	5.0	...

So much less fine galena was now going to the zinc-flotation plant and thence to the zinc-concentrate de-leading section that it was possible to put the Weir-Meredith vanners in the latter section out of commission, still, however, retaining the Wilfley tables.

For some time prior to 1915 it was evident that a saving in cost and an enhanced recovery could be obtained by the erection of a new zinc-flotation plant. Work in the experimental plant had demonstrated that sub-aeration methods would be satisfactory, and a plant for this purpose was designed, erected, and in October, 1915, was put into operation. While experimenting, it was found that fine galena could be recovered by flotation from the by-products of the lead-mill. Here it should be mentioned that the flow-sheet then in use did not provide for quite all the slime to go to the selective plant (24 by 24 in. boxes). The Card and vanner tailings were de-watered by means of a draining-belt, the de-watered material containing some settled fine going to the zinc-plant, and the slimy water to thickeners. The settled slime from the latter provided the feed for the selective plant, the tailing from which went to the zinc-plant, which in one section handled the whole of the zincy tailings (coarse and slimes) of the lead-mill, which handled 4000 tons per week of 136 hours. The flow-sheet (Fig. 3) will help to make matters clear. In view of the presence of this recoverable galena in the feed to the zinc-plant it was decided to make the new plant a combined lead and zinc flotation plant, that is, capable of first floating off the galena and subsequently the blende. This dual machine was of the same design as that at the dump-slime plant, with boxes 42 by 42 by 60 in. high. Five boxes were set apart for galena flotation and nine for zinc—14 boxes in all.

The tailing from No. 5 box was re-elevated to No. 6 box, no direct connection existing between No. 5 and 6.

In realty the five lead-boxes formed a trough with five stirrers in it, the divisions between the boxes only existing for 18 in. from the bottom. Stirrers 18 in. long, 3½ in. deep, making 530 r.p.m., were used, taking an average of 12 hp. each. By degrees it was found possible first to discard the vanners in the lead-mill, relying on the selective plant and the five boxes in the new zinc-plant to recover the galena. This was found quite satisfactory and the next step was to drop out the Wilfley tables that were handling the middlings from the Card tables in the lead-mill. This also proved satisfactory. Finally, the selective plant was closed-down and the whole of the galena flotation was done by the five boxes in the zinc-plant. This was the result hoped for by the management, but it was deemed advisable to perform the discarding of plant in stages so that no increased loss of lead in the zinc concentrate should take place unnoticed.

So far, then, it was found that by the use of flotation for galena:

1. An enhanced recovery of lead and silver was obtained.

2. Vanners were unnecessary first in the de-leading plant and subsequently in the lead-mill.

3. Re-treatment of middlings from Card tables was not required.

4. As a result of No. 1 point, less lead was in the zinc-concentrate.

More than this, it was demonstrated that fine galena could be floated out of ordinary mill-pulp without previous classification of the pulp.

The introduction of the above methods increased the recovery of lead from the crude ore by 7% and of silver by 15%.

The fineness of the galena concentrate won by flotation is shown by the following analysis:

Selective Lead Concentrates

I M M screens	Proportion %	Silver Oz.	Lead %	Zinc %
Bulk	...	59.1	60.0	13.3
+ 120	1.2	...	48.8	16.6
− 120 + 150	1.2	...	61.4	12.4
− 150 + 200	3.6	63.4	61.0	12.2
− 200	94.0	56.6	60.4	13.6

The improvement in the grade of the zinc concentrate as a result of the installation of galena flotation is shown by a comparison of the following sizing analyses, the lower assay of lead in the finer sizes being marked.

Sizing Analysis, Zinc Concentrate Before the Installation of Galena Flotation

− 200	24.2	14.2	6.0	45.4

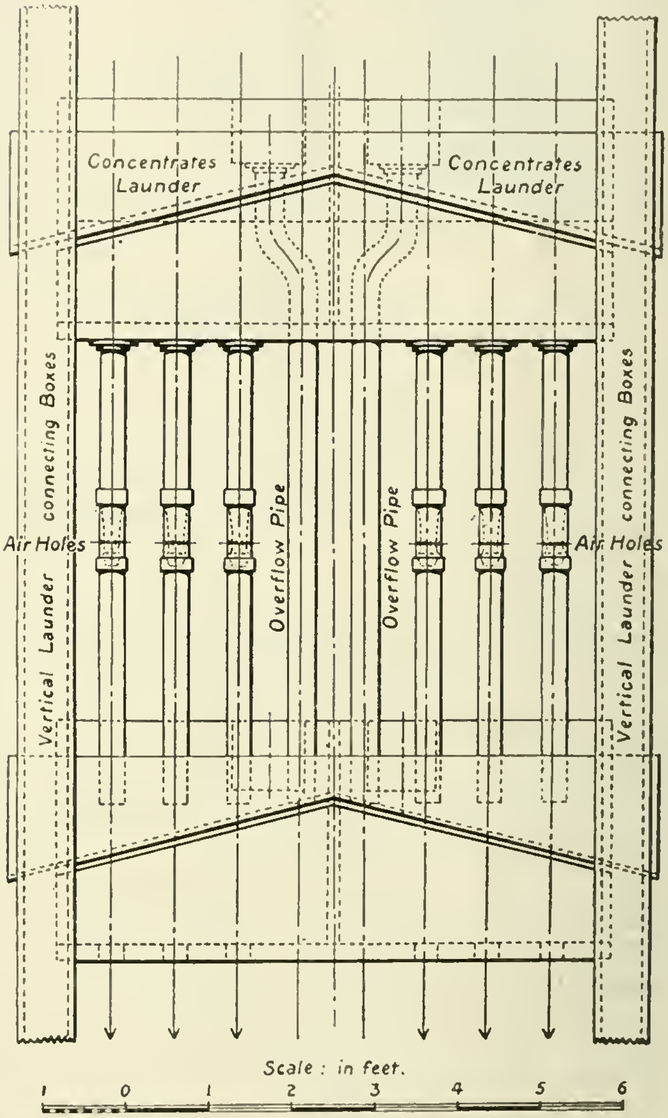

Fig. 5

The marked success of the above changes in the milling operations and the evident possibilty of floating the slimed galena naturally led to seeking means of concentration of coarser particles of galena by flotation. Two metallurgists on an adjacent mine, H. V. Seale and W. Shellshear, had utilized the principle of the nozzle for aeration of a flotation pulp, and had designed an apparatus that was capable of floating coarse galena. Their idea was modified by others on the staff of the Zinc Corporation and was then tried by the management of the Central mine. A plant to treat 2000 tons per week was erected and after experiments a successful design was evolved by the metallurgical staff of the Central mine. So satisfactory was the design and so encouraging were the results obtained that it was decided to erect a plant large enough to handle the whole output of re-ground jig-tailing previously treated on Card tables. This new plant has recently been completed and is now in operation with good results; in fact, it is hoped that in the end it will be possible to discard the five boxes in the zinc-plant that are now used for floating galena. A

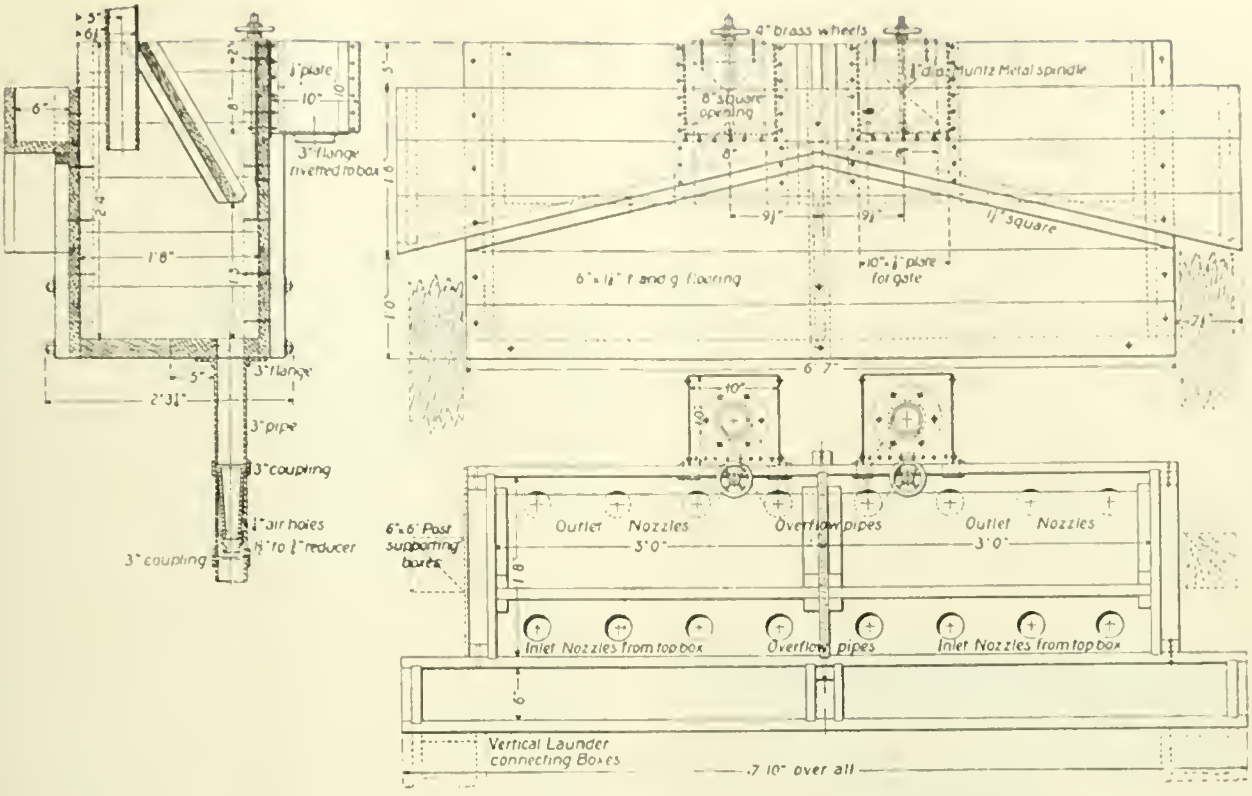

FIG. 6

small quantity, about 2 oz. per ton, of a mixture of coal-tar and eucalyptus is added to the pulp as flotation media.

The following comparative tables show the recovery made by the Card tables and that obtained with the Cascade machines:

	Proportion	Silver	Lead	Zinc	Recovery		
					Silver	Lead	Zinc
	%	Oz	%	%	%	%	%
By-products from jigs.....	...	10.6	10.0	16.1	...	...	...

By-products from Cascades..	...	7.1	5.0	17.0	...	...	...

LEAD-CASCADES. This is the name given to the latest galena-flotation plant of the Central mine, which has ousted the Card tables previously in use. The plant is simplicity itself (Fig. 4, 5, and 6). There are no moving parts, no use of compressed air. All that is required is the necessary elevating of prepared pulp. On a suitable site this elevating would not be required. The plant consists of a series of boxes set one above the other, the pulp in descending from box to box passing through nozzles, thereby drawing into itself the air necessary for flotation. The concentrate flows over the lip of each box and the tailing passes to the next in series. The boxes are 36 in. long, 18 in. wide, and 28 in. high. Three nozzles are supplied to each box. The distance between the bottoms of any two boxes is 4 ft. 9 in., and nine boxes of the above size in series form one unit. In order to reduce the height of the plant and bring it on to as few floors as possible, there is an elevator between No. 4 and 5. Two units are in use, the intermediate elevator being common to both. By means of a system of overflows, irregularities in the volume of pulp are checked. This plant has been a complete success, the recovery of the lead and silver being greater than with Card tables, and no Card tables are now in use for concentrating crushed ore. The

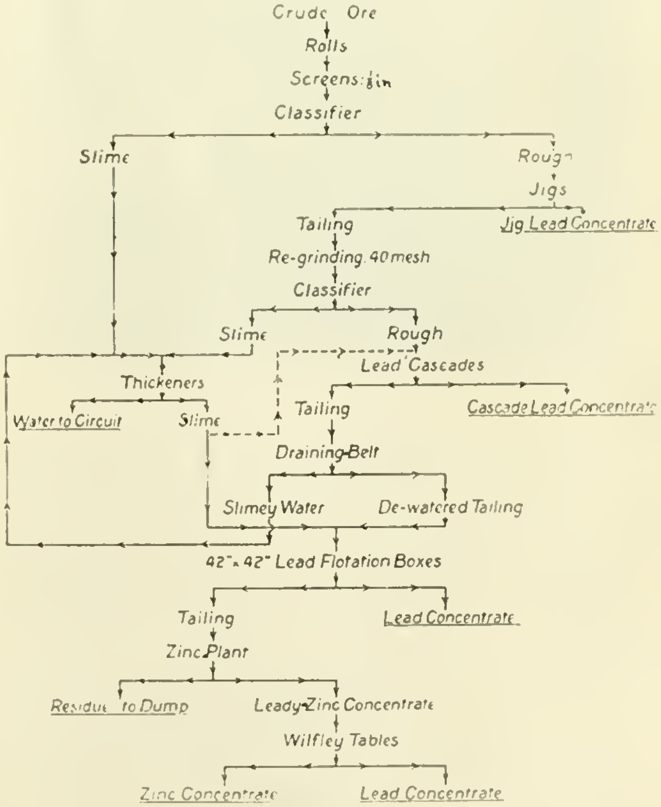

FIG. 7

galena that escapes the Cascades is, if fine, caught by the galena flotation boxes in the zinc-plant and, if coarse, is removed from the zinc-concentrate by the Wilfley tables in the de-leading plant.

The following shows the milling results for a recent period:

	Proportion %	Silver Oz	Lead %	Zinc %	Recovery Silver %	Recovery Lead %	Recovery Zinc %
Crude ore	100.0	11.8	14.0	15.6	...	...	...
Lead mill lead	17.1	40.8	64.6	9.0	60.1	80.2	10.0
De-leading lead	1.3	39.3	58.1	13.8	4.3	5.4	1.1
					64.4	85.6	
Zinc concentrate	27.2	12.8	5.1	47.9	29.4	9.9	83.3
Residue	...	1.3	1.1	1.5	...	...	...

Effective recovery, lead 85.6%, silver 64.4%, and zinc 83.3%.

In conclusion, I may say that the problem is not completely solved, perhaps it never will be, but scientific investigation is proceeding all the time. The substitution of flotation for gravity concentration has meant the discarding of 20 Card tables, 4 Wilfley tables, and 16 Weir-Meredith vanners in the lead mill, and of 14 Weir-Meredith vanners in the de-leading plant, with the necessary attendants and maintenance, and it has simplified the flow-sheet of the Central mill. (Fig. 7).

Screen-analysis of jig-lead concentrate, Card-table lead-concentrate, and Cascade lead-concentrate are appended, as they are instructive and of some interest in conjunction with the foregoing history.

The object of this paper being almost entirely to trace the steps by which flotation has superseded gravity concentration at the Central mine, the various mechanical contrivances tried or adopted have not been elaborated, hence no machine-drawings are appended.

The Sulphide Corporation, owning the Central mine mentioned above, has paid large dividends since 1898, 25% in 1917. The output last year was 41,426 tons of concentrate assaying 40.9 oz. silver, 63.1% lead, and 8.9% zinc, and 55,990 tons containing 12.6 oz., 5.7%, and 47.3%, respectively.

Anaconda and Chile

Copper and financial circles were distinctly surprised at the public offering of $25,000,000 6% 10-year bonds by the Anaconda Copper Mining Co. The bonds are to be a direct obligation of the company and will be additionally secured by specific pledge of stocks of constituent companies valued in excess of $100,000,000. Proceeds of these bonds are to be used toward the equipment of the properties of its two South American subsidiaries, Andes Copper Mining Co. and the Santiago Mining Co. and to replace in current account earnings already invested. Anaconda's Andes project in South America is by far the biggest piece of copper mining development in progress today. Churn-drills have determined an orebody 1800 ft. long, 900 ft. wide, and 850 ft. deep containing over 32,000,000 tons of ore averaging 1½% copper. In addition to this known body of ore, other ore in the vicinity has been proved up to the extent that the total now exceeds over 100,000,000 tons averaging 1.4% copper. The property is situated at a height of 10,500 ft. in the mountains. Construction of a '70-pound' railroad is in process from Port Charnaral to the mine, the last five miles of which will be through a 75% hard rock tunnel. In addition to building a railroad and steamship terminus at Port Charnaral, a 22,000-kw. steam-turbine electric plant is being installed which will provide power for the mine and mill at 100,000 volts. At the mine a 15,000-ton concentrator is to be erected and plans are being made for a model town of about 5000 inhabitants. Much of this construction has been held up by war conditions and inability to get either raw material or shipping. With the way clear ahead it is the intention to prosecute development work to make Andes Copper Co. a backlog against any possible diminution in output from the Butte mines. The company states that during the period from January 1, 1913, to September 30, 1918, net earnings after interest and all taxes but before depreciation "averaged $28,700,000 per annum, or over the face value of the bonds." In the five years to the first of January, 1918, Anaconda's net after interest but before taxes and depreciation totaled $134,471,916. Estimating the company's 1917 tax bill at $2,000,000, the net total was $132,471,916. On the basis of the company's statement that net averaged $28,700,000 per year for the last six years or a total of $172,200,000, it would seem that earnings for the nine months to September 30, 1918 were approximately $39,728,084 before taxes and depreciation. Anaconda is the largest producer of copper in the world and its mines are located in one of the greatest mineral districts known. During the past 25 years over 16% of the copper production of the world, and over 25% of that of the United States came from the mines now owned by the company.—'Boston News Bureau'.

A Mine Latrine

By WILLIAM W. CORT

[*]In mines in which the conditions of temperature and humidity underground are suitable for the development of hookworm larvae proper underground latrines are essential for the protection of miners from infection with hookworm disease. This is one of the most difficult problems of sanitation with which the mine operator has to deal. An underground latrine to be successful must be simple, sanitary, of small cost, easy to install, conveniently placed for use, and easy to keep clean. In Special Bulletin No. 28 of the California State Board of Health, 'Sanitation in Mines for the Prevention and Eradication of Hookworm', the general problem of underground sanitation in mines in relation to hookworm is considered and a number of specific suggestions are made in regard to suitable latrines. In that paper a latrine devised by G. F. Williamson and installed in the Belmont Shawmut mine is figured. More recently a number of improvements have been made in this and its utility has been fully demonstrated. A detailed description of this latrine and the sanitary arrangements connected with it may be helpful to mine operators who are considering improvements of this kind. Such a system of underground sanitation as that of the Belmont Shawmut mine, if carefully kept up and backed by definite rules against soil pollution, will prevent hookworm from being introduced into a mine, and will make effective other steps for its eradication in mines already infected.

I wish to thank Mr. Williamson, the superintendent of the Belmont Shawmut mine, for his kindness in permitting me to use the drawings reproduced in this article and for his help in gathering information included.

Drawings of this latrine, including materials and cost of construction, are shown in Fig. 1. Fig. 2 is a photograph of the completed latrine. The low cost, less than ten dollars apiece, is a decided advantage, since it makes possible the use of a large number, which renders them easier to keep clean, since fewer men use each one. It also tends to decrease soil pollution, since the latrines can be placed in places convenient for all. The framework is so light and easily handled that the latrine can be carried down in the skip after being completely constructed above ground; it also can be easily moved from one part of the mine to another when the shifting of the work demands the transfer of the men. The latrines should be placed conveniently in well-lighted well-ventilated places, and a sufficient number placed, so that there will be at least one for every 12 men.

Several features call for mention. Recognizing the importance of keeping the seat clean and the tendency of the miners to stand on the seat, the top of the frame is made so low that it is impossible to stand up. The seat is constructed so that it can be easily removed when badly soiled and a new one substituted. It is suggested that several extra seats be kept constantly on hand. The can is simple in construction with a tight-fitting lid that can be clamped down. For convenience in emptying, a paraffined bag is placed in the can. These bags are water-tight and when the cans are emptied they slip out, leaving the cans entirely clean. The bag must fit closely and should be a little taller than the height of the can so that the free edges can be turned over to hold it in position. Paraffined paper bags for this purpose were obtained for this purpose at about $25 per hundred. The bags must be carefully packed for shipment and carefully unpacked, because even the slightest break spoils them for use in the cans. The paraffined bags will serve their purposes well. In one case the can was not emptied for two weeks; at the end of this time the bag was still water-tight and slid out without difficulty when the can was emptied. The use of these bags does away with most of the disagreeable features incident to the care of latrines. When a latrine is installed ready for use a layer of sawdust about three inches deep is sprinkled in the bottom of the paper sack. Each man is instructed to throw a little sawdust and lime into the can after using. With a maximum number of 12 men using one of these latrines, the can should be emptied once a week.

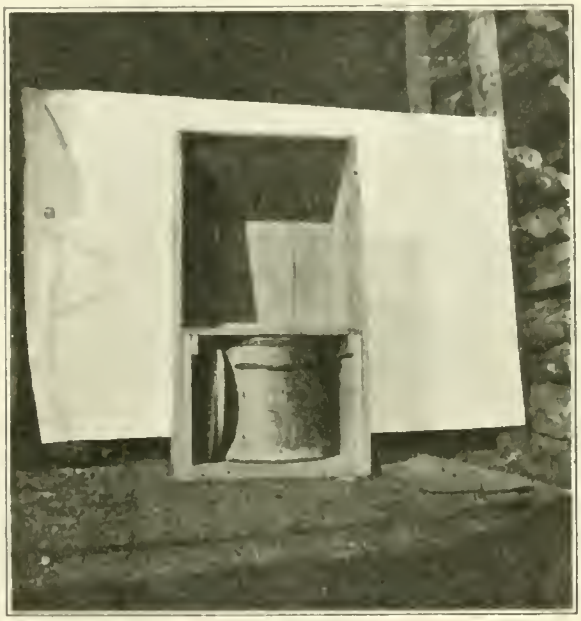

FIG. 2. THE LATRINE

---

[*] The author is Consulting Helminthologist to the California State Board of Health.

The care of these underground latrines is a difficult problem. It is hard to get men who are willing to do this type of work and the time involved is an important item of expense. In the Williamson arrangement the disagreeable features and the time involved in emptying the cans are reduced to a minimum. Before emptying, lime is sprinkled into the cans and they are then filled with sawdust. The clamps on the covers make the cans perfectly tight and easily handled in the skips. The actual time necessary to bring five cans from different levels of the Belmont Shawmut mine to the surface and empty them was four hours for one man. Extra cans should be kept and each can immediately replaced when taken out for emptying. The fact that the incinerator in this mine is about half a mile from the mouth of the adit increased the time necessary for this work.

To dispose of the waste material an incinerator was used, drawings of which are shown in Fig. 3. (See opposite page.) Such an incinerator can be used for a number of other purposes. It is not expensive and will last for a long time. In regard to the cost of the incinerator, I quote from a letter from Mr. Williamson:

"We are unable to furnish a very accurate estimate of the cost of building this incinerator and therefore have made no comments. As you doubtless noticed, the one we have is made up of old boiler equipment and scrap material. A cost estimate is hardly worth while, as it can be made up of either an old boiler or other cast-off material usually found around a mine."

The use of an incinerator, especially in mines where hookworm is prevalent, is by far the safest method for disposing of the waste and is recommended as a sanitary precaution.

Blueprints of the Williamson latrine and incinerator will be furnished on request. Communications should be addressed to the Division of Parasitology, California State Board of Health, East Hall, Berkeley, California.

Output of Petroleum

Domestic petroleum requirements in 1918 were almost 400,000,000 barrels, according to the U. S. Geological Survey. Production in this country was 345,500,000 bbl., and the year's needs had to be met by withdrawals from surplus stocks and imports from Mexico.

Production of 345,000,000 bbl., a new high record, compares with 335,000,000 in 1917, a gain of 3%. Output in leading fields, was as follows:

	1918	1917
Appalachian	25,300,000	24,032,205
Lima-Indiana	3,100,000	3,670,293
Illinois	13,300,000	15,776,800
Oklahoma-Kansas	139,600,000	155,043,500
Central and North Texas	15,600,000	10,000,646
North Louisiana	13,000,000	8,501,963
Gulf Coast	21 700,000	26,087,587
Rocky Mountain	12,000,000	9,199,310
California	101,300,000	93,877,549
Alaska and Michigan		10,300
Total	345,500,000	335,315,601

The output in 1918 includes 6,500,000 bbl. of crude removed from field-storage, but it excludes drafts aggregating 20,500,000 additional barrels from the stocks of pipe-line companies. The surface reserve of crude held by producers and pipe-line companies in the United States at end of 1918 is estimated at 123,000,000 bbl., compared with 150,000,000 at end of 1917. These figures show that the demand for domestic petroleum in 1918 was about 366,000,000 bbl. Exports of crude, most of it to Canada and north-western Mexico, aggregated about 5,500,000 bbl., leaving 360,500,000 available to supply domestic needs. This was insufficient, however, and about 36,500,000 was imported, nearly all from Mexico, to meet domestic requirements, which amounted in all to about 397,000,000 barrels.

The increase in output was made in response to the steadily growing demand for petroleum, expressed in advancing prices for crude oil, which were stabilized, with Government approval, at record levels during the closing months of the year. The most pronounced response to stimulus of war-time demand was made in Central and North Texas, North Louisiana, Rocky Mountain, and California fields, but the gain of the old Appalachian field, though moderate, is significant.

In California the principal source of new production was the Montebello field, discovered in 1917, in Los Angeles county, which, with the Casmalia district, in Santa Barbara county, and older districts in both San Joaquin Valley and Coastal-Southern divisions apparently succeeded in establishing a new record for production in California, exceeding 100,000,000 barrels.

The gain in the Rocky Mountain field is credited to Wyoming and ascribed in part to the Big Muddy field in the western part of Converse county, in part to drilling of a few new wells of large capacity in the heart of the Salt Creek field.

Momentous developments that affect the future supply of high-grade petroleum in the United States took place in 1918 in Central and North Texas field, after petroleum had been discovered in considerable quantities near Ranger, in Eastland county; near Caddo, in Stephens county; near Brownwood, in Brown county; and near Burkett, in Coleman county, in 1917. About 60 wells were completed during 1918, and at the end of that year the new field was credited with a potential capacity of 50,000 bbl. per day, although its actual capacity, limited by pipe-line facilities, was only about 18,000 barrels.

Aluminum dust burns quietly when in a pile, but if this pile be disturbed in such a manner as to raise a cloud of the dust into the air, the burning takes place with explosive violence. If a dust-cloud already formed that has a density within the explosive limits be ignited, a violent explosion results, according to Alan Leighton of the U. S. Bureau of Mines. Water is worse than useless in extinguishing fire in aluminum dust; it is positively dangerous. The fire may be smothered by sand or oil, carbon tetrachloride being used to put out the oil later on.

Copper output of the Chile Copper Co. during 1918 totaled 102,130,000 lb., against 87,450,000 lb. in 1917 and 44,100,000 lb. in 1916.

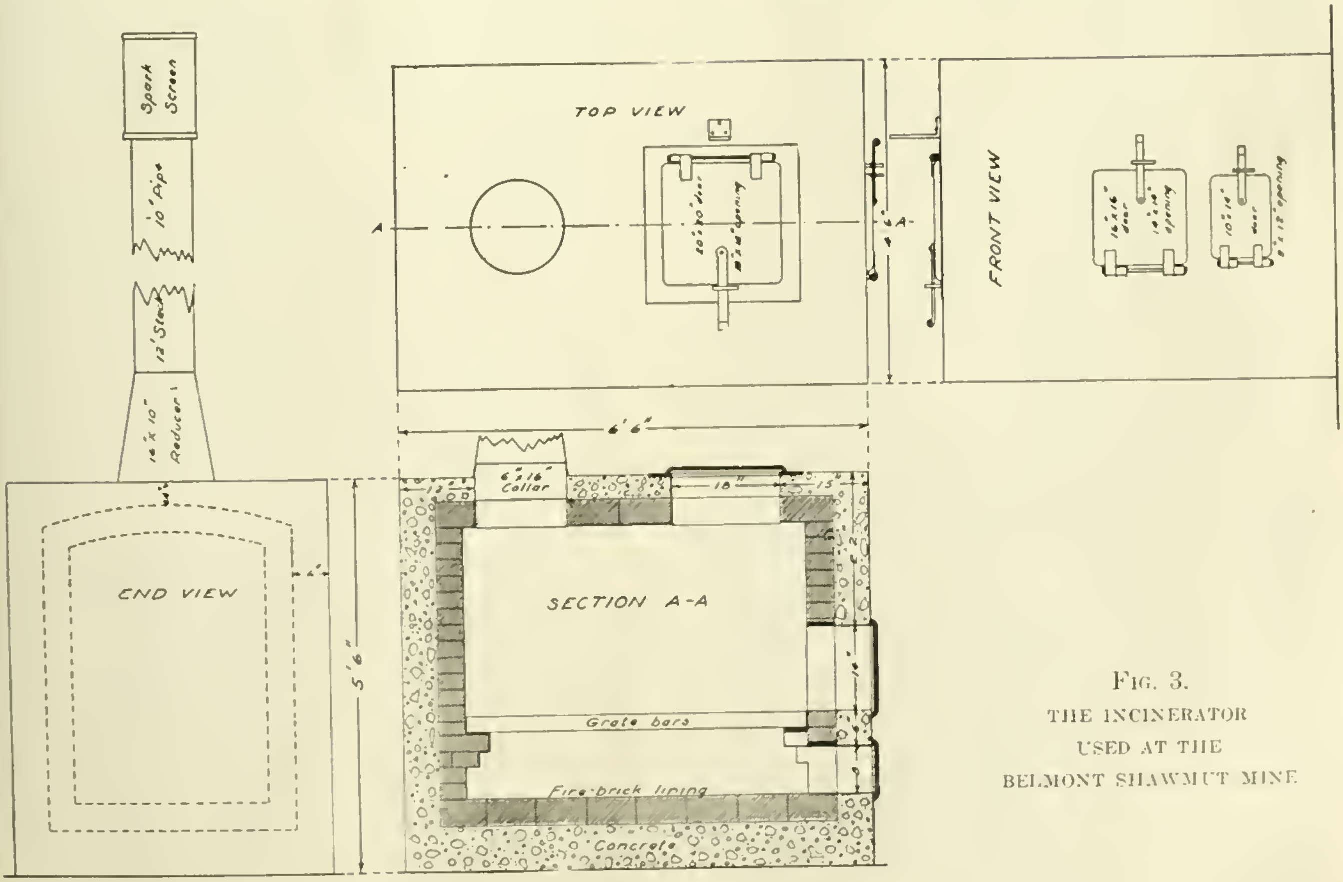

FIG. 3. THE INCINERATOR USED AT THE BELMONT SHAWMUT MINE

Social Betterment in Arizona

By A. M. HECKMAN

Metal-mining operations have probably been the most backward of any of the great industries in the recognition of the influence of sociological conditions upon their work, probably due to the fact that the development of large-scale organizations has been so gradual. Mines are not found in the centres of population where recreational and educational facilities are at hand. Most of the big industrial enterprises of the eastern portion of the United States were established after the cities had taken root, and their problem of providing a proper environment for their employees was but to assist in the continuation of those already available. On the contrary, metal mines are found in the wilderness, and the towns grow around them; the welfare work necessary in such a community must start from the ground.

The reason for a comparatively small amount of welfare work in metal-mining communities has been due partly to the fact that everything was subordinated to the winning of the metals. The conditions under which the workmen spend hours per day, their living conditions, their sanitary conditions, their houses, were often thought to be of secondary importance, but recent years have seen a remarkable change, both in the attitude of the mining companies and of the employees.

Not long ago, when mining operations were almost entirely on a small scale, the boss knew every man by his first name, he knew whether Johnny or Mary was ill and how they were getting along at school. With the growth of individual operations, however, the time has come when the man at the top deals with the man at the bottom through a series of departments. In such large organizations it is impossible to retain the personal touch that is given to the workman of an earlier period, and this personal touch, enabling the workman to feel that he is really something more than a cog in the machine is the important factor today.

There have been other notable factors, such as the changes in the character of labor and the multiplicity of nationalities coincident with large operations. The larger the number of nationalities, the greater the number of groups or clans.

While undoubtedly there has been an immense financial loss in the numerous strikes that have occurred all over Arizona during the past year, it is believed by many that the ultimate result will be an improvement of conditions. The mine-operator had thought that he had done everything that he could, but when the strikes broke out he began to think whether he really understood the other fellow's side of the controversy.

From the activities that have followed the strikes it is evident that there has been an awakening to the real need for welfare work. It is not a direct result of the strikes, but rather an indirect one; it does not involve giving to the men all the things for which they struck, for when men strike for better conditions they themselves are unable to define what they really want, and it remains for the operator to determine what fairness demands. I do not believe that there is one large operator in Arizona who is so narrow or so prejudiced that he would not immediately grasp any possible suggestions for the improvement of social conditions.

Personnel work is a term recently introduced to cover the great variety of activities in industrial work that deal with the human factor. Much attention has been focused upon individual phases of personnel work, such as accident prevention, sanitation, and reduction in the turnover of labor. In most cases these activities have been carried on as though they were distinct and separate; as a matter of fact, they are only phases of the one fundamental problem of human engineering, and each has important relations with the others. Thus, for example, a high turnover is one of the most important causes of a high accident rate, and unsatisfactory housing conditions are an important cause of labor turnover. In the early stages of the investigation, it was necessary to take each phase separately, the time has now arrived, however, at which it is desirable to consider them as a whole in order to bring them all into the right relation to each other.

A discussion of the importance of personnel work as a means of increasing dividends in industry may be objected to by some as a materialistic way of looking upon work that is humanitarian, but humanitarianism, as such, has no place in industry, and nothing is gained and much is lost by pretending that it has. The only reason why a corporation engages in business is to make a profit, and any activity of the corporation that does not tend either directly or indirectly toward that end is poor business. It is equally poor business to overlook any activities that do tend indirectly to the making of a profit. On this basis, personnel work can be justified as a corporate activity, even if there be no justification whatever for abstract humanitarianism from the business standpoint. One characteristic of the American workman is a high level of intelligence, and it is an insult to intelligence to ask a man to believe that anything so impersonal as a corporation is really desirous of benefiting him without advantage to itself. The inevitable result is suspicion and opposition. On the other hand, it is easy to make clear to the worker that he, as well as the corporation, benefits from personal work; thus his support can be won.

It must be kept in mind, as a major premise of this discussion, that through the rapid increase of invested capital in recent years and the much slower increase of labor supply, most corporations have already passed from the position of buying labor to that of selling employment. The difference needs no emphasis. The majority of important industrial organizations are now in the position where they need more capable men than they can secure, and it has become essential to hold out inducements for capable men to enter their employ and to develop the capabilities of those they can get.

The industrial leaders have learned to recognize one of the greatest needs of the workman, namely, that of a place for recreational and educational purposes—a place to spend the leisure hour. As a result, we have the club and Y. M. C. A. organized for and run by the workmen, although the money for the original investment may have been furnished by the company. The Ray Consolidated Copper Co. has the Ray Con. club at Ray and the Nocyar club at Hayden; the Magma Copper Co. has the Magma club at Superior; the Phelps Dodge Corporation has the Morenci club at Morenci; the Old Dominion Co. has the O. D. library and club-house at Globe. Other companies have gone in the club-house idea through the Y. M. C. A. and commodious Y buildings are to be found at Bisbee, Douglas, Miami, Clifton, and Hayden. A number of the mining camps are providing excellent baseball for their workmen. Bands have been organized and good music is available. Parks are common, although the maintenance of parks often proves very expensive.

Another phase of welfare work, although it is not often regarded as such, has been the introduction of physical examination as a method of preventing illness and accident. There is probably no place where it is more important to prevent the spread of contagious diseases than in the mine. The physical examination has two most excellent results: First, the correct knowledge on the part of the man himself of his physical condition, the knowledge of his capabilities, his dangers, and his possibilities; second, the knowledge of the man's physical condition by the company, enabling them to place him where his work will not be injurious to himself, and in the case of a man having a contagious disease, preventing the spread of that disease among the other workmen.

The introduction of medical and physical examinations of new employees is one of the greatest steps toward placing a premium on health. Take, for instance, a college boy preparing for engineering work: if you let him know that his whole future carreer depends upon his living a clean life, it will do more toward raising the standard of college morality than many reforms that might otherwise be instituted. The Army and Navy require it, so why should not employers, especially in view of the liability of accidents occurring as the result of physical weakness.

Practically every mining district in Arizona has a building and loan association, the object of which is to enable the workman to own his own home: the money is loaned at low rates of interest; in the Warren district it is 6%.

Splendid welfare work is being done in this district, in which are three of the largest companies in the State, the Copper Queen branch of the Phelps Dodge Corporation, the Calumet & Arizona Mining Co., and the Shattuck Arizona Mining Co. Practically everything along recreational and educational lines has been provided by these companies. The Copper Queen has furnished the community with a splendid library, containing some 8000 volumes, and has subscribed for 26 daily papers and 91 magazines. The company buys all the books and pays all the expenses. The companies contribute generously to the Y. M. C. A., one of the most influential organizations in the district. The Y occupies two buildings, and is one of the finest equipped association buildings in the country. Directly outside of the Y building is a swimming pool, which has the greatest attraction for young and old alike. Among the educational activities of this association are the miners' educational courses, which are given with a view to training men for greater efficiency in their work and to qualify them for better positions.

In 1916 there was erected a fine Y. W. C. A. building, equipped with every modern convenience and comfort. This was a gift from the Phelps Dodge Corporation as a memorial to Miss Grace Dodge, who, at the time of her death, was national president of the Y. W. C. A. One member of the staff works entirely among the Mexican girls and women of the city, teaching them home duties, English, conservation, and the use of substitutes. The association has also established a camp in the Huachuca mountains, where the girls may enjoy a vacation at nominal expense.

For a number of years the companies of the Warren district have had a pension system. The benefits of this system apply only to employees who have been 15 years or longer in the service of the company, and who are in either of the following classes: employees who have become mentally or physically disqualified, and those who have attained the age of 70 years. The amount of the annual pension allowed is 2% of the average salary of a man for the three years of active service immediately preceding his retirement, multiplied by the number of years of his service in the employ of the company. The maximum amount is in no case more than 60% of such average salary, nor is it ever more than $1000.

A Benefit Association for health and accident insurance is supported by the companies of this district. The Phelps Dodge plan is as follows: The object of the Association is to provide its members with a certain income when sick, or when killed or disabled by accident suffered on duty, and to pay to their families certain definite sums in case of natural deaths; to create and maintain a fund that belongs to the employees to be used in payments of benefits to them, and to cost them the least money possible, considering the benefits received. The dues of this Association are 1¾% of the daily wages received.

On January 1, 1918, the companies in this district announced a bonus system for tenure of service, and on that day $287,000 was distributed among the workmen of the community, $100 going to each underground man who had been in the employ of the companies for one year and $50 to those that had been employed for six months. Similarly the sums of $60 and $30 were given to surface men. In July the plan was announced as a permanent feature with a few changes. The six months' bonus has been eliminated, but now all employees who have been with the companies for a year will receive $100 on the completion of that year's work, with the addition of $10 for each year of service, $250 being the maximum.

This is a method of recognizing faithfulness in service, for there is no question that the number of men who stay with a company for a year or more are more efficient, they reduce the labor turnover and thereby increase the profit of the company. The distribution of a bonus to these men is but a division of the extra profit derived from their continuity of service.

The latest welfare activity is a new housing scheme, which was announced a short time ago by the Copper Queen branch of the Phelps Dodge Corporation and the Calumet & Arizona Mining Co. This provides that the companies will build houses for their employees on plans provided either by the employees or the companies, and will sell them to the employees on terms of rent, with interest on deferred payments at only 6%. No charge will be made for house-lots. The land set aside for the new homes is in the most attractive residence section of Warren, within easy distance of the mines.

The above are a few of the many things that the mining companies in Arizona are doing to ameliorate the life of their workmen. We can look for immense changes in social conditions, for the operators appreciate that it is an important factor in their success.

Gold mining in British Guiana has fallen off considerably since the War began, according to a recent U. S. Consular Report. Foodstuffs, implements, machinery, and labor have been costing so much that the industry has not been profitable. In fact, a gradual decrease in the quantity of gold obtained from the mines has been taking place during the last 25 years. In 1893, which was the best year, 137,629 oz. was won, valued at £512,000 ($2,492,000), whereas the return in 1917 was only 29,538 oz., worth £108,016 ($525,660). The difficulty in obtaining labor for the workings has had perhaps more to do with the decline in the output of gold than any other cause. The sugar and rice lands, near the coast, attract labor rather than the mines, which are in the interior of the colony or at least pretty far inland, and the rate of wages paid on the sugar estates is higher. Labor has also been attracted by the recent boom in bauxite mining, which has reduced that available for gold. There is strong confidence still in the gold industry, which is supported by the Geological Department, and a belief that with the proper opening of the colony a great future is in store for it. At present undoubtedly gold mining must be considered a waning industry. In addition to the labor difficulty it is probable that the machinery and methods employed leave much to be desired, and may account for present conditions.

Gold Situation in Australia

A conference of Australian gold producers was to be held at Melbourne during the third week of January, when the following proposals were to be discussed: (1) That a Gold Producers Association with a central committee be formed to look after the special interests of Australian gold producers. (2) That this Association demand the removal of embargoes on the export of new gold. (3) That the Federal or Imperial governments pay a subsidy on gold production proportionate to the increase in working costs since 1914. (4) That the Repatriation Department subsidize the employment of returned soldiers producing low-grade and otherwise unpayable gold ores. (5) That the Repatriation Department subsidize tribute [lessee] parties composed of returned soldiers. (6) That the Association organize the co-operative buying and distribution of all gold-mining stores. (7) That the Federal government subsidize the State Railway Departments to allow of the carriage of stores at reduced rates. (8) That the Commonwealth government be urged to encourage gold prospecting by (*a*) removal of restrictions on the flotation of gold mining companies; (*b*) subsidies to prospecting parties consisting of returned soldiers in west, north, and central Australia; and (*c*) construction of dams, wells, waterbores, and other means of conserving water in west, north, and central Australia to serve the gold and pastoral industries.

Metal Output of British Columbia

A preliminary review and estimate of production of British Columbia during 1918 has just been prepared by the Department of Mines. The accompanying table shows that the mineral output was valued at $41,083,093, a gain of 11% when compared with 1917.

	1918		1917	
	Quantity	Value	Quantity	Value
Gold, placer, ounces	15,400	$308,000	24,800	$496,000
Gold, lode, ounces...	157,276	3,250,895	114,523	2,367,190
Total gold	172,676	$3,558,895	138,323	$2,863,190
Silver, ounces	2,886,861	2,601,120	2,929,216	2,265,749
Lead, pounds	43,919,661	2,944,627	37,307,465	2,951,020
Copper, pounds	63,387,010	15,681,946	59,007,565	16,038,256
Zinc, pounds	36,149,894	2,501,573	41,848,513	3,166,259
Total metals......	....	$27,288,161	....	$27,284,474
Coal, tons	2,292,068	11,460,340	2,149,975	7,524,913
Coke, tons	190,656	1,334,592	159,905	959,430
Total collieries. ..	....	$12,794,932	....	$8,484,343
Miscellaneous	....	1,000,000	....	1,241,575
Total production .	....	$41,083,093	....	$37,010,392

The increase in gold output is rather a surprise, yet the yield for 1917 was abnormally low. The Belmont Surf Inlet mine was a large contributor in 1918, yielding 43,000 ounces.

Duty payable to the government of Siam by tin companies is from 10 to 25.2%, depending on the price of Straits tin. In the Federated Malay States the duty is from 10 to 14½%, ad valorem.

REVIEW OF MINING

KAMLOOPS, BRITISH COLUMBIA

Three Gold Mines in the Cadwallader District.

One of the promising gold properties of the Cadwallader Creek district, Kamloops mining division, is the Lorne mine. During the past year, owing to abnormal conditions, work has been confined largely to development. This work yielded 380 tons of ore, producing 192 oz. gold and 37 oz. silver.

The Pioneer mine is another gold mine in the Cadwallader district that has been operated steadily during the greater part of the past year. Milling was started on March 10 and ceased July 21. Sinking of a shaft was continued from the latter date, and is now down 280 ft. from the collar. Driving has been carried on at the 280-ft. level for 120 ft., and good ore opened. The head-frame, hoist-house, and blacksmith-shop were destroyed by fire on November 17, but milling is expected to be resumed in a short time. Gold produced during 1918, up to November 16, totals 1925 oz. It is estimated that the output to the end of the year will total 2500 ounces.

IDA MAY MILL PIONEER MINE LORNE MINE

THESE PROPERTIES ARE IN THE CADWALLADER CREEK DISTRICT OF THE KAMLOOPS MINING DIVISION, BRITISH COLUMBIA

At the Ida May mine, also in the Cadwallader district, a reduction plant consisting of a small jaw-crusher, Huntington mill, with a capacity of 10 tons per day, and an amalgamating table, was erected during the past year. Power is supplied by a 10-hp. gasoline engine. A trial run gave 30 oz. of gold. The property is now closed, but is expected to re-commence operations in the spring.

WINNIPEG, MANITOBA

Possibilities of Northern Manitoba.

The Commissioner of northern Manitoba, R. C. Wallace, has issued a statement concerning operations of the Mandy company, a subsidiary of the Tonopah Mining Co., at Schist Lake, north of The Pas. During 1917, the company shipped 3300 tons of ore, containing copper valued at $261,360, gold, $6600, and silver, $6600; a total of $274,560. In 1918 shipments of ore were 6000 tons, containing copper, $624,000; gold, $12,000; and silver, $15,000; a total of $651,000. Production of copper for the two years was 3,588,000 lb. The company has mined 12,000 tons for shipment in 1919, and almost completed the stoping of high-grade ore to the 200-ft. level, and has blocked out 200,000 tons of low-grade ore. It is expected that 15,000 tons will be shipped during the coming summer. Mining men are urging upon the Manitoban government construction of a railway, which would be an extension of the Canadian Northern, to open the copper properties in this region, one of which, the Flin-Flon, has ore blocked out estimated to be worth $200,000,000.

BISBEE, ARIZONA

Stripping Overburden.—Employment.—Bonuses and Living Conditions.

All records for stripping overburden on Sacramento hill were broken by the Copper Queen company on January 8, when in a 16-hour day, 433 carloads of rock was loaded. This amounted to more than 7000 yards, or an average of a trainload of four cars every 9 minutes. The best previous record was 6000 yd. in 16 hours. In an 8-hour shift on January 9 even greater speed was made, an average of a trainload every 5 minutes being maintained. December was the best month on Sacramento hill, a total of 140,314 cu. yd. being moved, or a daily average of 4800 yd. The January record, as indicated by the two days mentioned, should not be far from 180,000 yards.

Enlargement of the C. & C. shaft of the Copper Queen from the surface to the 1000-ft. level has been completed, and work has been started cutting a large pumping-station at the 800-ft. level. Within a short time everything will be ready to start sinking a standard 3½-compartment shaft from the 1500 to the 1800-ft. level. The new head-frame and hoist have been erected.

Contrary to reports, it was announced by the Copper Queen that it was discharging no men at present, aside from the ordinary turnover. The present policy of the company in employment, and it is the same with the Calumet & Arizona company, is to take on only returned soldiers, sailors, or war workers, or men who had been employed by them during the last two years and who had worked for them for two years. The Night Hawk Leasing Co., operating at the lower end of the Warren district, reports that it now is working along the fault on the 450-ft. level with an increasingly good showing. In the raise on the main fault the workings have opened lenses of mineralized ground, carrying streaks of rich copper ore. Indications appear to favor finding an orebody at an early date. The property now is looking better than ever.

The Copper Queen company and the Calumet & Arizona company paid the second annual bonus to employees on the first January pay-day to 1354 men at Bisbee, putting $153,040 additional money into circulation. The Copper Queen bonus-roll at Bisbee and Douglas included 1400 men, 877 of whom were at Bisbee. Of this number 834 received the second annual bonus of $110, while 43 received the first $100. The Calumet & Arizona bonus-roll at Bisbee was 520 men, 500 of whom received the second-year bonus and 20 the first year's. Under the plan in effect with both companies, the bonus becomes due and payable at the end of the year's employment of each individual employee. However, as the bonus payments began January 1, 1917, the largest single month of the year is January. The men receive a sum ranging from $100 for the first year to $250 at the end of 15 years, at the end of which time they are retired under pension. In conjunction with the payment of the annual bonus, attention was called by the companies to the fact that the Third Addition to Warren, a residential suburb of Bisbee, opened recently for the benefit of employees of the mining division of the Phelps Dodge and C. & A. companies, in conjunction with the bonus, offered a study worth consideration of the men. The annual bonus, intended as a reward for faithful service of the men, is sufficient in amount to cover the interest on the average amount expended on a home in the suburb. The companies, through the Warren company, a joint subsidiary, are loaning money to employees, charging only 6% annual interest, to be expended on homes in the Addition. The principal and interest are to be repaid to the Warren company in 100 monthly payments. Taking $2000 as the average amount expended on a home in the Addition, the first year's interest, roughly figured, without taking into consideration monthly reductions in principal which would affect it, would be $120. Thus the first year's bonus would lack but $20 of paying the interest, while the third year's bonus would cover it. At the end of the eighth year the bonus would have brought to the employee a total of $1160; at the end of 12 years it would have reached a total of $1960, and at the end of the 15th year he will have received $2230, or more than the cost of his home. Eighteen houses have been completed in the tract, or are under construction, but at present the Addition is not being pushed. It is the belief of the company officials that building material and labor, high while the War was on, have passed their highest and soon will be obtainable at more reasonable figures. In the meantime, grading, laying of water and sewer-pipes, erection of electric lights and telephone poles, and other betterments are being pushed. In the houses themselves the conveniences of the wives of employees is being studied; built-in features, sanitary plumbing, and 'step-saving devices' are being installed by the architect in charge. The Addition will be open to none except the men actually employed in the mining division, according to official announcement, although efforts are being made to secure rulings that would permit office-men and employees of subsidiary corporations to enjoy the advantages of the scheme.

CRIPPLE CREEK, COLORADO

Notes on Some of the Small Mines.

A rich strike is reported from the 600-ft. level of the Dante mine, on Bull hill, by Craig and Horn, sub-lessees of the Big Toad company. The core of the 4-ft. vein, a streak 2 to 4 in. wide, is worth 50 cents per pound. The screenings from the entire orebody assay 5 oz. per ton.

Operations will be resumed on the Midget and Bonanza King mines of the Midget Consolidated on Gold hill by the Backof Leasing Co., of St. Louis, early in February. The property has been closed since December 1917. The old sub-lessees, nine sets, who were in ore when the mine was closed, will return to work

H. M. Gilbert of Cripple Creek, with Chicago associates, has secured a 3-year lease on a large block in the Index mine of the El Paso Extension Gold Mines Corporation, on the south-western slope of Gold hill, extending from the 600-ft. level to surface. Driving north from the 600-ft. level of the Index shaft to the Anchoria Leland-Index line has been started on the main Index vein. The drift will pass through undeveloped ground, traversed by three known veins—the Index, Keystone, and Pointer, also the Index basalt dike. All of these veins and the dike have been big producers.

A fifth interest in the Hayes-Cartee lease on the Vindicator company's 1100-ft. level, which has produced $200,000 since last April, has been sold by Pete Cartee to W. E. Craig for a cash consideration not made public. Cartee has purchased a ranch in Missouri with the profits accruing from his lease.

The properties of the Gold Dollar Consolidated Mining Co., comprising 64 acres on the eastern slope of Beacon hill, will be sold by the Sheriff of Teller county on February 15, under a judgment issued from the District Court, in favor of the First National Bank of Cripple Creek, in the sum of $16,310.45, with interest and costs.

DURANGO, COLORADO

General Notes From the San Juan Region.

Silverton.—The Sunnyside M. & M. Co. has purchased the Gold Prince mill at Animas Forks. The intense cold that has prevailed during the past week caused some delay in starting the plant and mining operations generally.

The North Star mill and mine is under lease to M. De Golyer, the tungsten operator. Men have been at work for several months re-modeling the mill to dress tungsten ore.

Development continues at the Buffalo Boy. The litigation that involved the property, tieing-up operations for a number of years, is practically settled. Plans are under way for a season of heavy production, with a return to the former status. A strong organization is backing the project. Among other exploration is the driving of a tunnel under the present workings, cutting the vein at depth.

The Henrietta company proposes to drive a tunnel from the Cement Creek side to the Joker Tunnel side of Red mountain, cutting through large veins and having two points of shipment, the Gladstone branch, or the Red Mountain railroad.

The D. L. & W. Co. has almost completed the extensive development on the Lackawanna necessary to shipping ore. Re-timbering and driving a cross-cut tunnel to give access to a large area of stoping ground has been done; a tram has been built also. Plans are being drawn for a mill.

The Anvil Leasing Co. is driving a tunnel to cut a large vein on the Emerald lode. Shipments are being resumed from the Diamond lode.

Telluride.—Heavy production continues from the Tomboy and Smuggler Union mines. Although difficulty is being experienced with drifting snow on Lizard Head on the Rio Grande Southern, there has been no serious interference with traffic. The movement of live stock, which has held up ore movement, is now completed.

Ouray.—Ouray Consolidated continues development of its various holdings. Extensive work is now under way in the Guadeloupe, a large body of high-grade copper ore, for which the mine is noted, having been opened. Since the Red Mountain railroad has suspended running, the ore is packed to Ouray by mule-team. A tram will be constructed in the spring to facilitate removal of ore.

Rico.—The Standard Chemical Co., at Naturita, has erected an electric plant to provide light for all workings. A large reservoir has been constructed to provide a continuous supply of good water.

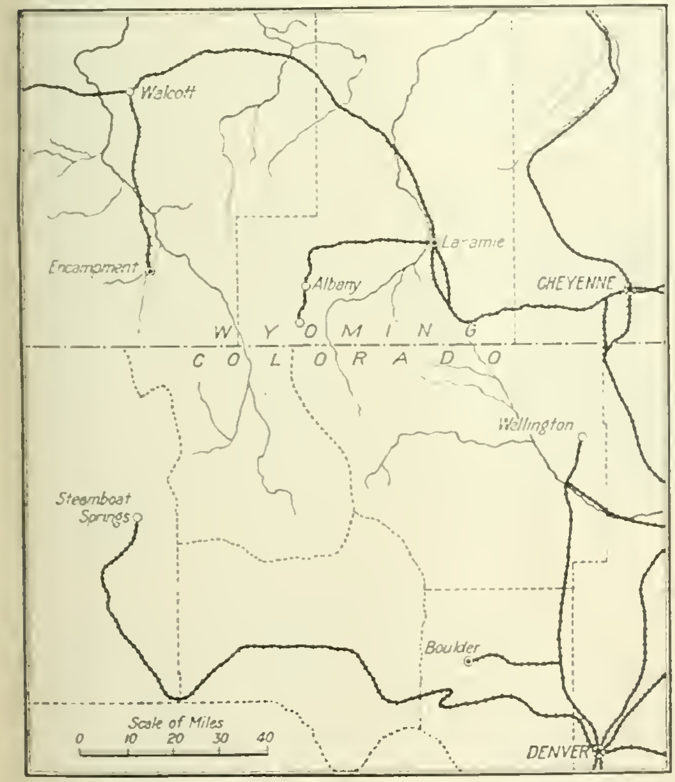
DENVER, COLORADO

Further Notes on the Copper Mines at Encampment, Wyoming, and Possibilities of Their Being Re-opened.

In the 'Press' of January 4, under the above head, was given some details of the Ferris-Haggerty mine in Wyoming, and something of the life at Encampment in 1896 and later. The latest concerning the properties there is that the Morse Bros. Machinery & Supply Co. of Denver has purchased the entire assets of the Penn-Wyoming Copper Co. at Encampment, owners of the Saratoga & Encampment railroad, the Ferris-Haggerty and Doane-Rambler mines at that place. The various subsidiary companies purchased and their respective bond issues are as follows:

Ferris-Haggerty Copper Mining Co.	$1 000 000
Battle Lake Tunnel Site Mining Co.	750,000
Saratoga & Encampment Railroad Co	750,000
Encampment Smelting Co.	500,000
Encampment Tramway Co.	350,000
Encampment Pipe Line Ditch Co.	100,000
Emerson Electric Light Co.	50,000
Encampment Water Works Co.	50,000
North American Mercantile Co.	22,000
Carbondale Coal Co.	20,000
Encampment Town Lot & Land Co.	8,000
Total	$3,600 000

The capital of the Penn-Wyoming Copper Co. was $10,000,000. This company was the successor of the North American Copper Co., the promotion of W. G. Emerson, who recently died at Los Angeles, California. The Penn-Wyoming company took over the property in 1904, and operated it under the most unfortunate conditions of fire losses and financing of the railroad until 1907 when it was closed. Numerous attempts have been made to reorganize and resume operation. Dissensions arising during the efforts at reorganization, a receiver was appointed, and litigation commenced which only ended in the Court of Appeals, the property sold to the Bondholders Protective Committee and the purchase by the Morse Bros. company from them brings the history to date. The mine produced over 10,000,000 lb. of copper from its discovery in 1898 by E. Haggerty.



PART OF WYOMING AND COLORADO, SHOWING PLACES MENTIONED IN DENVER LETTER

The records of the Penn-Wyoming Copper Co. show a production of 6,414,011 lb. from 59,000 tons of ore mined, or 107.18 lb. of copper per ton recovered. From 1904 until operation ceased in 1907, the plants worked a total of 372 days during this period. In 1906 the concentrating and power plant was destroyed by fire and re-built and put in operation the latter part of March 1907, and operated until May 10 of that year, when the smelter and tramway terminal were burned. These plants were re-built and commenced in May 1908, and operated until closed in October of that year owing to financial difficulties occurring through the building of the Saratoga & Encampment railroad, which connected the smelter at Encampment with Walcott, Wyoming, on the main line of the Union Pacific railroad. Previously, all of the coke and supplies were hauled in and the finished product hauled out to Walcott, the nearest railroad point, 47 miles distant.

The tramway connecting the Ferris-Haggerty mine with the smelter at Encampment is one of the longest, if not the longest, aerial tram in the world, the distance being 16⅞ miles. It is operated in three sections, with a power-plant for each. There are 304 towers, tension, and anchor stations, 884 buckets, and 63 miles of wire rope. The track cables are 1¼ and 1 in., and the traction cable ⅝ and ¾ in. The cost of operation during the period was 93.47 cents per ton of ore handled.

Twelve cars of ore shipped from the Doane-Rambler mine in 1901 averaged 40.7% copper, and exhibits of ore from this mine at the St. Louis Exposition carried 900 lb. or 45% copper per ton. These ores were bornite and chalcocite. This mine was bought to supplement the production of the Ferris-Haggerty and has been developed to a depth of 665 ft. from the surface. No ore being taken out from the lower levels, as development was in progress at the time of closing. A great deal of the ore from the Ferris-Haggerty was hauled a distance of 60 miles to Walcott, and none of the Doane-Rambler ore was shipped that could not stand this transportation.

The Saratoga & Encampment railroad runs directly south from Walcott to Encampment, which is at the foot of the Continental Divide, at one of the lowest passes in the range. A survey has been made to connect this line with the Moffat road at Steamboat Springs, a distance of 60 miles on a 2% grade and a maximum altitude of 8500 feet.

The geological features of this district, many of which are interesting, are fully described in Professional Paper No. 25, by A. C. Spencer of the U. S. Geological Survey, published in 1904.

An effort will be made by the purchasers to prove the value of the mines, and have them operated if investigation will warrant the expenditures necessary. The smelter and concentrating plants at Encampment will be dismantled and material sold, as mills will be built at the mines and the concentrate transported to Encampment rather than hauling the crude ore, as mill-sites and water-rights are available at both the Ferris-Haggerty and the Doane Rambler mines.

PLATTEVILLE, WISCONSIN

Conditions in the Zinc, Lead, and Pyrite Mines and Markets.

The close of 1918 brought to zinc-mine operators in the Wisconsin fields conditions and prices that were sufficient to unnerve the most courageous. High-grade blende from refining plants, which had been sold for several months under agreement at $75 per ton, gave way to lower figures. Two large smelting firms continued to buy this grade, paying $55 and $50, respectively. On second grades the price at the beginning of December stood at $47.50, from where it fell to $42.50, with demand rather indifferent. Most of the ore was sold at this price, but sales were as low as $40. These figures were unsatisfactory and shut-downs were numerous. Severe weather made production difficult, and roads were so bad that some producers were isolated for a week at a time. There was also a scarcity of cars.

Lead-ore producers were also in a bad way, the price of ore dropping from $80 to $60 per ton. Demand was poor. Production fell off appreciably on account of cold weather.

Pyrite shippers remained out of the market nearly all December, prices and demand being unsatisfactory. The refining plants in the field where much of this class of ore is recovered were fairly well occupied, and there was held in reserve at the end of the year several thousand tons of fine. There are three sulphuric acid plants in the field, but only one is in operation at present.

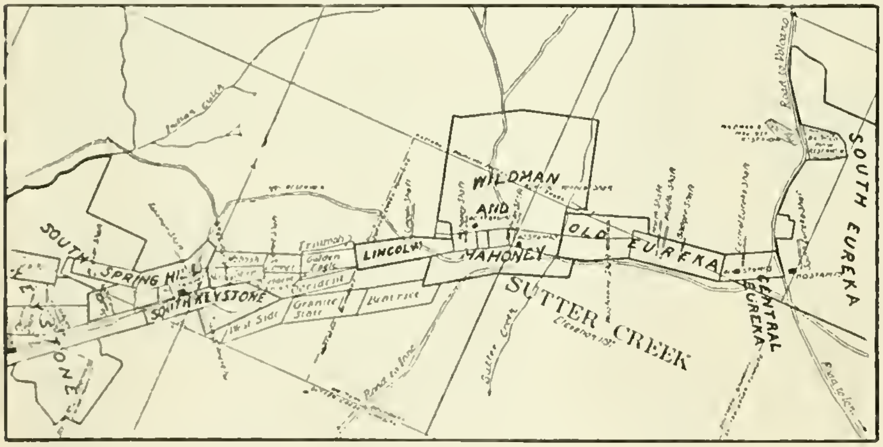
Satisfactory developments were made during December in the northern districts of the field for the New Jersey Zinc Co. Carbonate of zinc in heavy blanket formations was found at shallow depths permitting cheap mining.

Gross recovery of zinc ore for December totaled 11,281 tons; net deliveries to smelters, including high-grade blende from local refining plants, 4853 tons. Conservative and reliable estimates show a reserve at all points in the field at the close of 1918 totaling 7500 tons of zinc concentrate, all grades; iron pyrite, 3000 tons; and lead, 500 tons.

SUTTER CREEK, CALIFORNIA

Encouraging Reports from the Central Eureka, Old Eureka, and Keystone Mines.

Developments on the lowest level of the Central Eureka mine are most encouraging. The winze sunk below the 3500-ft. level continued for 100 ft. in ore of excellent grade; then the vein turned slightly, and rather than make a bend in the winze, it was decided to cut a station and ore-pocket at that point and begin driving on the ore. This work is new well under way both north and south from the winze. The south drift is out 40 ft. in ore averaging $40 per ton, and the north drift 28 ft. long, in ore averaging $17. The north breast shows 8 ft. of $30 ore, and there are splendid indications of the good value continuing for some distance. These drifts will be extended far enough to ensure ample stoping area from this winze-level. In the meantime the ore extracted from driving is raising the grade of that from stopes above the 3500-ft. level, showing well in the mill. Excepting necessary repairs to the shaft and upper levels all work is confined at present to the 3500-ft. stopes and the two drifts from the winze 100 ft. below. The orebody now being worked on the lowest levels was found to apex on or near the 3425-ft. level. The vein is far less broken than near the point of discovery, and all signs point to persistence. The Central Eureka has had a long hard struggle for many years past—scarcity of labor, excessive costs, and apparent meagre ore-reserves proved most discouraging. The closing of the adjoining South Eureka mine, necessitating the Central company taking over the entire pumping expense for the two properties, added seriously to the maintenance charges, and during the last year in particular, assessments have been levied with heart-breaking regularity. The new development, however, bids fair to soon put the property on its feet; in fact, a fair profit is anticipated for this month's run, and it will be only a short time until sufficient ore is blocked out to warrant dropping the 40 stamps instead of 20 now. Albion S. Howe is superintendent, and W. J. Bryant underground foreman of this mine.



PART OF THE MOTHER LODE IN AMADOR COUNTY, CALIFORNIA

The above developments in the Central Eureka mine have brightened prospects for the Old Eureka adjoining. The new orebody in the Central is 350 ft. below the present bottom of the Old Eureka shaft, and 160 ft. from its boundary-line. The Old Eureka shaft is now down 2900 ft., and is being extended at the rate of about 20 ft. per week. The company now feels encouraged to continue sinking for several hundred feet more, even should the ore opened on the upper levels not come up to expectations. A north drift on the 2100-ft. level is in 480 ft. from the shaft, while the south drift has reached 660 ft. Considerable ore has been found in both directions, that to the north being higher in grade than that in the south. Preparations are also under way for considerable work on the 1200-ft. level, where ore of good grade is showing, and indicating that a large body may be uncovered. With these levels to draw from and the more persistent orebodies that the history of neighboring mines lead the owners to expect when greater depth is attained, a bright future for Hetty Green's old mine seems assured. The Old Eureka company has already spent a large sum in equipping and re-opening this old producer, and the faith in the property is evidenced by the substantial character, of all construction. A cross-cut is being driven at this time on the 500-ft. level to prospect an old ore-zone, and the intention is to construct an emergency dam at that point later; other improvements are contemplated. T. C. Gorrie is general manager of the Old Eureka and T. J. Donovan has charge of underground work. The recent improvement in the labor situation means much to the Old Eureka, and better progress will be made from now on.

During the past six months the old Keystone Mines at Amador City have kept up the struggle against adverse conditions, and added over $100,000 to the gold supply. On ore the gross value of which was less than $2.52 per ton this mine not only paid expenses but added something to its sinking-fund. Forty stamps of the mill were steadily operated during the six months, during which time there was crushed 44,322 tons of ore, producing $4652 in bullion and $106,860 in concentrates. Freight and smelter charges reduced the total to $85,516. While a small amount of ore was hoisted during the half-year from the 1000 and 2100-ft. levels, most of it came from the 1200, 1400, and 1800-ft. levels. Operations at 900, 1000, and 1200 ft. have been discontinued until more extensive prospecting can be done. On the 1400-ft. level, the south drift has been in ore for 45 ft., with several feet of milling ore in the face. Stoping is in progress at two points in the north workings. Some stoping is also under way on the 1800-ft. level. At 2100 ft. the east cross-cut has been advanced 543 ft. east of the shaft. At 360 and 468 ft. from the shaft ore has been found. Carlton R. Downs is managing this property, which has been in constant operation since its discovery in 1851; B. I. Hoxsie is supervising underground operations.

THE MINING SUMMARY

ALASKA

A joint resolution by Senator Jones of Washington, suspending assessment work on mining claims in Alaska for four years beginning with 1917, was passed by the Senate at Washington on January 20 and sent to the House. It also would extend to mining claims of Alaska the provisions of the acts suspending for two years the requirement that $100 worth of work be performed each year on claims, and exempting from the requirement those who served in the War.

ARIZONA

Humboldt.—Consolidated Arizona Smelting produced 1,060,000 lb. of copper in December. The monthly average in 1917 was 1,550,000 pounds.

Jerome.—The Jerome-Portland company has been reorganized as the Jerome-Bisbee. The receiver has been discharged. George Brookshire is president and L. H. Beyerle is secretary. A 500-ft. shaft has been sunk and 2800 ft. of other work done.

Mayer.—The Arizona Binghampton Copper Co. recently issued a report detailing the director's meeting and including the examination of the property by Horace V. Winchell. In over two years the flotation plant has concentrated 90,000 tons of ore, while 922 tons of high-grade was sent to smelter, the total being nearly 5,000,000 lb. This is equal to 3% ore. As low as 2½% was treated profitably. Reserves are estimated by Mr. Winchell as 100,000 tons of 3% ore and 150,000 tons of lower grade, all above the 600-ft. level. The total length of the ore-zone is 1400 ft. A new shaft is being sunk to 750 ft. depth, to be finished by June. The mill may be enlarged to 300 tons daily capacity, or double the present size. Generally, the possibilities of this mine are considered attractive.

The Big Bug company has erected a gasoline hoist and has sunk its shaft 75 of the 300 ft. contemplated. Some rich copper glance has been opened.

The Little Egypt is extracting enough ore to pay for development expenses. The old shaft is to be sunk to 500 ft. when the tunnel connection is made.

Ore has been found at 600 ft. in the Kay mine, probably an extension of the shoot worked at 500 feet.

Oatman.—United Eastern paid 5 cents per share, equal to $68,150, on January 27.

Superior.—Magma Copper Co. produced 1,049,783 lb. during December. The average for 1918 was 900,000 lb. per month, ranging from 560,000 to 1,169,000 pounds.

CALIFORNIA

Oil production during December amounted to 275,596 bbl. daily from 8606 wells. There were 41 wells completed during the month. In 1918, according to the Standard Oil Co., the total output was 101,637,870 bbl., equal to 278,460 bbl. per day. Stocks declined 407,542 bbl. to the present total of 32,042,923 barrels.

Angels.—The W. J. Loring interests have purchased the old Morgan mine, on the north-east slope of Carson hill, 4 miles south of Angels. The option was completed after considerable exploration was done. From 1898 to 1914 this mine, part of the estate of J. K. Fair of San Francisco, was idle. Some famous pockets of gold ore were found in the early days, one being worth $300,000. The ore is free-milling, and will be sent to the Melones mill.

Keswick.—The Mountain Copper Co.'s enlarged flotation plant at Minnesota station, midway between Keswick and Iron Mountain, is now in operation.

Cima.—The Piute silver-lead mine at Cima, San Bernardino county, has been acquired by the Nevada Mine Leasing & Holding Co. During 1917 this property was the largest silver-lead producer in the district, but the owners became financially involved in the latter part of that year and until the present time. The financial difficulties have been cleared, the new owners have started rehabilitating the old workings. The property is a regular producer and will shortly commence shipping again. The mine is developed by shaft and 2000 ft. of workings.

Coram.—The First National Copper Co., controlling the Balaklala mines, pays a dividend of 15 cents per share on February 25. This amounts to $90,000.

St. Louis.—Hydraulicking to be started here next spring will result in the ground upon which the town stands being washed away by the Loftus company. To restrain the gravel the company has a concrete dam across Slate creek.

COLORADO

Boulder.—J. G. Clark, general manager for the Boulder Tungsten Production Company, expresses confidence in a revival in the tungsten industry during the current year, and is especially optimistic of the re-establishment of his company on a producing basis. He is not only ready to announce plans upon which he has been working to put the company on its feet financially for work in the mines and the extension of a tunnel which is nearing the mineral-bearing zone, but is at this time confident that the plans will work out successfully in a short time.

Georgetown.—The Wide West Mining Co. has driven its tunnel a distance of 3000 ft.; it is also driving on several veins. A 24-in. track of 40-lb. rails and a 4-in. air pipe-line were laid. This tunnel is to explore the Colorado Central 1000 ft. below present workings. G. W. Hall is superintendent.

Idaho Springs.—During 1918 the Argo mill treated 19,700 tons of ore, settling with producers for a total of $328,348.

IDAHO

Kellogg.—Caledonia pays a dividend of 1 cent per share, equal to $26,050, on February 5. The total is now $3,725,150.

Leadore.—The Sunset M. & M. Co.'s new 40-ton concentrating plant is working well. Concentrate assays 44% lead and 36 oz. silver per ton. By adding more tables the capacity is to be increased to 80 tons. W. Van Wagenen is manager, with W. Fagregreen as mill superintendent.

KANSAS

Baxter Springs.—The Chanute Spelter Co., in charge of W. H. Eardley, has four pumps with a capacity of 3000 gal. per min. drawing water from drill-holes, and as the water is lowered a shaft is sunk The shaft is going down in limestone, following a dry hole. Much interest is being taken in this method.

MICHIGAN

Houghton. It is reported that copper production in this district is to be curtailed as in other parts of the country.

Copper outputs of the Calumet & Hecla group in December were as follows: Ahmeek, 1,761,823 lb.; Allouez, 543,988; C. & H., 5,533,690; Centennial, 195,021; Isle Royale, 1,601,244; La Salle, 130,670; Osceola, 253,254; Superior, 109,875; and White Pine, 110,141, a total of 10,539,706 pounds.

MISSOURI

Joplin. Production of the Tri-State region last week was:

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	965	. . .	12	$44,328
Missouri	497	59	145	32,957
Oklahoma	5,363	. . .	830	280,409
Average price.	$45	$34	$60	. . . . . .

MONTANA

Kendall. Barnes-King Development Co. pays 10 cents per share, equal to $40,000, on February 15. This makes a total of $300,000. The December gold yield was $45,400, from 4627 tons of ore. The labor situation is much improved.

NEVADA

Carson.—The biennial report of the State inspector of mines, A. J. Stinson, for 1917-'18, has just been published. In the 96 pages are statistics of production, warnings to certain mining companies, accidents, and a list of properties in the various counties. There were 26 fatalities during the year ended November 30, 1918. The average number of men employed in mines last year was 6295, an increase of 204 compared with the 1917 total. Expenditures of the Inspector's department in 1918 totaled $12,442.

Ely.— The old Taylor mine in the Ward district, 15 miles south of this place, is to be re-opened by the W. S. Bennett of Cody, Wyoming, representing Wyoming and South Dakotan people. The copper ore is said to carry a good deal of silver. A mill may be put up to treat dumps.

Goldfield.—The Goldfield Consolidated was to close its mines and mill on February 1, but it is proposed to re-open all of the mines on a leasing system.

Kimberly.—The Consolidated Coppermines Co. states that the note in the 'Press' of January 11 to the effect that the Pilot-Knob mill is to be shut-down on account of unprofitable operation, and that the mill-heads have been running less than 1% copper, is incorrect. The plant on Pilot Knob was re-modeled as an experimental mill to determine a flow-sheet for design of a larger unit. On account of its position, design, and the water condition obtaining at Kimberly it was never intended that the Pilot Knob be run over any protracted time. Owing to the present condition of the copper market, and also that it is no longer necessary to operate this unit for testing purposes, it was deemed expedient to stop this work. During the last three months of 1918 the mill-heads averaged 1.29% copper, while at the time the plant stopped the ore carried 1.5%. H. S. Munroe is general manager.

Pioneer.- The Consolidated Mayflower Mines Co., in charge of J. B. Kendall of Goldfield, will soon be in the market for a ball-mill, to be used in its plant at Pioneer.

Thompson.- Mason Valley produced 1,273,176 lb. of copper during December, well up to the average.

Tonopah.— Production of the district last week was 7168 tons of ore valued at $121,856.

Tonopah Mining Co. in December treated 6514 tons for 101,605 oz. of silver and 1135 oz. of gold, and a profit of $38,000.

A geological description of the Divide district has been prepared by A. H. Elftman for the Rosetta Divide Mining Co. The rock formations are, he says, a continuation of some of those found in Tonopah mines. The character of the veins and conditions of mineralization in the two districts are somewhat different. The Divide breccia, in which the main ore deposits occur, have not been extensively explored at Tonopah.

'The Genesis of the Ores at Tonopah, Nevada', is the title of Professional Paper 104, just issued by the U. S. Geological Survey, written by E. S. Bastin and F. B. Laney. An abstract of this report will be given in the 'Press' later.

NEW MEXICO

Mogollon. The old Little Dry Creek gold-silver district, 20 miles south of here and 60 miles north-west of Silver City, is said to be receiving attention again. Several parties have uncovered good ore.

Santa Rita.—A company has been organized by C. A. Petterson of this place, and Chicago people, to take over the Log Cabin mine. A recent shipment of ore assayed high in lead, silver, and copper. Fourteen men are employed

TENNESSEE

Deposits of manganese ores in eastern Tennessee have been examined recently by G. W. Stose and F. C. Schrader, geologists of the U. S. Geological Survey, in co-operation with W. A. Nelson, State geologist, and Arthur McFarlan, assistant State geologist, of Tennessee. The deposits were studied systematically with a view to determining their relation to the underlying rocks and to the surface features and their probable extent and content of ore. The studies of the geologists and the exploratory work of the mining companies have revealed the existence in the State of fairly large reserves of ore of good grade. Many of the deposits are being worked, much prospecting preparatory to mining has been done, and new deposits have recently been discovered.

The deposits occur in a belt about 10 miles wide and 220 miles long, extending diagonally across eastern Tennessee from the Virginia State line at the north-east corner of the State south-westward to the Georgia State line near Cleveland, 20 miles east of Chattanooga. This belt follows the north-west foot of the Appalachian mountains, lying in the adjoining lowlands known as the Great Valley, or the Valley of East Tennessee, and in minor inter-montane valleys. It is traversed from north-east to south-west by the Tennessee river, which drains practically the whole of eastern Tennessee. Elizabethton, Johnson City, Newport, Morristown, Knoxville, Marysville, Sweetwater, Athens, and Cleveland, the largest towns within the manganese area, are served by the Bristol-Chattanooga line of the Southern Railway and its seven branches and by ten other smaller independent lines.

The manganese deposits are exposed at 119 mines and prospects, most of which were visited by the Survey's geologists, and are distributed through 16 counties, which, named in order, beginning at the north-east, are Johnson, Carter, Unicoi, Greene, Cocke, Hamblen, Grainger, Jefferson, Sevier, Knox, Anderson, Blount, Loudon, Monroe, McMinn, and Bradley.

Most of the ore is shipped to the Southern Manganese Corporation at Anniston, Alabama, and the Tennessee Coal, Iron & Railroad Co. at Birmingham, Alabama. Some, however, is shipped to the Carnegie Steel Co. at Pittsburgh, the Seaboard Steel & Manganese Co. at Temple, and the Miami Metals Co. at South Chicago.

Most manganese ore that contains over 35% metallic manganese is made into ferro-manganese, ferruginous manganese are that contains 10 to 35% of metallic manganese is made into spiegeleisen.

The available ore-reserves at the mines that were examined is estimated to be 85,000 tons, of which 75,000 tons is manganese ore and 10,000 tons is ferruginous manganese ore. These estimates are undoubtedly moderate or low, the reserves may be more than twice as great, possibly 200,000 tons.

TEXAS

Austin.—In the mandamus suit of C. D. Greene of Wichita Falls versus J. T. Robinson, State Land Commissioner, the former demands a permit to prospect for and acquire the oil and gas on 320 acres of land in Wilbarger county in the oil-field. The Commissioner is of the opinion that the State owns the minerals in this land, but the State Attorney-General having given him an opinion to the contrary he declined to issue the permit in order that a mandamus suit could be brought and the matter finally adjudicated by the Supreme Court. The application of Greene for a mineral permit was filed in 1915. At the term of Court last fall the arguments were submitted, and now all parties are anxiously awaiting a decision.

El Paso.—According to the 'Herald', S. H. Worrell, dean of the Texas School of Mines here, and chairman of the committee appointed by the mining circle of the University club, and the rest of the committee-men had their first meeting on the 12th to draft a new mining law to be submitted to the Texas Legislature. It was generally agreed to follow the general law of the United States, leaving out the feature regarding extra-lateral rights, as it is the cause of a great deal of litigation. It was stated by a member of the committee that it is probable that a provision will be made to pay the State a royalty on production, but it will be made free from ambiguity. The consensus of opinion of the members is that if it is finally determined to put in a royalty provision to make it on the net production, say, take the selling price of the product and then deduct all transportation charges at least. There is a disposition to leave out the United States provisions regarding tunnel-sites. This part of the laws is complex, and as the topography of Texas is different and the land laws different from the other States, it appears to be the opinion of the committee to leave this out and leave it for future action if found necessary.

UTAH

Alta.—The Woodlawn Mining Co., in the Little Cottonwood district, has opened 14 ft of high-grade lead-silver carbonate ore. W. J. Lawrence is manager.

Marysvale.—The Florence mill started again treating alunite for potash last week.

OKLAHOMA

Douthat.—The Tar Creek Mining Co., leasing south of this place, has two hand-jigs worked by one man. An unusual class of formation is being treated.

Hockerville.—The St. Louis Smelting & Refining Co. is erecting a hand-jig plant on a new lease on the Weiss land, south of here. A crusher and rolls will be part of the machinery.

Quapaw.—At the Gander mine 16 hand-jigs are to be installed by the Thelma Jane company, composed of O. A. Dunn and B. F. Routh of Tar River, and others. A carload of blende weekly is expected from these machines.

HAND-JIGGING PLANT IN JOPLIN DISTRICT, MISSOURI

WASHINGTON

Loon Lake.—The Loon Lake Copper Co. has started erecting a 100-ton flotation plant. Estimates give reserves amounting to 30,000 tons. W. L. Zeigler is in charge of construction.

Oroville.—Mining is said to be more active here than for some time. The Oroville Copper Co. is driving a tunnel on its vein, extracting good ore.—Arkins & Smith are erecting a 50-ton mill near Nighthawk to treat silver-lead ore.—The Copper World Extension is erecting an aerial tram.

CANADA

British Columbia

Princeton.—The Canada Copper Corporation has contracted with the Consolidated Mining & Smelting Co. at Trail to smelt its concentrate and refine its copper. Accommodation is being made here for 150 men by the Consolidated M. & S. Co. This work is understood to be preliminary to commencement of development of the property known as Voight's claims, which have been taken over by the company. This property adjoins that of the Canada Copper Corporation, near Princeton, on which extensive work has been under way for several years, and which will soon be ready for production on a large scale.

Quesnel.—About three years ago, gold was discovered by E. L. Armstrong on Proserpine mountain, just south of Barkerville. On his Independence claims Armstrong has since uncovered a 14-ft. orebody showing free gold. Sixteen samples taken by J. D. Galloway, government district engineer, averaged $61.50 per ton. On the Imperial claims, Tregillus, Carey, and others, nearby, uncovered this vein, where it was 9 ft. wide, with free gold. Assay from several points are reported to have yielded from $6.10 to $231.60 per ton. A 20-in. cross-vein, highly mineralized, was also opened. This assayed $16 gold and $8.30 silver. Sulphides appear at shallow depth.

Vancouver.—A statement of the gold deposited at the Dominion Assay Office here, shows that the year 1918 established a new record. The value of the bullion deposited was $4,080,185; in 1917 it was $3,257,221; and in 1916, $2,828,240. During the latter part of the season 189 assays of platinum-bearing ores and sands were made and 77 deposits of platinum metals received. The purchase of these metals has been discontinued, but assays of platinum-bearing material will be continued.

Ontario

Dividends paid by Ontario mines during 1918 are as under, according to 'The Daily Nugget' of Cobalt:

Cobalt:	
Nipissing, 25%	$1,500,000
Mining Corporation, 85½ cents per share	1,244,731
Kerr Lake, 20%	600,000
Coniagas, 12½%	500,000
Buffalo Mines (capital reduction)	250,000
Temiskaming, 3%	75,000
McKinley-Darragh, 12%	269,712
Penn-Canadian, 3%	40,491
La Rose, 2%	30,000
Total	$4,509,934
Porcupine:	
Hollinger Con., 5%	$1,230,000
McIntyre-Porcupine, 15%	541,542
Total	$1,771,542
Kirkland Lake:	
Lake Shore, 5%	$ 100,000
Grand total	$6,381,477

Cobalt.—Kerr Lake pays 25 cents per share, equal to $150,000, on March 15.

Cobalt.—The Coniagas company paid 2½% on February 1. This amounted to $100,000, and makes $9,340,000 to date.

Nipissing produced silver worth $254,118 during December, from 182 tons of high and 6700 tons of low-grade ores. The total for 1918 was $3,544,790, an increase of $155,322 over 1917.

Kirkland Lake.—The Lake Shore company distributed $100,000 during 1918. On December 10 the last dividend was $50,000.

Sudbury.—The Mond Nickel Co., which has mines and a smelter here, and a refinery at Swansea, Wales, will largely increase its output. It is offering a new stock issue of £1,520,000 to raise funds for extension of its refining works and provide for an increased volume of business, anticipating an expansion of 50%.

MEXICO

Chihuahua

Chihuahua.—Manganese mining in this district is practically at a standstill, owing to the absence of any market in the United States.

Santa Eulalia.—Villa has been active again in this part, raiding the town on January 22. He looted the safes and stores of the mining companies, hanging the mayor, capturing Federal soldiers, and telling the mine managers that they must increase wages and shorten the hours of labor.

Sonora

Cananea.—Greene-Cananea pays $1.50 per share on February 24. The previous quarterly rate was $2, during 1918, 1917, and 1916.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments The information is interesting to our readers.

Morton Webber is at Butte.

F. A. Beauchamp is visiting Sonora, California, this week.

Nicholas Treweek, of Salt Lake City, was in San Francisco last week.

Walter Broadbridge sailed for London from New York on January 22.

A. T. Thomson, P. G. Beckett, and **W. D. Hanbridge** were at Bisbee on January 18.

Courtenay De Kalb, associate editor of the M. & S. P., has returned to San Francisco.

Scott Turner has received his discharge from the Navy and is now at Lansing, Michigan.

C. E. Hoffman, manager for the Democrata Mining Co., at Cananea, was in Bisbee last week.

L. E. Porter, secretary and vice-president of the Tungsten Reef Mining Co., was in Bisbee last week.

Michael H. Loveman has opened an office at 32 Broadway, New York, for the practice of mining geology.

Isakichi Takenouchi, of the Sumitomo Beshi Copper mine, in Japan, is visiting the copper districts of Arizona.

V. H. Smith, of the Canada Copper Corporation, operating at Princeton, B. C., has been here on his wedding trip.

Frank H. Probert has been appointed member of a U. S. Government commission to study mining and metallurgical conditions in Europe.

T. C. Gorrie is general manager of the Old Eureka mine, at Sutter Creek, California, with **T. J. Donovan** as underground superintendent.

W. D. Thornton, Frederick Laist, William Wraith, W. N. Tanner, M. B. Gentry, A. G. Parsons, and **L. D. Ricketts** have been visiting Bisbee, Cananea, Ajo, and Miami.

Edwin Higgins has resigned as engineer to the California Metal Producers Association and is succeeded by **C. H. Fry**. Mr. Higgins has joined the staff of Bulkeley Wells in San Francisco.

Daniel Guggenheim has retired as president of the A. S. & R., and is succeeded by his younger brother **Simon Guggenheim**. **Edgar L. Newhouse** becomes chairman of the board of directors.

R. A. Conrads has resigned his position as metallurgical engineer for the Nevada Consolidated Copper Co. to take a position on the Federal Board for Vocational Education, with headquarters at Salt Lake City.

Obituary

E. M. Rabb, superintendent of the Ajax mine at Victor, Colorado, died from influenza at Tonopah, Nevada, on January 16.

T. J. Curran, well known in California and Mexico, died in San Francisco on January 15 from pneumonia following influenza. He was 55 years of age and was a native of Maryland. He was president of the American Magnesite Co. of Porterville, California.

The American Mining Congress and the American Zinc Institute formed local chapters at Joplin, Missouri, on January 28. **Victor Rakowsky** was chairman of the meeting.

At a joint meeting of the San Francisco branches of the national engineering societies last week the subject of 'Engineering Education' was discussed. The principal speakers were **J. W. Beckman, John A. Britton, C. L. Cory, C. D. Marx**, and **T. A. Rickard**. **James M. Hyde** led the discussion that followed.

THE METAL MARKET

METAL PRICES

San Francisco, January 28

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	22.00
Lead, pig, cents per pound	5.75— 6.75
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb.	$100
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	16.00

Aluminum-dust consumers will find a number of points of interest in 'The Inflammability of Aluminum-Dust,' by Alan Leighton, in Technical Paper 152 of the U. S. Bureau of Mines.

The War Trade Board announces that the restriction upon the importation of manganese ore or manganese di-oxide from Asia and Australia has been removed, and that licenses will now be issued, when the applications therefor are otherwise in order, for the importation of manganese ore or manganese di-oxide from any country.

EASTERN METAL MARKET

(By wire from New York)

January 28.—Copper is quiet. Lead is inactive. Spelter is weak.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.05 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, and on December 13 to 48 7/16 pence.

Apr.	46.37	72.51	95.35	Oct.	67.86	87.38	101.12
May	74.27	74.61	99.50	Nov.	71.60	85.97	101.12
June	65.04	76.44	99.50	Dec.	75.70	85.97	101.12

The Mint has not purchased any silver in the open market since July 1918. The price ($1 per oz.) of silver is likely to remain at that point for some time to come, as the Mint has power to purchase the same equivalent to the number of ounces resulting from the melting of silver dollars at that rate.

Weather conditions in India, which always influence the silver market, have been good. Silver coinage by the two Indian Mints has been on a large scale, as shown by the following output in August last, valued at 55,270,290 rupees ($17,089,373):

Whole rupees (silver)	51,500,024
Half rupees (silver)	993,660
Quarter rupees (silver)	1,132,488
Two-anna (nickel)	957,112
One-anna (nickel)	619,000
Single pice (bronze)	47,000
Pie pieces (bronze)	29,000

As the average speed of coining is estimated at 2600 coins a minute in Calcutta and at 1600 in Bombay, the velocity of the output per second equals 70 coins, worth an average of 46 rupees ($14.70).

A reduction in the size of 50-sen, 20-sen, and 10-sen silver coins has been announced by a Japanese ordinance, the reason being, not only that the silver coins in use at present are rather inconvenient to carry, but because of the practice of melting them into bullion on account of the appreciation in the market price of silver. The new silver coins will be smaller in size by about 1/100 of an inch than the preceding coins, and will contain a smaller quantity of silver. The Government intends to mint Y20,000,000 ($10,000,000) in the three denominations during the current fiscal year, and gradually to withdraw the old coins from circulation.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71½c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

Eastern Metal Market

New York, January 21.

Prices have a downward tendency, with copper selling at 20c. or lower and all markets inactive. No business of any importance is being done in tin. The price of lead has been reduced ½c. per lb. by the leading interests (A. S. & R. Co.) Prices of spelter are weak as a result of over-production.

ALUMINUM

Dealers are offering virgin metal at 32c. per lb. and it is not at all unlikely that this price could be shaded. The Government price, which will continue in force until March 1, is 33c. per lb. for 50-ton lots, 33.10c. for 15 to 50-ton lots, and 33.20c. for smaller quantities.

ANTIMONY

Antimony is weaker, and 5-ton or larger lots can be bought at 7.50 to 7.75c. per lb. The prices for smaller lots are higher, the quotations being 8.25 to 8.50c. On last Monday a 50-ton lot of Chinese antimony was sold on the New York Metal Exchange. The price paid was 5.95c. in bond, equivalent to approximately 7c. per lb., duty paid.

COPPER

The copper market is noticeably easy, and the sales that have been made during the past week were at prices ranging from 20c. per lb. downward. In fact, it is not at all unlikely that business can be done at 19 or 19.50c. While copper producers are still quoting the 23c. price, it is considered doubtful if much business is being placed on that basis, in spite of the fact that consumers will be protected by the producers against their own price declines. The point has been raised as to how long producers will maintain the higher quotation, especially as there is barely enough business to keep the people busy who are willing to sell at 19.50 or 20c. Cabled reports from England stating that there is 36,000 tons of copper in that country had a markedly depressing tendency upon the New York market, it being considered not likely that there would be any demand from England for some time to come. It is also believed that there is a large supply of this metal in France, bought for war purposes but not used. The demand for copper in the first two weeks of this year was fairly good. About 10,000,000 to 20,000,000 lb. changed hands in that time, but the market then relaxed into extreme dullness. This prevailed until last Monday, when some renewed interest in February shipments was observed.

LEAD

Dullness and quiet characterize the lead market which is decidedly easier. The output is being curtailed by the producers to stabilize the situation. On Tuesday the American Smelting & Refining Co. reduced its price from 6 to 5.50c., New York, and in the outside market 5.37½ to 5.50c. is being quoted. In spite of this, little business is being done.

TIN

Tin is still quoted at 71.50c. per lb., New York, which is the same as last week. The market is dull. An effort is being made by the Tin Section of the War Trade Board to sell the allotment of tin bought for this country, but consumers cannot see why they should pay 72.50c. per lb. when the metal can be imported for about 20c. per lb. less. They consider that the Government should take this tin as a war measure, and sell it at the present market value, accepting the loss as part of the fortunes of war. It is probable that many of the consumers will take the tin from the Government, although they do not regard its plan favorably, as they consider it their patriotic duty to do so. The London quotation for spot Straits today was £250

ZINC

Spelter production is noticeably in excess of demand, and the market is weak. Prime Western is being quoted at 6.75 to 6.82½c., New York, and at St. Louis the quotation for high-grade spelter is approximately 8.50c. For the week ended January 11, production increased 380 tons and stocks increased 2684 tons, according to the Government's report.

COPPER NOTES

A conference between employees of copper companies of Utah, Montana, and Arizona and the Department of Labor, to discuss the present labor situation, was called by the Secretary of Labor for January 31 at Washington. The formal announcement reads:

"In view of the curtailment of the copper output following the signing of the armistice and the consequent reduction of the working forces, the Secretary of Labor has invited the grievance committee of the employees of all the copper companies operating in Arizona and representatives of labor in Utah and Montana to send delegates here to confer with him Friday next to co-operate in obtaining the best possible working conditions during the readjustment period."

Twenty of the principal copper producers of North and South America yielded a total of 1,763,668,637 lb. during 1918, an increase of nearly 90,000,000 lb. when compared with the previous year; but during 1917 there were many labor troubles in the United States, resulting in shut-downs. Since last December there has been a general curtailment of operations ranging from 25 to 50% of capacity. The much expected demand for copper from Europe has not materialized, there being large stocks in England, France, and Italy. Exports during 1918 were as under:

Month	Pounds	Month	Pounds
January	81,058,000	August	42,300,000
February	56,324,000	September	71,220,000
March	62,376,000	October	22,400,000
April	47,622,000	November	18,000,000
May	61,586,000	December	11,000,000
June	63,582,000		
July	64,573,000	Total	602,041,000

According to Daniel Guggenheim, retiring president of the A. S. & R. Co., the finances of this company are in excellent condition: "As to the immediate future," he said, "because of problems of reconstruction confronting the whole world, some difficult months may be expected; but I am a great optimist as to the future, based upon the enormous demand that must be made for raw materials. These demands will be felt as soon as the various business interests realize that prices and supplies are at a low ebb. For many years, the senior members of Guggenheim brothers have been the dominant factors in affairs of A. S. & R. Co. and American S. S. Co. They feel that, if these companies are to retain and improve their business positions, it is advisable to turn over the management and control to younger and more aggressive men. It has been decided that three of the older members of Guggenheim Brothers should retire, so that the important offices of president, chairman of executive committee, and chairman of finance committee may be filled by others. Those succeeding to our positions are contemplating putting into effect many excellent plans, which will be of prime importance, and which will, I believe, ensure their signal success in directing affairs of the companies. During the years of my presidency, many important reforms in the business have been inaugurated, and none more important, in my judgment, than permitting its important managing and operating officials and employees a participation in profits of the companies. . . ."

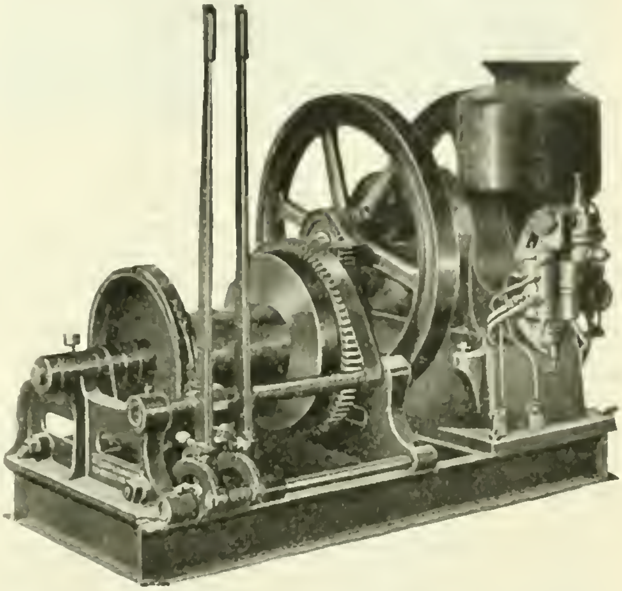
INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

RE-BUILDING USED MACHINERY

The purchase, overhaul, and re-sale of used machinery of all descriptions is a specialty of Buttress & McClellan of 205 N. Los Angeles St., Los Angeles, California. The business has expanded to the present large ground-floor store and upper floors, a shop completely equipped for the re-building and overhauling of used machinery; also two warehouses where equipment is stocked for sale.

Following the course of a piece of machinery as it goes through the shop, we find the procedure to be: Supposing an engine or compressor is purchased in the field: When it enters the shop it is immersed in a bath of lye; a specially-constructed vat has been provided for this purpose, and it will take anything intact up to a fair size piece. All grease, dirt, and even what is left of the original paint is cleaned off in this way. This makes possible a thorough inspection. The engine is then dismantled, the different parts going to various departments in the shop fitted to do any special work necessary. When this is completed, the engine is re-assembled, thoroughly tested, re-painted, and ready to go out, backed by the firm's guarantee. The same is true of other equipment purchased and re-sold by them. Mine managers and those purchasing for mines are invited to inspect their shop when in Los Angeles. The firm is also building several types of new machines in its shops. Among these is the small hoist illustrated. They also manufacture an impact screen. A competent engineering staff is maintained ready to advise concerning the erection of any equipment sold. Many complete mine and mill plants have been built under their direction. Many problems have been worked out. During 1918, when new equipment was at a premium and deliveries were uncertain, Buttress & McClellan filled many orders with judgment and dispatch.



A HOIST FOR SMALL MINE

This firm is also in the market for used machinery. Anyone about to dismantle plant would do well to communicate with them.

INTERIOR VIEW OF WAREHOUSE, SHOWING MACHINERY READY FOR SHIPMENT

REMOVING A PECULIAR OVERBURDEN FROM IRON ORE

Stripping overburden on the iron ranges of Lake Superior frequently is handicapped by the presence of a vegetal matter known as muskeg. When dry, this material burns like peat, and when wet, runs like mercury. The latter characteristic is being taken advantage of on the Gogebic range in northern Michigan. Muskeg is prevalent near the Plymouth mine at Verona. One dump has been set aside for handling this material exclusively. A stream of water plays upon the dump continually, pumped from a near-by water-hole, as shown in the illustration. The result is that when the stripping train arrives and discharges its load of muskeg, the wet material on the dump slips out under the weight and flows down the slope into the field below. Using this method, cars can be dumped at the same spot for two or three weeks without shifting the track.

SHOWING HOW MUSKEG DUMPS SLIDE

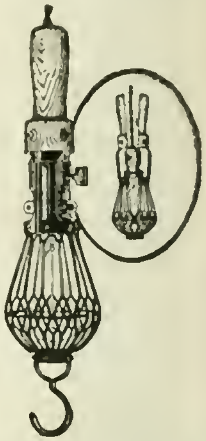
The equipment used for stripping the 85 ft. of overburden consists of a 225-B Bucyrus shovel, with 6-yard dipper, loading into Western 20-yard automatic compression-lock air-dump cars. These cars were developed on the Mesabi range for handling the heavy overburden at the U. S. Steel Corporation's properties. A stripping average of 125 20-yd. cars in a 10-hour shift has been maintained, and a maximum of 204 cars in the day shift has been reached. On the Cuyuna range, 100 miles west of Duluth, Minnesota, there is a layer of muskeg at the surface that has been burning for a number of years. The smoldering fire leaves a hot ash, which has the appearance of solid ground. Since a workman sank into it up to his hips in trying to make a short-cut, the men keep to the beaten paths. Last August the Gordon Mining Co. at Crosby began stripping the Portsmouth mine, one of the Coates & Tweed properties. The ground had the appearance of a smoldering volcano, with puffs of smoke arising in all directions. Using an equipment, consisting of a Bucyrus 85 shovel, with 5-yard dipper, loading into Western 12-yard air-dump cars, the company succeeded in clearing most of its 40 acres of muskeg before the freeze-up. The remainder of the overburden, being of a sandy nature, can be handled easily in winter.

SHOVEL FILLING DUMP-CARS AT A HIGH LEVEL

Cuyuna is the youngest developed of the Lake Superior iron ranges. There are 34 mines in operation on the range, most of them underground, although there are several open pits. Cuyuna ore has attracted much attention on account of its manganese content. There is 75 ft. of overburden to be taken off, in case of steam-shovel operation. Ordinarily, steam-shovels and Western dump-cars are used in stripping, but the John A. Savage Co. is to try hydraulicking.

PORTABLE-LAMP GUARDS

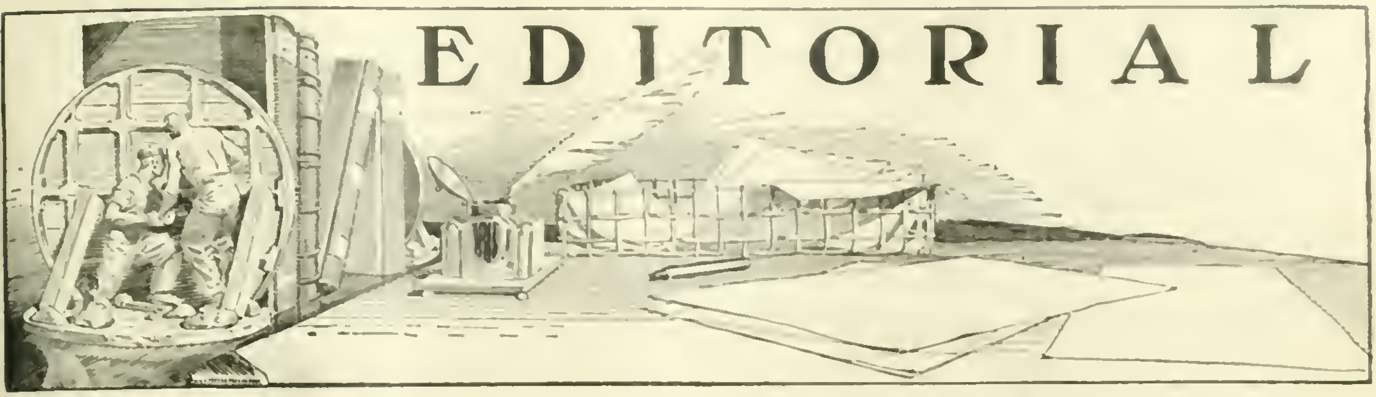
A new departure in portable-lamp guards is shown in the illustration of the Flexco split-handle, which can be quickly attached to the well-known Flexco expanded-steel lamp-guards made by the Flexible Steel Lacing Co. of Chicago. This portable successfully fills a demand for a substantial handle guard which does not need to be wired. The halves of the guard, including the handle itself, open wide from the hinge at the bottom of the guard, and can be closed instantly and locked around the socket at the end of any extension cord. The cord runs through grooves in the handle. The convenience of this new product will be appreciated in factories, mills, or warehouses, and by the motorist in his garage, because it permits light to be safely carried to dark corners. Danger from fire is avoided, and lamp users will readily see the advantage and economy, as the modest cost of the guard is soon repaid through prevention of breakage.



CARBON AND COMMUTATOR WEAR

According to R. E. Hellmund, of the Westenghouse Electric & Mfg. Co., carbon manufacturers, as well as makers of dynamos, have made numerous tests to determine contact resistances, friction losses, etc., of various carbons. While such tests are of interest, they contribute little toward the real practical need; namely, a carbon that can stand high-current densities and high-sparking voltages with small wear. In order to develop such carbons, it would seem essential to first make tests determining how the carbon wear is affected by current density, sparking voltage, and peripheral speed. Present indications are that with many commercial carbons appreciable densities can be used if there is no sparking voltage, while such up to 15 or even 20 volts across the brush cause little wear at certain speeds, if the current density is low enough.

The General Briquetting Co., 25 Broad street, New York, is erecting new demonstration and custom briquetting plant at 57th street and 12th avenue. Provisions have been made to demonstrate on a commercial scale modern methods of briquetting ores and concentrates of all kinds, as well as metal, coal, lignite, and flue-dust. The installation includes a type FE rotary 12-mold toggle-press; a type A 325-ton hydraulic-metal briquetting-press, adaptable to various kinds of metal scrap; Belgian roll coal-briquetting machinery; masticators, annealing ovens, dryers, elevator and conveyor system, and power-plant. It will commence operations about February 1, 1919, having cost $200,000. H. K. Schoch, chemist, late of the National Bureau of Standards, at Washington, and George R. Cowan, briquetting engineer, late of Ellington Field, Texas, have resumed their positions with the General Briquetting Company.



OUR friends the silver miners will be pleased with the statistics of exportation as given by the Department of Commerce. During 1918 the exports of silver amounted to $253,000,000 as compared with $84,000,000 in 1917. During last year the imports were small, only $71,000,000, as compared with $53,000,000 the year before.

UPON December 18 the medical correspondent of the London 'Times' estimated that 6,000,000 had died from influenza and its sequelæ in the preceding 12 weeks; if that be so, it is safe to estimate that fully 10,000,000 have succumbed to the epidemic by this time. India alone was credited with 3,000,000 deaths nearly two months ago.

HEARST is publishing a series of letters by Shaw. It is in Hearst's papers that one would expect to see Shaw's meanly insinuating, subtly corrosive, lucubrations. We know George Bernard Shaw. He is a blue-faced baboon with his fingers to his nose, making faces at all that is of good report, all that is worth while. He is a disintegrating factor in modern life and it is fitting that his sneering affectations should be printed by the bubonic rat of American journalism.

KEEN satisfaction will be felt by those interested in the oil industry of California at the agreement by the conference of the House and Senate to pass the Oil-Leasing Bill, which will go far to settle a long and bitter controversy. The Bill provides that persons holding claims on the Naval Reserves may lease the land from the Government on payment of one-eighth royalty, but no new wells may be drilled; on the other hand, it will permit development work to be resumed on existing wells on the Naval Reserves and will encourage extensive exploration in disputed oilfields outside the Reserves.

WHAT systematic and persistent propaganda can accomplish has been proved by the success of the prohibition policy and also by the German effort to influence and mislead public opinion in this and in other countries. The one propaganda has achieved its purpose; the other is still insidiously at work. If the vintners and the temperate users of wine as a wholesome beverage had not left the saloon-keepers to oppose the intemperate policy of prohibition the result would have been far different. We might have agreed to close the saloons and check the debauchery of the young by alcoholism without foregoing the sane use of one of Nature's best gifts. If we leave the defence against German propaganda merely to the opponents of Hearst and Shaw, we shall invite a like regrettable consequence.

CHAIRMAN GARY of the United States Steel Corporation strikes no uncertain note. At a time when hesitation and timidity characterize the general attitude of business men, it is pleasant to read his confident assertion that this country is "in an era of prosperity undreamed of." "What we need to do," he says, "is simply to get to work and not talk about unemployment. Psychology has a good deal to do with it. Pessimistic talk will do more to bring about unemployment than it will do to prevent it. This season of the year is always clean-up time. As for the steel industry, we are not thinking of any depression." These are brave words.

AMERICAN rights in Mexico have been made the subject of a national association that includes representatives of a number of industrial enterprises. The personnel of the executive committee of this National Association for Protection of American Rights in Mexico has not been disclosed, but Mr. E. L. Doheny is one of them and he has been deputed to go to Paris in order to present the legitimate grievances of American business-men operating in Mexico before the Peace Conference. It is estimated that $2,500,000,000 of foreign capital is invested in Mexico; of this $1,000,000,000 is American money, $700,000,000 is English, $500,000,000 is French, and $300,000,000 is Canadian. As the 'Boston News Bureau' suggests, if bolshevism in Eastern Europe is to engage the attention of the Conference at Paris, why not the bolshevism in Mexico? Is Lenine to be censured and Carranza to be immune? Hence another judgment of Paris. Who is to play the part of Venus?

ANACONDA is never behindhand in public-spirited action. We note with pleasure that the Anaconda Copper Mining Company—to give the full name of this great enterprise—has cancelled the lease given on the Florence hotel at Butte and has transferred the building, which has accommodation for 500, to the use of returned soldiers and sailors lacking a home and unable to support themselves until employment is forthcoming. Everything is to be free, and this includes a gymnasium, a poolroom, and a library. The company supplies all the attendance and restores the S in the word hotel, making it a real guest-house. This gift represents $15,000 per month, but it is worth much more than that in good-will and in the example it sets.

MANY of our readers are aware that the proposed merger of the Mining and Metallurgical Society with the Institute was not put into effect, owing to a difference of opinion that developed at the last moment. The delay has been fortunate on two counts: in the first place, the president, Mr. Walter R. Ingalls, was enabled to deliver a timely and interesting presidential address, a portion of which we take pleasure in reproducing on another page. Secondly, the Society has been enabled, with dignity, to award its annual gold medal to Mr. P. H. Schneider of the Creusot steel works, the plant responsible for making and improving the celebrated 75-millimetre gun. The medal was transmitted through Mr. E. Gybbon Spilsbury, who is in France. Speaking of the Society, we are in receipt of a letter from Messrs. C. R. Corning and George C. Stone correcting the statement we made regarding the removal of the constitutional provision against the participation of the Institute in public affairs and emphasizing the fact that the Society would lose its freedom in this respect if it were to be merged with the older organization. We mention this because the letter from our friends in New York arrived too late for publication in this issue. It will appear next week.

RAILROAD freight-rates differ from any other kind of rates in one important particular, namely, they have no bearing on the cost of the service. In this issue Mr. N. H. Emmons 2nd suggests a rate-making scheme that defies all precedent in that the cost of the service is taken into consideration. If any dyed-in-the-wool trafficman should read this article he will pour the vials of his wrath on the head of our author, for the railroad people resent furiously any curiosity, however innocent, on the part of the mere layman, into the mysteries of rate-fixing. From the famous truism "all the traffic will bear", attributed to the late Collis P. Huntington, to the motto "the public be damned", enunciated by William H. Vanderbilt, there have been evolved various hypotheses according to which freight-rates, by laborious economic evolution, have been developed to a complexity that would lead even a twin-six expert into a maze of confusion and contradiction if subjected to skilful cross-examination. The railroad-builder was one of our pioneers. He built miles of steel highways into the waste places of this continent, he risked the chance of being repaid by the communities that were to benefit by the improved transportation he brought to them or created in advance of them. If the luck was with him, he, like the dog, had his day and gathered the shekels with one hand while using the other to ward off the federal commissions, chambers of commerce, and merchants' associations that threatened to interfere with his prosperity. The one rule that established the rate was the cost of whatever competitive service was available. What the outcome of the present Government control will be, nobody knows. For ourselves, judging from a limited experience, we would rather take our chance under normal competition, despite all its self-evident sins, than be in the hands of a paternal department at Washington.

PRODUCERS of zinc ore, especially those in the Tri-State region of Kansas, Missouri, and Oklahoma, also the New Jersey Zinc Co., have been urging the greater use of spelter and have been investigating how consumption of the metal could be increased. With interest we learn that the New Jersey Zinc Company, pressed for room in its quarters in the National City Bank on Wall street, has moved into its new seven-story building on Front street. Zinc has been used here in many ways, on the exterior and interior, including flashings, gutters, and all other outside work, all of which are made of rolled zinc, instead of copper. The doors of the vestibule are of zinc sheets rolled on wood. The knobs and locks are of zinc-plate throughout the building. The hinges are made of zinc alloy. The inside walls of the elevators and doors are of this material, and all the window-fittings are manufactured from zinc-plate. Interior fixtures, trimmings, and fittings are of zinc materials. All low-tension work in the electric equipment and lighting fixtures are of zinc-plate; and the frames for the illuminating lamps are spun from rolled zinc-sheets. Ornaments throughout the building are cast from zinc. Paints, enamels, and tints that compose the interior decorations include zinc oxide and lithopone. Thus the New Jersey Zinc Company furnishes an object lesson for its propaganda on the larger use of spelter.

THE attraction of Mexico, like 'the call of the wild', is one to which every mining engineer surrenders if once he has lived in the southern land. Hence we are asked at intervals whether conditions in Mexico are improving and whether it is safe to return thither. To that we would reply that such information as comes to us indicates that the Carranza government is settling in the saddle and is steadily establishing its ascendancy, owing, in part, as was to be expected, to the lavish use of graft. For example, the Mexican army boasts some 300 generals, who, thanks to their pay and their gorgeous uniform, have been won to the support of the de facto government. Mining is taxed 10% on the gross output, but the cheapness of labor and the high price of silver mitigate the affliction. At El Oro, Pachuca, and other old centres of activity the unsettled state of the country does not hinder operations, partly because the Government needs the metals produced and the revenue derived from the English and American companies. On the West Coast there is increased activity and also news of highly satisfactory developments underground. On the East Coast the oil companies are paying tribute to Pelaez, but that does not excuse them from being mulcted by Carranza. In due course we may hope that President Wilson, having aided so usefully in arranging European affairs, will join with his friends at Versailles in cleaning up things in Mexico. Americans in that country are entitled to protection. Of course, we are aware of the Administration's policy of washing its hands free of responsibilty for our nationals in Mexico, but that is a doctrine not yet accepted by the people, and least of all by the mining community. During the War the Government has not scrupled to collect income-tax from Americans in Mexico, nor has it hesitated to call upon them to give military service. It is a poor rule that does not work both ways. If it be the duty of an American resident in a foreign country to pay taxes to his home government and to enlist in his country's military forces in time of war, then, it seems to us, any reasonable notion of reciprocity or fair play requires his government to protect him in the exercise of legitimate industry wherever he may be, at home or abroad.

The Relief Bill

Our attention has been called to an editorial in the issue of the 'Engineering and Mining Journal' of January 18 on 'Aid for War-Minerals Producers'. We had not noticed it, but several of our friends in the West express keen irritation against the sneering attitude assumed by our contemporary toward the producers of chrome, manganese, and tungsten because they ask to be compensated for loss caused by reason of their effort to comply with the urgent requests of representatives of the Government who made an insistent demand for sundry secondary minerals essential to the successful waging of the War. Our own views on the controversy have been expressed frankly and frequently; we think that the chrome producers, for example, are entitled to redress, and we gave the services of Mr. Courtenay De Kalb in an effort to induce some measure of relief at Washington. The result is a bill introduced by Senator Henderson on December 15, as duly chronicled in our issue of January 4. Since then Senator Henderson, after conferring with the Secretary of the Interior, has re-introduced his bill as an amendment to the Dent-Chamberlain bill. In order to restrict the application of relief to the genuine sufferers a clause has been inserted limiting liability to claims filed "on or before three months from and after the approval of this act," and the recipients of the relief are described as those exploiting minerals "the production of which was in pursuance of a request or demand of the War Industries Board, the Shipping Board, the Department of the Interior, or other authorized agency of the Government." On January 30 the amendment was passed, with the Dent-Chamberlain bill for validating war contracts, but it was altered so as to apply only to those that received personal requests for production. We hope that this latest proviso will be deleted because it seems picayune. A Government does not make requests in person when it is in need of material, it uses its agencies of publicity, and whether the request comes direct from one of its agents or is made effective by a circular or other duly authorized printed statement makes no difference, if it be the intention to deal honorably by those that complied with its solicitations. We expect, therefore, that this restrictive proviso will be omitted when the Bill goes into conference of the two houses of Congress, so that a public wrong may be righted without more delay. The gentleman in New York thinks otherwise. He says the amendment ought to be worded as follows: "A bill to create endless work for the Interior Department, and a cemetery for the blasted hopes of those who, at one time, classed themselves as patriots." That is not even clever; it is merely insulting, and will be so regarded by a large number of worthy men, who were not seeking any dollar-halo but did use their experience, time, and money to produce the minerals for which the agents of the Government, in circulars and in letters, were clamoring. The gentleman in New York uses the pontifical "we" in order to identify himself with the very persons he is so reckless in maligning. "We are not harder hit than thousands who are not miners." "We went after chrome and manganese ores because the prices for these ores were high and we believed that we could get in and make money." "We were certainly led to believe, etc. etc." *ad nauseam*. What warrant, may we ask, has the editor in New York for identifying himself with the Western miners of chrome and manganese? His sense of humor must be curiously awry if he supposes that those whom he ridicules will appreciate this attempt to identify himself with them. He says that "not one good American but would say that he was glad to see it [the War] stop the day it did," thereby intimating that the producers of chrome and manganese might have wished the War to continue in the hope of profiting from the sale of their products. It would have been much better if the gentleman in New York had foreborne to lecture and to ridicule; and if instead he had made an inquiry into the reasons underlying the misinformation of the agents of the Government; and if he had directed some of his jaundiced sarcasm at the real profiteers, at those that controlled the consumption of chrome and manganese in this country and succeeded in bamboozling both the War Industries and Shipping boards.

American Mining Congress

In this issue we publish a considerable part of the address delivered recently by Mr. J. F. Callbreath, the Secretary of the Mining Congress. Mr. Callbreath is the key-man of that organization and its principal spokesman; therefore anything he says in public is sure to interest our readers. We are glad to give publicity to his remarks because we consider that every mine-operator and manager of a mining company should join the Mining Congress, which is an organization dedicated to the protection and furtherance of the political interests of the mining industry of the United States. Mr. Callbreath reviews the history of the organization and shows how much it has accomplished already by influencing good legislation and by opposing that which might prove injurious. He says, frankly, it has "mining politics" for its special business. He insists, rightly, that every good citizen must be a politician, that is, he must show an intelligent interest in the government of his country and in the laws enacted by his representatives at Washington. The mining industry—likewise the mining profession—has suffered by too much detachment from political matters, leaving such vital business to men it took but little interest in electing and still less interest in advising and checking. With all this we are in entire accord; and believing as we do that the American Mining Congress has a distinctly useful function to perform we venture again to criticise the proposal to expand its activities in a wrong direction. We refer to the proposal to establish eight divisions for the collection of statistics and technical data concerning the various branches of mining and metallurgical work. Each division is to be headed by a thoroughly competent man. In the first place, that will involve a large expense, for competent men are not cheap. Next, the proposed scheme will traverse the ground now covered by the U. S. Bureau of Mines and the Geological Survey, whose energies already are in danger of wastage by reason of duplication of effort. This duplication is a manifest blunder. For example, when information was needed by the Government on the question of an adequate supply of mercury, for war purposes, an inquiry was made in triplicate, by Mr. Hennen Jennings for the Bureau of Mines, by Mr. F. L. Ransome for the Survey, and by Mr. William Forstner for the War Industries Board, besides the investigation made by the State Mineralogist of California. Similar overlappings involving waste of time, money, and service, marked the campaign organized at Washington to stimulate the production of chrome and manganese. There should be no excuse for repeating such mistakes. If Mr. Callbreath or any other director of the American Mining Congress is in want of trustworthy data on any phase of mining or metallurgy, and if they cannot obtain such information from the existing Federal bureaus, then the latter are failing to justify their expensive existence; and of such delinquency there is no evidence whatever. Therefore we hope that, rather than start another costly organization for collecting information, the Mining Congress will make use of the offices already available and that it will co-operate with them in the friendly manner that has always characterized its relations with both the U. S. Bureau of Mines and the Geological Survey.

Emigration After the War

Doubts are being expressed as to the trend of popular migration after the War, which we must remember is not yet ended, and until it is finished by the signing of peace the conditions of normal international communication will not be restored. Mr. Frederic C. Howe, who has recently returned from Europe, where he studied the subject of emigration from his vantage point of Commissioner of Immigration at the port of New York, says that an emigration of large volume from this country to Europe will ensue as soon as the barriers to travel are removed. These departing guests will be prompted by diverse motives: some of them just want to go home, others are dissatisfied with the menial position they occupy in the American community, others again are anxious to take part in the political changes now in progress in their native land; many feel that they must go in order to ascertain what has happened to their relatives; a few seek inheritances left to them by the decease of those victimized by the War; others are attracted by the prospect of acquiring the land released by revolution, and so forth. It is said that immigrants from neutral countries, such as Holland and Scandinavia, resent the rough treatment to which they have been, in their opinion, subjected in this country during the War. The agents of steamship companies report that during the past four years 1,250,000 applied for passage home; they estimate that now twice as many are awaiting the chance to leave. It looks as if we were to lose a large number of European sojourners. Italy is prosperous and organized industrially as never before; she is in a position to welcome her sons home and promise them good pay. The breakdown of the autocracies of Central Europe has created opportunities that will attract many from here. The American Jew may shy at the chances offered in the new Zion of rehabilitated Palestine, but the poorer Jews of Russia and Germany may go thither, making so much more room for American repatriates. Apparently the legislation already introduced in Congress to prohibit immigration for four years following the signing of the treaty of peace is based on wrong information. It is said that one of the purposes of the proposed embargo is to exclude Bolshevists and other anarchists. Unfortunately these enemies to society are not labeled or readily recognized; they arrive not uncommonly in the guise of suckling lambs, and it is only after they are domiciled with us that they assume their real character of political wolves. The first thing to do is to deport any of them that are not already protected by naturalization. The representatives of organized Labor are said to be urging the bill now before Congress. On the other hand, representative workers in Europe object to the erection of any such barriers to the movements of the laboring populations. One would imagine off-hand that the spirit of democracy now aroused in Europe would resent any restriction on the citizen's choice of a place to work or to live, and we see in this difference of opinion one of the many obstacles to the international solidarity of the working class. This is not to be regretted, for an alignment of citizens on the basis of class would stultify the basic principle of democracy and give us an internationalism of labor based on the predatory ideas of bolshevism instead of the ideals for which President Wilson, for example, is striving at Versailles. One consolation we may take to ourselves: if there should be an emigration to Europe on the part of the alien folk in this country, it would consist mostly of un-Americanized foreigners, of those that have failed to assimilate. The result would be a shortage of labor, perhaps, but a strengthening and a purifying of the national spirit.

DISCUSSION

Leasehold v. Fee-Simple Tenure for Mineral Land

The Editor:

Sir—Although I find much to approve in the editorial entitled 'Mining Law' in your issue of October 5, 1918, I feel obliged to dissent from its approval of Van Wagenen's preference for fee-simple titles on the ground of democracy. The German autocracy under the astute guidance of Prince Bismarck in the 'eighties adopted many measures to improve the economic well-being of the masses, such as compulsory education, state insurance, and factory legislation for hours, wages, and sanitation. These measures were largely copied from the experience of England, which had found them necessary to restrain the national degeneration caused by the unregulated adoption of the machine-factory system in the later 18th century. While the purpose of Bismarck was to steal the Socialists' thunder and meanwhile develop brighter and stronger soldiers for the Kaiser, that does not make his social legislation undemocratic, for anything tending to sharpen the wits and improve the physique of the masses must ultimately tend to increase their influence in the State as the present German revolution demonstrates.

Similarly, the fact that Germany leases her mineral lands and operates her publicly-owned railroads does not denote that either practice is, *per se*, autocratic; for otherwise Australia would be the most undemocratic of the British dominions since she owns her railways and every State, except Queensland, leases her mineral lands.[1] The State ownership of mines and public utilities cannot be oppressive to Demos provided that Demos controls the State. Bureaucracies, being merely creatures of the government, are equally as harmless for individualism wherever the people own the government.

My observation of the fee-simple system for mineral land in the United States and Canada, and of the leasehold system in Latin America, has convinced me that the latter system is much easier to control in the public interest, either from the standpoint of an equitable division of mineral wealth, or from that of equality of opportunity for the individual to acquire mining property or development.

If one holds the democratic theory that every citizen has equal rights, it is evident that this means not only political rights but economic rights: in other words, as the chief economic possession of a modern nation is its territory, every citizen should enjoy an equal share in its natural resources. This does not mean a share of *gross* output but of the residual output—called 'land rent', 'mineral royalty', etc.—remaining after the necessary living wages for the labor and capital expended in production have been expended. For urban, agricultural, and pastoral lands the land rent can be garnered equitably by land-value taxation, as shown by Shearman[2], assessed against either the rent or the selling-value (capitalized rent). Although many classes of mineral land—such as those of petroleum and the non-ferrous metals—cannot usually be evaluated until developed for production, the public's share in their exploitation can still be obtained by assessing the royalty-value of their output, as I have elsewhere eexplained in detail.[3] Still, none of our States now collect from our developed—and still less from our undeveloped—richer mineral lands anything like the taxes which the above democratic criterion would require. And they are not as liable to do so under fee-simple as under leasehold, simply because the former system tends to mask the special nature of landed possessions, which cannot, like true capital (labor products) be ever considered in a consistent democracy as absolute private property.[4]

To attain and maintain my second criterion—equality of opportunity for development—the leasehold system's superiority to fee-simple is noteworthy. The ideal condition for the prospective miner is to find all mineral land in the public domain and freely open to exploration except those areas either under exploitation or to be exploited within this generation. To secure this ideal, the possession of mineral land by speculators, who will wait indefinitely to get rich without mining, or by monopolists, who will idly bestride a whole mineral range to keep out competitors, must be prevented.

Unfortunately, the fee-simple tenure of our Eastern States has encouraged both speculation and monopoly on a vast scale. A new district is hardly found when it is covered by paper titles, as witness the Mesabi iron range and the Connellsville coke-field, in the 'nineties, and the coalfields of West Virginia and the South within the present century, without mentioning the anthracite lands of Pennsylvania and the copper and iron ranges of Michigan which were cornered by the last generation. The West, outside California, was hardly feasible for mining until the completion of the Union Pacific railway in 1869, yet where is the metallic mineral district that is not plastered with locations in every direction, whose owners will do everything but dig? Where these locations have been patented they have fee-simple titles that imply no further obligation than the payment of State taxes, which are absurdly low in the case of undeveloped land; where they are 'claims' under the Federal law of 1872 they imply obligatory development at the rate of $100 per 20 acres annually, yet, owing to the mere local inspection this obligation can be, and often is, evaded by perjury. Had it not been for the conservation measures, which, a decade ago, stopped further sequestering of the Federal coal, oil, and phosphate lands of the West, it is probable that these too would have long ago followed their Eastern counterparts into the hands of speculators and monopolists.

[3] 'Natural Taxation of Mineral Land', 'M. & S. P.', Oct. 29, 1915.

[4] 'Progress and Poverty', by Henry George, Book II.

Under the Diaz law of 1892, which abolished the ancient obligatory development and allowed large mineral areas to be held simply by paying an areal tax of ₱3 per hectare (60 cents per acre) annually, the leasehold system of Mexico became as favorable for speculators as our fee-simple tenure, and by 1910 every likely district was covered with idle locations. Under the new policy of Carranza conditions have improved for the working prospector, because under an annual areal tax varying from ₱6 per hectare, for areas of under 5 hectares, up to ₱18 for areas exceeding 100 hectares, coupled with the obligation of mining activity, large numbers of idle holdings are rapidly reverting to the public domain. Had the paper-money plague and the continual civil war not disorganized finance and transporation, the new legislation would undobutedly stimulate an unprecedented mining development in this country.

It is important for the individual that he be protected against avoidable accidents and diseases when engaged in mining and for that reason all civilized states attempt to control underground operations in these items by public inspectors. It is evidently easier to incorporate the proper standards for mine operations in leasing contracts than to proceed against recalcitrant mine-owners in the courts, a method inevitable with fee-simple tenure. Under the latter system, too, a mine-owner has the right to exclude from his property even the Federal scientist studying geology for the public benefit, and this right has been exercised for many years in the case of a great mine in the South-West.

Mines are akin to public utilities, like railways, in that they would often be benefitted by having the right of eminent domain to acquire extensive stretches of adjacent surface-rights for reduction works, tramways, pipe-lines, etc. In countries handling mineral deposits, under the Napoleonic code, as subsoil property distinct from the surface, it is easy to grant mine-lessees the right of condemnation for surface needs. By such leaseholds, too, the extra-lateral right, which has caused so much costly litigation in the West, could be abolished with the least disturbance of vested interests, at least such is the opinion of Colby,[5] who says:

"By reserving minerals from agricultural lands and allowing the miner the right of entry for purposes of prospecting under restrictions, with the added requirement that the surface proprietor be compensated for damage, the interests of both the miner and the agriculturist would be conserved. In all the important mining countries of the world, this segregation has taken place, and this is the reason why in such countries the extra-lateral principle is not essential, whereas, in the United States, without such segregation or severance of minerals from the surface, the extra-lateral right has a most powerful additional reason for existence. With severance of minerals and segregation of agricultural and mineral interests, the element of discovery also, now so vital in the mining laws of the United States, would assume secondary importance. Discovery instead of being of prime importance, as of necessity it must be under existing law where no segregation of minerals from the surface exists, could be made a secondary requisite, only required after the mineral locator had plenty of time in which to make a discovery, taking into consideration the difficulty of so doing in particular cases. If the principle of severance is incorporated in a revised public-land law, a vertical boundary system for the acquisition of mineral lands could be simultaneously adopted without resulting in great hardship to the miner, for the agricultural surface claimant could no longer claim the underlying minerals * * * The severance of surface title from the underlying minerals would also discourage speculators and blackmailers who now fraudulently seek to acquire title to surface lands under agricultural laws in order to levy tribute upon the bona-fide mining operator."

Finally, I believe in leasehold tenures for mineral land because it means the socialization of our natural resources, a necessary step, not for Marxian socialism or the public ownership of all means of production, but for the preservation of individualism. As long as there was plenty of government land 'out West' to be had for the asking, the aristocratic tendencies of unrestricted private-land ownership were little in evidence, for the discontented in the settled districts could move to the frontier and become land-owners. But this happy condition passed with the 19th century and the doubling of American farmland-values between 1900 and 1910 marked the end of accessible fertile lands for homesteaders. As only 25% of the arable land was being cultivated in 1910, the remainder evidently was being held for speculation—in order to profit by the unearned increment created by the growth of population and business.

Similarly the profiteers from the forestalling of mineral deposits are in evidence in every productive district and render it hopeless to attempt to moralize industry and put in practice the principle that 'industrial rewards should be in proportion to service rendered'. Until we are willing to become consistent democrats and boldly moralize industry by the socialization of all natural resources we have really little beyond physical weapons for defence against the ignorant excesses of labor-unionism and the criminal violence of Bolshevism. The restriction of private property in land along the lines suggested would inevitably abolish the undue concentration of unearned wealth and its host of attendant evils. The happy ending of the European conflict seems a propitious time for thoughtful Americans to attempt to reconstruct their property laws on a truly democratic basis before it is too late.

Justice v. Sympathy

The Editor:

Sir—I have been an interested reader of the various articles appearing in the 'Press' relative to the present manganese and war metals muddle, and thoroughly appreciate and approve the stand you have taken in the matter. I also have been one of the well-meaning, if misguided, individuals that cast patriotism into the manganese balance, at the urgent behest of our Government, and, with many others, view with dismay an apparent inclination of the Government officials to discount both commodities now that the demand for each has subsided to normal. I say 'demand' with full knowledge of the fact that both patriotism and manganese, as well as the other war metals, were not only requested, but were actually commanded to be produced by authentic communications emanating from the various governmental sources responsible for the supply of those essential war-winning commodities.

You have published several articles in your journal from parties representing, or purporting to represent, the consuming end of the manganese industry, but their arguments embody not a single logical reason for the destruction of a valuable domestic industry by unrestricted imports of foreign-mined war metals, and none of them attempt to justify the Government's threatened failure to keep faith with the miners it induced to enter a patent unprofitable industry under pre-war conditions. The miners of the war metals have the Government's solemn assurance that their patriotic investment of time, money, and labor will be amply safeguarded against loss, and it was accepted and acted upon by them in absolute good faith. To arbitrarily rescind such an agreement and thereby cause the large majority of this volunteer corps of industrial patriots to lose their all would be equally as culpable as for the Government to summarily suspend or reduce the guaranteed interest rate on its Liberty Bonds. To repudiate the former and sustain the latter is to make a distinction without a difference and arbitrarily creates fish of the one and flesh of the other obligation in a flagrant ex parte manner. We cannot picture to ourselves any such policy by *our* Government; it smacks too much of the "scrap of paper" episode of the late unlamented German empire, and satirically recalls the old adage of "when the Devil was sick, the Devil a saint would be, but when the Devil was well, the devil of a saint was he."

It is quite evident that none of the opponents to the Government fulfilling its contract with the war-metal miners have the slightest conception of the obstacles, both physical and financial, that had to be surmounted by the mining fraternity in answering their Government's appeal for the prompt production of these metals; otherwise their pens would not have so smoothly glided along in their course of objecting to justice being done to these men. It is well to add here that the appeal to search out and produce these metals was made directly to the *only* class that *could* produce them. Theirs was the province of specialists in prospecting, mining, and engineering. They alone possessed the ability and knowledge required to obtain the desired results, and to do it upon the spur of the moment. Very few of the opponents of the guaranteed remuneration for their efforts have the ability or knowledge to mine and move a ton of these ores to market, if left to their own devices, and their attitude in the matter can only be ascribed to a complete ignorance of the difficulties and expense accompanying the extraction and transportation of the larger part of the tonnage mined, or else to the fact that "there are none so blind as those that will not see."

They do not realize that the large majority of the manganese, chrome, and other war-metal deposits, occupy the most inaccessible portions of our country, and require the heaviest expense to get in supplies and equipment and the ore out to the railroad. Personally, I am packing ore on mules along a rough mountain trail; thence it is pulled down to the valley on a sled or 'stone-boat', and from there it has to be hauled 26 miles through the mountains over a rough rocky road to the railroad—and all of the trails and part of the road had to be made. Consequently it costs considerably more just to transport the ore to the railroad from where it is mined in the majority of instances than it can be laid down duty-paid on the Atlantic seaboard, at pre-war prices by foreign exporters. Yet our eminent and fair-minded critics assure us—after we have been induced to invest our capital in the enterprise—that this is as it should be, and we should close up shop, charge off our investment of time, money, and labor to a misdirected patriotism and go blithely forth (broke) to evils yet unknown! We are adjured to take our loss calmly and as a matter of course, as all pertaining to the vicissitudes of mining, despite the fact that if under normal peace conditions any mining man with the slightest adumbration of intellect should take on the herculean task of developing mineral in places where his transportation costs alone more than balances the delivered price of cheaply mined imported ore he would have no logical excuse for being at large.

Money is frequently lost in mining, as 'A Miner' succinctly advances as balm to our ruffled feelings, but his sapient conclusion does not apply to the specific case under discussion. True enough, money is lost in mining—as well as made—and chiefly under three heads, to wit: by miscalculation of the quantity and grade of ore in depth from surface prospects, by mismanagement, and through plain deceit and misrepresentation. The first catches all alike, both layman and miner, but is smallest in the case of the highly trained and experienced mining engineer, and while disappointing, it yet leaves no regrets or hard feeling in its wake. Nature has simply proved false to promise; but undismayed, we strive to secure a toe-hold upon her anatomy in some other favorable locality. Mismanagement, and its entrained monetary mining loss, is usually caused by the lack of a competent engineer at the operating end of the enterprise. The third cause of financial regrets in mining can be ascribed to downright fraud and misrepresentation concerning the entire venture. These are perpetrated by a noisy swarm of irresponsible promoters, whom we jail as fast as we can fasten the shackles of the law upon them.

But we can't jail the Government for its failure to carry out its covenant with the producers of the war metals, for indeed, the struggling producers of these metals, as free and law-abiding citizens of our great country, are a component part of the Government, of which they ask but justice, and have given far more as a class toward winning the War than they have ever thought of or expected any recompense from. And it is a grievous mistake of their critics in the present controversy to assume that they are asking for government charity in their present distress. All that they request is the protection they were guaranteed on their investment in a precarious but necessary industry and they will work out their own salvation by their individual energies. Most certainly they do not believe that their Government, after inducing them to invest their all in the creation of a vital industry, which may have to be drawn upon heavily again, will place them on a par with the foreign exporter of cheaply produced ores, that never lifted a finger or ventured a dime toward winning our fight for liberty and justice.

Our conception of plighted troth and good faith does not consist of patting a man on the back and calling him a good fellow, and the next day kicking the props from under him, the while admonishing him to "light easy." We, as a whole, put our shoulder to the martial wheel to secure justice to mankind throughout the entire world, and our worthy President thought it such an imperative desideratum that he felt it incumbent upon him to go across the seas to see the job well done. This is, perhaps, as it should be, but it is well to remark that justice, like charity, should become a household virtue before being bestowed promiscuously beyond the three-mile limit, and plain justice, as embodied in solemn covenants by our Government officials, to protect and sustain the war-metal markets, is what is urgently needed by domestic producers of those metals just now.

F. H. MITCHELL.

Hot Springs, Arkansas, January 13

THE man in charge of a mine store holds a responsible position; storekeeping problems are of vital importance in the economics of a mining company.

Hoisting Accidents

The biennial report of A. J. Stinson, State Inspector of Mines for Nevada, contains the following:

"A perusal of the list of accidents will show that a number of fatalities have occurred as a result of being thrown from a bucket or cage while being hoisted to the surface. In the majority of such cases I find that the hoisting engine-man has had little previous experience as such, or the particular hoist is new to him; and most astonishing of all the engine-man has not secured a license as provided by law. This is the element of human fallibility that always must be faced in controlling accidents. It is perhaps the most difficult of all sources of accident to face. In this connection I made a recommendation in my last biennial report, suggesting that a new and comprehensive law be enacted covering the method of issuing licenses, and I am again making this recommendation. At the present time licenses are issued by the Board of County Commissioners to anybody, upon application, whom they have reason to believe is qualified to operate a hoist.

The law itself suggests that an applicant shall have had one year's experience as a hoisting engineer as a pre-requisite to the issuance of a license, but even that is not necessary according to the interpretation of the Attorney-General. As a result of years of experience I am convinced that fewer accidents will occur if engine-men are required to obtain licenses that mean something, and when once issued carry the dignity and recommendation that a man is a first-class mechanic insofar as the operation of a hoist is concerned. The majority of hoisting-men with whom I have discussed the matter are in favor of such a law. In nearly every walk of life where the lives of men are entrusted to a single individual—as railroad engine-men and steamship pilots—standards of qualification are prescribed, and usually some credentials are required before they are entrusted with the lives of other men. It is my recommendation that all engine-men who are required to hoist men be required to obtain licenses before undertaking such work, and that operators be prohibited from employing men in such capacity unless a license is exhibited. The licenses should be issued, without limit as to number, by a board who shall examine the applicants in detail and give practical tests before passing upon the qualifications. The board should be composed of a technical man, a practical man, and at least one other conversant with mining. Such a law can be put into effect without great expense and without unduly upsetting the existing scheme of affairs of the present operating engineers. Provision can be made for the issuance of temporary licenses upon practical tests in the event of emergency so as not to work a hardship upon the men who must earn a living that way, or upon the operators who may at times require the service of a hoisting-man in an emergency. However, this would be only at the commencement of the working of the act, for in a short time all engine-men would provide themselves with licenses."

The Middlemarch Mine and Mill

By B. M. SNYDER

The Middlemarch mine is situated nine miles west of Pearce, Arizona, in the Dragoon mountains; it is one of the old copper mines of Arizona and was first operated about twenty years ago by Richard Gird and others. They built a small water-jacket furnace and made black copper from the oxidized ore of the Missouri claim, but when the low-grade sulphide ore was encountered at shallow depth, smelting was discontinued. Later they erected a small concentrating plant to treat the sulphide ore, but owing to the high specific gravity of the gangue (mainly garnet and epidote) and the tendency of the copper minerals to float, this mill proved a failure. The extraction was low and the concentrate contaminated with the heavy gangue-minerals. Later an attempt was made to operate the property as a shipping proposition and about 70 carloads of ore were shipped to the smelters at Douglas, for the most part at a loss.

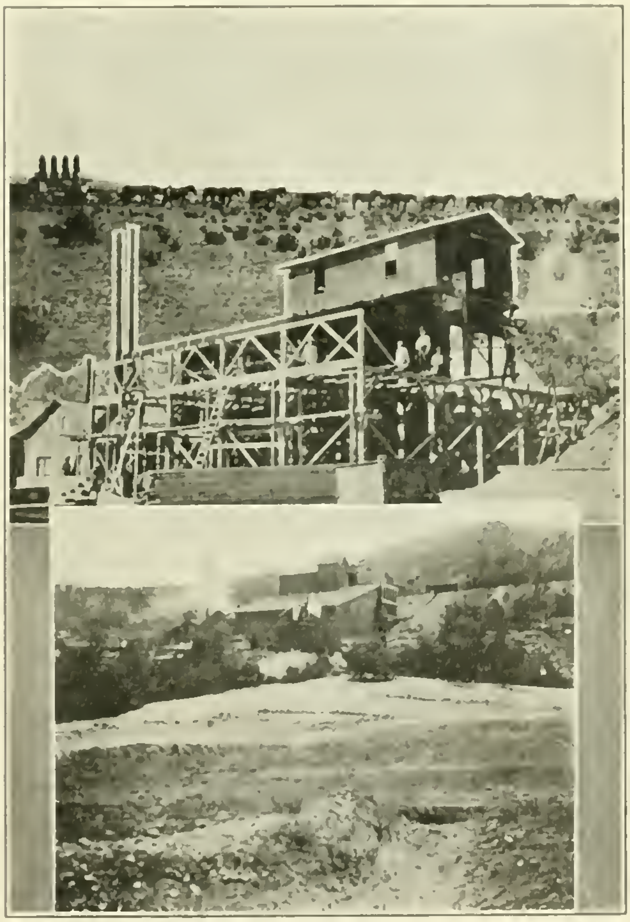
In the early part of 1917 the Arizona Middlemarch Copper Co. took over the property and now owns or controls a total of 43 claims, with an area of over 860 acres. This company is controlled by Los Angeles business-men. They have erected a flotation mill of 125 tons daily capacity, and have demonstrated that the ore is readily amenable to this treatment. Shortage of water, owing to several dry seasons, has prevented the mill running more than a small part of the time, but sinking to reach water at depth is now under way.

The geologic formation consists of a series of Paleozoic sedimentaries that have been extensively intruded by granitic stocks and porphyry dikes. The sedimentary rocks have been so metamorphosed as to obliterate any fossils they may have contained. By correlation with formations the age of which is known, it is believed that the sedimentaries are largely Cambrian. They consist of quartzite, lime-shale, silicious limestone, and clay-slate.

The intrusive granite occurs in stocks of considerable area and along the contacts of such intrusives with the sedimentaries are found altered zones within which orebodies occur. The latter are also found as veins on one or both sides of the strong rhyolite-porphyry (or quartz-porphyry) dikes that cut both the sedimentaries and the granite. There are three strong dikes running the full length of the property and most of the orebodies are found between two of these, or along their contact.

The orebodies are fairly typical contact-metamorphic deposits and are plainly the result of the action of vapors and solutions given off by the intrusives. On the upper end of the property the gossan is found along the contact of the granitic stock with slate and limestone. This gossan shows some copper carbonates and oxides with specular hematite, garnet, epidote, and pyroxene. A tunnel on the Cobreloma vein exposes a vein along the contact of granite and slate, from two to six feet wide, and showing commercial ore in places. This ore carries chalcopyrite, pyrite, and specular hematite, and several carloads of such ore have been shipped to the smelter.

The Missouri orebody is a contact-metamorphic deposit in calcareous quartzite, the shape of the ore being that of a chimney or pipe. On the fifth level this pipe has an area of over 2000 sq. ft., with an oval section and a dip of about 45°. The ore is made up largely of finely crystallized garnet and epidote, with calcite and a little quartz, the metallic minerals being pyrite, chalcopyrite, and zinc-blende. The ore is low-grade, running from 0.5 to 4% copper and averaging, as delivered at the mill, about 2% copper. This is primary ore, showing no sign of enrichment or leaching below a depth of about 75 ft. The residual carbonate ores above this horizon were enriched somewhat and were smelted on the ground.



The Missouri workings reach a depth of about 250 ft. below the surface, and the orebody has been proved to the sixth level. At about 50 to 60 ft. below the sixth level, the inclined shaft passes through a crushed zone (fault-breccia) and below this fault it passes into aplitic granite. At 100 ft. below the sixth level, a station will be cut and a cross-cut driven to the orebody on this level.

The ore has been mined heretofore in large open stopes by milling or similar methods, but a shrinkage stope is now being opened on the sixth level. The ore is drawn off through chutes and trammed to a pocket below the sixth level, and any large boulders are broken on a grizzley over this pocket. A measuring pocket is used to fill the one-ton skip and the latter delivers into a bin on the adit-level, from which the ore is trammed to the mill-bins.

The mill was designed and erected by me. It is a straight flotation mill of the simplest type possible, as shown by the flow-sheet. The ore is drawn to a Telsmith No. 5 gyratory crusher, set to deliver a 1½-in. maximum product. The crushed ore is elevated by a Telsmith bucket-elevator to the fine-ore bin, from which it is fed by a plunger-feeder to a Colorado Iron Works 6 by 6-ft. ball-mill. The balls used are of 2 in. and 2½ in. diam., larger balls having been found unnecessary.

The ball-mill is in closed circuit with an Akins 45-in. classifier, and the pulp discharged by it is elevated by a Byron Jackson 3-in. sand-pump to two launder (or Crerar) pneumatic flotation machines. The froth from these machines goes to a standard K & K flotation machine for cleaning. The finished concentrate from the latter is carried by launders to ponds outside the mill-building. When a pond is full, the concentrate is allowed to drain and dry for about two weeks. It is then trammed to a loading-pocket, from which it is drawn by gravity into motor-trucks for transportation to the railroad, nine miles distant. If the collodial gangue is eliminated thoroughly in the flotation cells, no trouble is found in getting a concentrate dry enough to handle during nine months of the year. During the wet season, this method is not satisfactory.

The tailings from the K & K machine are returned to the roughers for re-treatment, and the rougher tailing goes to a 24 by 8-ft. Dorr thickener for settling and recovery of water. The underflow of the thickener carries 55 to 70% solid, and the clear overflow is pumped back to the head of the mill by a 2-in. centrifugal sump-pump, which also returns all drainage of mill-floors, concentrate-pond overflow, etc. By such means the consumption of water is kept down to an average of 200 gal. per ton of ore treated.

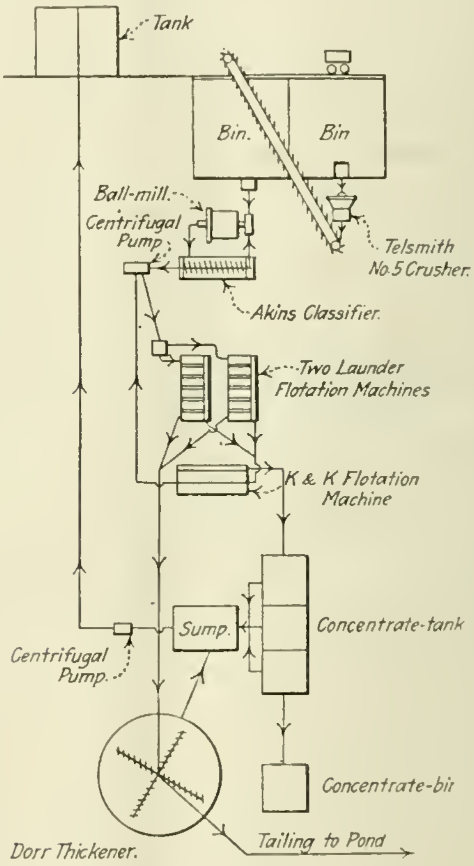
The flotation reagents used are coal-tar, No. 5 pine-oil (General Naval Stores), and coal-tar creosote. Coal-tar makes up 80% or more of the mixture. No acid is used, and the pulp is not heated. A little lime is added occasionally to assist settling in the Dorr thickener and this keeps the pulp slightly alkaline. No changes in the flow-sheet as originally designed have been found necessary, except the substitution of the Dorr thickener for settling-ponds, to recover water more completely.

The following results are averages for the past four months:

1918	Mill-heading %	Tailing %	Extraction %	Solid thickener-discharge %
August	1.49	0.14	91.07	62.8
September	1.64	0.185	89.69	64.8
October	1.92	0.215	89.73	62.8
November	1.64	0.152	91.57	63.0

Ball consumption, 1.23 lb. per ton ore
Flotation reagents, 0.86 lb. per ton ore

The following typical screen-analyses of tailings are given to show that the principal losses are in the coarser sizes, and that by still finer grinding and closer classification the extraction could be brought up to 95% or more. It is doubtful, however, if it would pay to make this additional recovery at the expense of reduced capacity and increased grinding costs.



FLOW-SHEET OF MIDDLEMARCH MILL

	Tailings weight %	Copper %	Tailings weight %	Copper %
On 65 mesh	3.46	0.77	0.66	0.66
" 100 "	16.26	0.22	0.88	0.19
" 150 "	16.48	0.11	16.31	0.15
" 200 "	19.50	0.04	13.50	0.16
Through 200 "	44.30	0.04	62.65	0.04

Tyler standard screens were used in above analyses.

The concentrate is marketed under contract with the Copper Queen smelter, at Douglas, 60 miles south of the property. As showing its quality, the following assays of shipments are given:

Lot number	Moisture %	Silver oz	Copper %	Silica %	Alumina %	Iron %	Lime %
33	10.0	5.30	17.63	13.8	1.2	21.6	4.6
34	9.2	5.78	16.00	14.6	6.5	22.8	4.5
35	12.0	6.30	15.62	15.2	7.1	21.4	3.8
36	13.2	7.30	15.05	13.0	7.8	21.6	3.1
37	11.7	6.34	14.86	18.0	6.0	21.6	3.6
38	16.0	6.12	13.20	15.2	8.2	17.0	5.7
39	13.8	8.26	18.08	7.8	4.6	21.4	3.3

Technical Writing: Naturalness

By T. A. RICKARD

*The key-note of good writing, as of good manners, is *B natural*. Sincerity is the first requisite for effective writing. When a man says what he knows or believes, he is likely to be interesting, because each human being possesses an individuality, a point of view, or a range of sympathy that makes him different from his fellows. To say or to write what you do not think, for the mere sake of talking or writing, is a cerebral exercise that must be performed with extraordinary skill if it is to be attractive. Affectations are rarely attractive, rarely effective. To be natural is to be yourself, not a *poseur*; to give the reader the best of yourself, instead of re-warming the baked-meats of yesterday. Quotations—which are second-hand thoughts—will serve occasionally when the thing you want to say has been said so well by another that it would be waste of energy to try to say it better; but, as a rule, the utterance of the writer himself is more interesting than the quotation, because the writer brings something of himself to bear on the subject and for the moment is more in touch with the reader than any dear departed author. Therefore, say things as best you can in your own way, neither in borrowed words nor in the phraseology that mimics another. Write as if you were speaking to a person whom you are anxious to persuade or convince. You will then write better than you speak, because, in the first place, you can be more deliberate, and secondly, you can revise what you have written.

Speaking and writing are similar mental acts, with a difference: the difference between eating food raw and eating it cooked. Some kinds of food gain nothing by being cooked; likewise some kinds of utterance are not bettered by being written down first; but most expressions of thought, especially those that deal with complex ideas, must undergo preparation before they may be digested comfortably. The transactions of engineering societies are overburdened with half-baked chunks of knowledge that provoke mental dyspepsia. How palatable, on the other hand, is the carefully prepared article that has been seasoned with Attic salt, served with a *sauce piquante*, and dressed with the parsley of pleasant fancy—like the writings of Rossiter Raymond or of Clarence King.

Composition, however, is less natural than speaking. The pen or the pencil intervenes between the thought and the expression, introducing an element of artificiality, as well as one of deliberation. The spoken word cannot be recalled: the written word can be erased. Yet it is unwise to criticize your writing as it proceeds, for such self-criticism tends to embarrassment or self-consciousness. Revise the work carefully after it is done, not before, so as to avoid chilling the warmth of composition by cold analysis. You have heard of the centipede that was too much aware of his many legs, and became hopelessly entangled. Inopportune self-criticism will cripple writing, just as self-consciousness prevents most men from becoming satisfactory after-dinner speakers.

To be natural in writing, you must have something to say: something concerning which you feel impelled to write. To have something to say is the first requisite for effective speaking or writing. Most speeches and many writings are ineffective, if not worse, because, like an unhappy golfer, the speaker or writer does not see the object of his aim; he does not "keep his eye on the ball." Wait until you have something definite to tell. Only a fool talks for the sake of talking: that is why so many speeches fall flat. It is unnatural for a man to write for the sake of exercising his index finger and thumb; that is why so much writing is a weariness of the flesh. Make sure that you have something to say; then say it; and when you have said it, stop. "The best spoke in the wheel is the fittest, not the longest."

The story is told that President Wilson, when a boy, used to read to his father whatever he wrote. Whereupon his father would ask, "What do you mean by that?" He would explain. "Then write it," was the advice. If, after writing something you will ask yourself 'What do I mean?' you may discover that you have not written what you meant to say.

The student while at college, and for some time afterward, is occupied mainly with the effort to acquire knowledge. To write is to convey information to others, which is the reverse of the normal youthful attitude; it involves a pose difficult to assume gracefully or effectively without practice; but such practice should be encouraged, because the effort to record thought involves the mobilization and marshalling of ideas, a disciplinary effort highly beneficial to the student's mind. Therefore it were well if some exercise in writing could be taken during the early process of acquiring knowledge.

To write naturally, you must exercise the faculty of writing until it becomes flexible and strong. The best way to learn how to swim is to plunge into the water. Most of those that write well have written a good deal, but you may be sure that they have not published all of it. Do your preliminary cantering in the paddock, not on the race-course. Good writers obtained their reputation by being wise enough to keep their preliminary trials to themselves; meanwhile, they noted the results obtained from the methods used by others. Ben Jonson said, "For a man to write well there are three necessaries: to read the best authors, observe the best speakers, and much exercise of his own style." Naturalness comes from exercise, not lack of care.

---

*A chapter from a forthcoming book on Technical Writing to be published by John Wiley & Sons, New York.

Aristotle said, long ago: "Naturalness is persuasive and artificiality the reverse; for people take offence at an artificial speaker, as if he were practising a design upon them, in the same way as they take offence at mixed wines."†

Some technical writers, aiming to be natural, succeed only in being sloppy.

(1) "If it is inconvenient to keep the *muck* [waste rock] drawn off, tap the *dirt-way* [ore-chute] a few feet up, on the opposite side of the man-way."

The writer is describing a method of mining and uses the language of an uneducated laborer, perhaps with the idea that it sounds 'practical'. Here are two more examples:

(2) "With the *advent* [completion] of the new mill, which has a capacity of over 100 tons per day, the haulage problem becomes *one for careful consideration* [important]."

Advent means the season before the Nativity; it is also used when referring to an important arrival, not the starting of a stamp-mill. The last sentence in the quotation exemplifies the use of an abstract phrase instead of a concrete word. The language is 'natural' to a semi-literate promoter but not to an educated engineer. Do not mistake vulgarity for ease, nor inaccuracy for freedom.

(3) "The process is said to have done such satisfactory work that other *plants* [operators] have been *contemplating* [considering] the *installation* [adoption] of *the process* [it]."

This also illustrates an uncouthness that simulates naturalness. The writer, a graduate of a university, has fallen into the style of those about him in a mining community. The 'contemplation' of plans, the 'installation' of plants, the 'inauguration' of methods, and the 'prosecution' of developments are the stock-in-trade of local reporters and of the equally illiterate persons that play the mining 'game' on the frontiers of industry. The imitation of them should be beneath an educated engineer.

Young men, when about to describe a mine or explain a metallurgical process, are prone to start with the idea that they must indulge in 'fine' writing; meaning thereby a style pitched several tones higher than is habitual to them. When they prepare matter that is to be printed, they affect a vocabulary and a phraseology foreign to them; like the queer persons that have 'society' manners as distinguished from their behavior at home. There are public occasions, of course, when an added dignity of bearing is befitting. For similar reasons, it is proper that the irresponsibility and ease of ordinary talk should give place to deliberate thoughtfulness when one is making a business statement or preparing matter for print; but the extra effort should not entail a pomposity that smothers the subject in verbiage. The attempt to write in a key higher than that of conversation need not provoke insincerity or affectation. It requires only more care and more deliberation. Write as if you were addressing an honored senior in your own profession to whom you wished to convey information; do not try to impress him with your skill as a stylist, but make yourself perfectly clear, so that he may have the benefit of any facts or ideas that you can place at his service. As a warning, I quote the following description of the Mount Morgan lode, in Australia:

(4) "It may be considered as consisting of a network of veins, traversing on the one hand a metamorphic matrix of a somewhat argillo-arenaceous composition and on the other hand what appears to be a feldspathic tufaceous igneous rock."

This is metamorphosed English pseudomorphic after flapdoodle. Much of the geologic description that poses as profundity is rhetorical rot. Similarly the technical terms needlessly used by half-educated writers remind one "of the French that is spoken by those who do not speak French."

A Tasmanian geologist described an ore deposit as due to "the effects of a reduction in temperature of the hitherto liquefied hydro-plutonic solutions, and their consequent regular precipitation. These ascended in the form of metallic super-heated vapors which combined eventually with ebullient steam to form other aqueous solutions, causing geyser-like discharges at the surface, aided by subterranean and irrepressible pressure. What can you make of this "geyser-like discharge" of language? You will find, if you take the trouble to translate the pretentious terms, that the description conveys a minimum of information with a maximum of sound: "Full of sound and fury, signifying nothing;" or as Ruskin has said, "Great part of the supposed scientific knowledge of the day is simply bad English, and vanishes the moment you translate it."

Here is another sentence written by a young man who also mistook sound for sense:

(5) "Since the installation of their air-compressor, a new campaign of development has been inaugurated, operations have been extensively prosecuted, more particularly in the Carboniferous limestone, which is usually so prolific of values, due to the well recognized leaching of mineral solutions emanating from the plutonic magma."

Many of these words are out of place; a bishop is installed, a president is inaugurated, a criminal is prosecuted, a rabbit is prolific. Incidentally, it may be noted that the water that leached the limestone probably came from above, not from below; originating in rain-fall, not from the depths. These grandiose words, being inappropriate, fail to convey a definite meaning; they only make a confusing noise. Probably he meant to say:

"The use of the new compressor has greatly expedited operations, particularly in the Carboniferous limestone, which has been enriched by mineral solutions."

This, however, is not satisfactory, because the sentence contains discrete ideas, wholly unrelated; therefore they should be separated, thus:

---

†'The Rhetoric of Aristotle'. Translated by J. E. C. Welldon, 1886.

"The use of the new compressor has greatly expedited operations, particularly in the Carboniferous limestone. This is important, because the limestone has been enriched by mineral solutions and therefore is a likely place to find ore."

Samuel Johnson exclaimed: "Witness the immense pomposity of sesquipedalian verbiage;" and we know how he himself sinned in that way. George Meredith, a master of words, recorded his objection to "conversing in tokens not standard coin," which is what 'prosecute', 'install', and 'prolific' are in such a context: they are not legal tender in the forum of technology; they are like Canadian quarters, British shillings, or French francs tendered to a merchant at Chicago or Denver, legal though they be at Montreal, Manchester, or Marseilles. As you know, I hold that the use of words of Latin origin, usually of more than one syllable, is helpful, if not indeed unavoidable in expressing ideas current in technology, but writing becomes incoherent when words are used because of their sound rather than their sense. Such usage bespeaks a snobbishness of mind, the aping of erudition, a mere pretence. If a man knows what a thing really is, he describes it as black or white; if he does not know what it is, he masks his ignorance by saying in long words that it partakes of the general quality of grayness. The young writers that clothe meagre observation in elaborate words soon fall into the habit of using terms that they do not understand, and therefore fail to make themselves understood, if indeed they do not convey information that is positively false. The employment of words that are unfamiliar to the writer, and that therefore are inconsistent with his own way of saying things, serves but to cripple his power of expression. He may get into a tangle by dragging strange words from afar. When he does find himself thus entangled he should cut loose, stating things in his own way, that is, in plain words that he understands thoroughly. Again I say: REMEMBER THE READER. If you do, you will win respect as a writer. The man with only a smattering of his subject splashes all over it with words of learned sound and unlearned meaning, because the ability to make such a noise is more easily acquired than the reality of knowledge. Huxley said that if a man really knows his subject, "he will be able to speak of it in an easy language and with the completeness of conviction with which he talks of an every-day matter. If he does not, he will be afraid to wander beyond the limits of the technical phraseology which he has got up."‡ In his lectures to working-men Huxley showed how the fundamental truths of science could be stated in the simplest and most illuminating speech, without loss of accuracy. Indeed, the ability to explain scientific or technical matters to the unlearned is a test of the thoroughness of a teacher's understanding of his subject. If, for example, you care to test your grasp of engineering or geology, try to impart what you know to a younger brother or sister. That is a good test of your understanding and of your use of language.

No Platinum in the Grand Canyon

Platinum has been reported for many years as occurring in the Grand Canyon, Arizona, near Grand Canyon station. From time to time the supposed presence of platinum ore in this region has received new advertisement, and recently stock in a company organized to exploit the alleged deposits was offered for sale in an alluring prospectus wherein were published assays of the so-called ore that showed as much as 2.4 oz. of platinum per ton. It has been asserted that the platinum occurs in a colloidal state, and that this explains the failure of standard methods of assay to show its presence. The claims referred to in the prospectus mentioned are near Indian Garden, a locality well known to visitors to the Canyon as a point on the Bright Angel trail, about 3250 ft. below the brink of the canyon and visible from El Tovar. Considerable prospecting has been done in this vicinity on both sides of the trail by means of open-cuts and short tunnels, according to the U. S. Geological Survey. The supposed platinum-bearing deposits are beds of green and red ferruginous sandstone that constitute a subordinate part of the geologic formation known as the Bright Angel shale, of Cambrian age. In 1911, F. L. Ransome, while examining certain supposed copper deposits in the Grand Canyon, had his attention called to the alleged platinum ore near Indian Garden, and collected a sample that was afterward carefully assayed for platinum by the Bureau of the Mint. The results were negative. In 1915, H. G. Ferguson was detailed by the Survey to examine and sample the claims near Indian Garden that were being held as platinum-bearing ground. The sampling was done with great care, and about 30 samples were assayed specially for platinum by Ledoux & Co. of New York. As a check, portions of five of these samples were assayed by E. E. Burlingame & Co. of Denver. None of the assays showed any platinum. In the summer of 1918, Mr. Ransome again examined the supposed platinum deposits in company with the geologist who had been engaged by the exploiting company to report on them. He took additional samples, and two of these, selected as representative of the alleged ore, were divided into three portions. One portion of each was submitted for assay to the Bureau of the Mint, one portion of each to the U. S. Bureau of Standards, and one portion of each to the laboratory of the Survey. The nature of the problem was outlined, and the chemists were requested to take all possible precautions to discover any platinum present. None was found. As a result of these investigations it may be safely stated that the supposed platinum deposits in the Grand Canyon do not contain platinum—certainly not enough to be of any value. The claim that the platinum is present in some form that would prevent its detection is an absurdity. Even if the platinum were in a colloidal condition it would give the reactions characteristic of that metal.

---

‡The concluding phrase illustrates how a great writer may lapse into poor English.

The American Mining Congress

By J. F. CALLBREATH, Secretary

*The American Mining Congress was organized in the city of Denver in the year 1896. Its purpose, and at that time its sole purpose, was to secure Federal aid for the mining industry. Its aim at that time was that it should secure the creation of a Department of Mines, with its head a member of the President's cabinet. For several years thereafter it held annual conventions, some of which were important gatherings. They discussed matters of mining in a general way, but took no action except to pass resolutions. At that time it would have been very easy for us, had we created the proper force in an effective way and gone to Washington, to have secured the creation of a Department of Mines; but as time went on there seemed to be a feeling that the President's cabinet was already too large; and when the American Mining Congress in the year 1905 and 1906, at the time it decided to create permanent headquarters and establish permanent work and put a permanent secretary in charge, a feeling had grown up that there should be no new members of the Cabinet. At that time the board of directors met in Denver, and instructed me to go to Washington to find out what could be done. I went to Washington, and after a careful talk with a number of people I came to the conclusion that the effort to secure the creation of a Department of Mines was futile at that time. At the Joplin meeting my report was made to the members of the Congress; and it was then decided after much misgiving and discussion that we should ask for the creation of a Bureau of Mines. Many of our Western people had the notion that there was no mining except in the Rocky Mountain States, and they could not conceive of the fact that we must have Eastern support in order to accomplish our purposes. But at that meeting it was decided to work for the creation of a Bureau of Mines. I was then sent to Washington again to take that matter up. One of the first men that I talked with was the Secretary of the Interior, James Garfield. Mr. Garfield gave no approval to the plan. He did not believe that it was essential or wise, and he thought any effort in that direction would prove futile. Later I had the pleasure of taking the matter up with that distinguished statesman, then President of the United States, who has recently passed beyond, Theodore Roosevelt. Mr. Roosevelt was the first man in an official position to give encouragement to the idea, and said to me that if Congress should see fit to pass a bill creating a Bureau of Mines he would be glad to give it his endorsement. From that time on the fight began for the Bureau of Mines; and in the year 1910 a Bureau of Mines bill was passed, but that bill was so emasculated from the original provisions that it had nothing whatever to do with Western mining; in fact, the words which made it cover the Western mines had been deliberately taken from its provisions; so we were immediately forced to work for an amendment to the bill, and it took another year before the law in its present form was passed by which the Bureau of Mines was given some power to take a hand in the development of Western mines.

As a part of the history of the American Mining Congress it might be well to say that during the first year of the incumbency of the present secretary we had $1100 with which to carry on the work of the organization. During the second year that had grown to $2200. During the year 1910, when the Bureau of Mines bill was first enacted, we had $5600; and at that time while our support had been entirely from the West from a financial standpoint, after that the West seemed to think that the Mining Congress had served its purpose and they had no further use for it, and the support thereafter given to the Mining Congress from the West was practically nothing. In the meantime the coal people saw in the Bureau of Mines bill an agency by which they could get some aid, and the coal industry came to the relief of the Mining Congress, and was its principal support for three or four years after 1910. In the meantime, having secured the creation of the Bureau of Mines, as well as having done some excellent work in other directions, the Mining Congress still felt that it had a mission to perform. It had first to see that the Bureau of Mines got proper support before Congress, and while bureaus are inclined to grow by their own power, it is necessary in order that a bureau of this character shall receive public support that somebody educate Congress to the necessity of the work. In the beginning and when the Bureau of Mines was created its sole purpose, so far as those who passed it (and they were coal people of the East) knew, was that it should make investigations toward decreasing the loss of life in mining operations. Having accomplished that many people thought the Bureau of Mines had done all that could be expected of it. Since then the work of the Mining Congress and its aims have greatly expanded. As conditions arose requiring action at Washington we have tried as best we could to meet those requirements. During the last few years there has been a strong trend toward concentration of power in the Federal government. Whether we like it or not we have to face in the future a strong tendency in that direction. During the period of the War that tendency has increased with untold strength and rapidity. Hereafter we must expect that the national government is going to

---

*An address delivered before the California chapter of the American Mining Congress on January 15, 1919.

control in many matters with which heretofore it has had nothing whatever to do. Personally I do not know whether it is proper to make the statement at this time, but I feel that one of the things in which this organization should take a part is in opposition to the trend of government which has for its purpose the taking away of those rights and powers and duties which the Constitution put upon the several States. This morning's 'Chronicle' had an extended article on the oil industry, and makes reference to the plan of the Federal government to create a bill for the leasing of the power resources of the West. As you gentlemen know, the West stood as a unit against the whole principle of leasing. It believed that each State should control the development of its own resources. It believed that each State should have the benefit of those natural resources. It believed that each State should have the power to tax its own wealth, because it was required under the Constitution to provide and enforce and support a republican form of government, and it did not seem fair that half of the territory of the State should be free from the taxing power of the State while the State within itself was bound to support and protect and enforce the law over that total area. More than half the land west of a north and south line drawn through the eastern border of Colorado is still in Federal ownership. If the West is to be called upon to support the law and enforce the law over that additional half of her territory, she has also the right to tax that territory in order to support the development of that law. The West is expected to build roads; it is expected to maintain its charitable institutions; it is expected to maintain as good, if not a better, educational system in proportion to its population than any other section of the United States; and because of that it is the belief of many men that the principle of the leasing system, which puts the power to tax that property entirely and forever beyond the taxing power of the State, is wrong, and that it cannot work out to the advantage of the country. Just to the extent that the Federal government has the power to tax the resources in your Western States, she is creating a double system of taxation; a system which is not certain; it contravenes that principle of the constitution which says that taxation shall be certain; that we have a right to know the taxes that we have to pay, and that tax depends upon the royalties and the development of our resources. If the conditions are such that the highest development may be secured, then the tax will be large which goes to the Federal government.

This question is not new. So far as I was able for a number of years in Washington I fought that principle and talked against it whenever I had the opportunity. You will find a record of that in many a hearing before different committees in Congress, of the expression of something of the views that I have just expressed to you. However, we had not the power to educate the people of the East. We could not go to Boston with $3000 or $4000 annual income, and demonstrate to the Boston Chamber of Commerce the fact that the harbor was just as much a part of the property of the United States as the water-power in your State. We could not say to them, "If you will consent to the use of this harbor for the benefit of all the people, we are willing that you should have the water-power of California for all the people." We could not say to them, "If you are willing that every vessel that comes into your harbor shall pay a tax to the Federal government for the benefit of all the States, then we are willing that you should collect a royalty from the water-powers of California." I believe that if we had taken that story to the people of the East, they would have seen, first, that it was unfair that this special rule should apply to the Western States and not to the East; and, second, that the centralization of power in the Federal government tended to the destruction of those principles laid down in the Constitution of the United States when the separate States were organized, each with its own powers, and retaining all of those powers except those which were given under the constitution to the central government. I still believe that the principle involved is wrong; and yet after years of fighting against this provision, and after forcing Congress to put liberal provisions into that leasing law, we then got out of the way, and said, "All right. It is the law. We will make no further objection." More than two years have elapsed since the West surrendered its opposition to the principle and said, "Now that you have created a fair leasing bill, which if it were in the hands of the States rather than in the nation would be extremely desirable; now that you have created a fair leasing bill, go ahead and pass it; we object no further." In the meantime this centralization of power idea to which we objected has developed itself; and right now we have the pitiable spectacle from the standpoint of a republican government, that three members of the President's cabinet are quarreling among themselves as to what they will permit the legislative body to do. Secretary Lane has stood for the West. His statement and his position with reference to the leasing bill are fair to the West. Secretary Daniels and Attorney General Gregory are saying, "We won't permit you to pass that bill." I cannot help but feel that if this Government is to be maintained in the future as a republican form of government there will need to be a more careful defining of the rights and powers of the several departments of government. I do not believe that the executive power can say to the legislative power, "You can pass only such a law," and, following that up, tell the Congress how they should construe that law, and still maintain a republican form of government as laid down by the constitution. And therefore I believe that the present situation is one filled with danger.

Now if I were to say what I think ought to be done, I would say to the conference committee, which for months and months has been wrangling over the provisions of the bill to which they may agree after it has been passed by both houses of Congress, and its members taking their advice from the executive department of the Government, I would say to those gentlemen, "You will either pass that bill before the 4th day of March, and if you fail the West will again take up its cudgel against the whole principle of leasing, and you will have to fight if you ever pass a leasing bill."

That is one of the things which the American Mining Congress has been endeavoring to do, to see if a leasing bill were passed that it should contain this provision which should enable it to operate fairly, and under which the resources of the West might be developed. The War has taught us among other lessons the great importance of the mining industry. Never before have we realized that as a nation, without the development of the mining industry, without its operation in the hands of those who understand the business, the nation could not carry on its work. We have been brought face to face as a nation now with the importance of mining. We have discovered another thing, namely, to the extent that those operations were interfered with by people who had no knowledge of the business disaster was sure to follow.

I want before I leave the leasing bill proposition to say a word on another matter. Alaskan coal was available, and should have been poured into your industries along the Coast long ago in unlimited quantities to the full extent of your needs; but because of the desire for a leasing bill in Alaska the coal could not be mined. The story is long; I will only touch upon it. A leasing bill was finally enacted. It seemed to be within the province of the Federal government, owning Alaska as a Territory without any State duties put upon its people, that a leasing bill there might apply. The leasing bill was passed. Until the present year there has been no production under the law. Alaska had coal which the tests showed conclusively was better, if there was a difference, than the Pocahontas coal for the use of the Navy; and yet last year, at a time when this nation was girding up its loins to meet the great emergency of the War, and when coal was needed by all the Western industries, when the railroads were overburdened with the carrying of the coal to the industrial centres of the East, at that time railroad trains were starting from West Virginia with coal to be carried away across the continent to deliver to the Pacific Coast navy—one of the fruits of the interference of the Federal government with the development of Western resources.

The American Mining Congress has for its duty to look after matters of interest to the mining industry in different parts of the country. These matters are partly national matters. I have sometimes been reprimanded somewhat for using a term which has grown to be somewhat out of repute with many people, but not with me, because I believe that the man who says that he is not a politician is not a good citizen. I believe that every citizen in the United States should be a politician and take part in the carrying out of his responsibility to the Government; and I believe that wherever there have been failures in our governmental policy it is because individuals have not been politicians. Therefore I say that the American Mining Congress has for its special business mining politics. We are not afraid to say to Congress, either Democrats or Republicans, "It is not good politics or bad politics, but it is the business of mining that we want you to consider. It has peculiar problems that you do not understand. We know you will be fair to us if you understand our conditions;" and we know that having 36 members of Congress west of the Missouri river. I have insisted for years that the West was that section of country where two different systems of law prevail; where the doctrine of riparian rights has been set aside absolutely and the doctrine of appropriation of water has taken its place; where the side-line theory of ownership has been set aside and where the doctrine of extra-lateral rights prevails for mining. I am not arguing as to the advantage of this. I am saying that where that system of law prevails is a country which has conditions entirely different from those understood by people in the East; and therefore we need to present to those people the conditions under which, and under which alone, we can develop the Western country as it needs to be developed, and therefore that we ought to be in a position personally to appeal to every man where it is essential to improve conditions hindering the mining industry. Therefore we are anxious to so extend the work of the American Mining Congress that it shall have one man at the head of its several departments of mining who can be better posted on that subject than anyone else can hope to be. Heretofore the Mining Congress has staggered along with a Secretary that has tried to keep himself posted as to chrome and manganese and oil and coal and gold and silver and all of the various branches of mining, and jumping from one subject to another. While he may, because of the justice of his cause, have made some success, he has never been able to do the work as it ought to have been done. During recent days there has been a development which looks toward a great extension of our work. We are proposing that there shall be eight divisions of the mining industry; that the precious or rare metals shall constitute one division; that the ferro-iron and the ferro-metals shall constitute another division; that the base metals, lead and zinc, shall constitute one division. The plan is to appeal to the mining men of the country to create new funds in order that we may have at the head of each one of these divisions some one man who may put in his time in equipping himself upon that and be accounted as the authority in the United States on that subject. This cannot be done in a day. At the Arizona meeting the day before yesterday they adopted a plan of support of this organization. The plan was first to ask each industry to contribute a fund composed of 10 cents of each thousand dollars of its production. It may be that in future years that assessment will not be sufficient. It is barely possible it may be too much now. We do not know. But we want at the head of each one of these departments a man who not only has the knowledge of the business, who can visit your plant and know exactly the conditions of your production, and be almost as able to present your case as you could yourself, but in addition to that, may inform himself as to all the avenues of approach through which the plain justice of your demand may be presented to the proper authorities. We believe that such a man will be consulted by Congress when it wants to know about these things. We want that man capable of going to the President, if the occasion requires it, of going to anyone wherever he may be, and be recognized as the representative of that branch of the industry.

The most important question which faces the American people is the relation of labor and capital. It comes vitally home to the mining industry as it does to every other industry. There was a time when individual employers each worked by himself, and as time went on we found that organized labor was acting as a unit. It is no criticism of organized labor when we say that in many instances it gained advantages which it was not entitled to, because they acted for their best interest, and they had a right to press their cause. Upon the other hand, the employers of labor were entirely disorganized. In a recent questionnaire which was sent from our office I received one peculiar answer with reference to this question from the President of the 5th and 9th Coal Districts of Illinois. He said if he had his way no man should be permitted to have a job who did not belong to the union; and no employer should be permitted to carry on his business unless he joined the association of others in that business, so that there should be perfect mutuality. He said that the danger in the labor world was the professional agitator; that if you forced people to join the union you did away with the necessity for agitators. Whether that is true or not, I do not agree with the principle, but it is worth considering. This thing is true: in the future there is going to be a different relation between employers and employees. I believe that the employers should undertake an educational campaign, and should themselves endorse the principle that the workmen should receive the highest wage which it is possible for the industry to pay. You employers should fight for the maximum wage, not the minimum wage. Right now we are faced with a peculiar condition, and it is up to us now to show our good faith in the matter. We cannot, when work is scarce, when men are being turned loose without employment, say, "Wages have been high. Now we are going to starve you. You must take the minimum wage." No, the employers of this country are not going to take that position, but there are many men who think we take that position unless we show that our desire is to pay the maximum wage possible. Now a maximum wage may not be maximum if we get a proper service for it. In the inquiry which I sent out with reference to the gold industry, practically all of the replies were to the effect that they were paying 25 or 35% more wages, and receiving 35 to 50% less in efficiency. If we can say to the working men, "We are going to pay you every dollar that this industry will bear, and upon the other hand we expect from you the best service which you can render; we want from you the highest efficiency; we are willing to pay for it," then I think we can go further, and point out to the employee that out of the total product of his own and his fellow workmen the production is to give the luxuries which he enjoys. In other words, one principle which organized labor has advocated, and which I believe is wrong, is to the effect that you must not do too much work, for if you do there won't be jobs enough to go around. That I believe to be intrinsically and fundamentally wrong, and if we expect to increase the luxuries of the laboring men we must increase his production, we must increase his efficiency, because out of the total sum of production these luxuries come. If we produce more the excess supply in the market will depress prices; that is one of the natural rules; and as a result the wages which you pay him will go further and their wages are worth more to them. I believe that a campaign of education along this line will do much to bring more harmonious relations between capital and labor; it will convince the laboring man that we want to be fair to him, but that if we pay him so much that the cost of goods is so high that the market won't use them, the lack of use will come back, and there will be no demand and no production and no work. A few years ago I made a study of production, and I found that when we shipped 5% of our goods to foreign markets we have pretty poor times in this country; when we ship 7½% we have fairly good times; when we ship 10% we have flush business conditions. So we must ship from 7 to 10% to foreign markets to keep the men employed and the capital at work. If that is true, that 10% must be produced cheaply enough to find a market in competition with more cheaply produced material there. I am not of those who think that the amount of dollars you pay for a day's wage is the whole criterion. It is a question of efficiency; and when we can instill into our workmen the belief that they are working squarely with us in order to increase production, and make that production as cheaply as possible to the consumer, and because of the cheaper production there will be an increased demand for work, and we have thus brought about the right condition, and when we have done that we can hope that the laboring man, no longer feeling that his employer is opposed to his interest, will join in making a hand in hand fight together to develop the best interests of the industry in which they are both engaged.

GOLD OUTPUT of the Rand last year was 8,416,000 oz. In 1917 it was 9,022,263 oz., 9,295,538 oz. in 1916, 9,093,671 oz. in 1915, and 8,394,320 oz. in 1914. A diamond weighing 388½ carats (1231 grains, or 2.56 ounces) was found at the Jagersfontein mine in Orange River Colony, adjoining the Transvaal, last week. The famous Cullinan diamond, found in the Premier mine near Pretoria, Transvaal, weighs 3025 carats, or over 1½ pounds.

SINKING at the Seneca copper mine in Michigan cost $305 per foot. The 3-compartment shaft was vertical to a depth of 1450 ft., after which it curved slightly to 1629 ft., where the Kearsarge lode was cut. The shaft is lined with steel and is therefore fireproof. The above cost includes all shaft work and surface equipment, the latter equal to $100 per foot.

The Economic Duties of the Engineer

By W. R. INGALLS

*What engineer is there who does not know that the essential assumption of pure democracy as applied to industry—that production should be controlled by the people themselves—is in direct antithesis to the fact that in modern industrial life efficiency of production has increased as the efforts of the many have been directed and organized by the talents of the few? Must not every engineer of experience in leadership agree with Mallock, the great philosopher, that the oligarchic principle is as dominant in industry as it is in political democracy?

But superior to all industrial and political principles are economic laws, for it is those laws, which are laws of nature, that create and determine principles and practices. One of the greatest of economic laws is that of the survival of the fittest, which exhibits itself in competition, and from that is derived the classic economic doctrine that labor is the residual claimant upon the produce of industry. After the shares of the State, the landlord, the capitalist, and the entrepreneur have been deducted, all the rest goes to labor, and here is what is mystifying to many, to wit, rent, interest, and profits are limited by competition, and of them the laborer can get neither the share of the landlord nor of the entrepreneur, by any economic means, while, as for interest, the residual claimant is benefited by every payment on account of capital used in the production of wealth, and is better off when a high rate of interest is being paid than when a low rate is paid. We may apply the principles to the concrete case of the United States.

The wealth of the United States at the end of 1916 was estimated at about $250,000,000,000. The production of things was about $50,000,000,000. These are very rough figures, as they are bound to be. Estimates relating to this subject vary considerably. I have mentioned the highest that I have seen. There is reason to suppose that the higher figures are more nearly correct than the lower. Anyhow, I am going to use the highest only to give an approximate idea of proportions. This was before the United States entered the War, and, according to the United States Bureau of Labor, we had 4,000,000 workers. Let us assume that rent, interest, and profits averaged 4% of the wealth of the nation, which would hardly be extravagant. That would account for $10,000,000,000 out of the total produce, leaving $40,000,000,000 for labor, or $1000 per worker. We have already seen that 2,000,000 railway workers and 250,000 iron and steel workmen received about that sum. Those figures are specific expressions of two whole industries. The workmen in some other industries earned more; in some they earned less. However, there is considerable evidence that the general average was about that figure, or something near it, and, anyhow, whatever error in statement there may be will not invalidate my following argument.

That labor does not get increased wages at the expense of capital (unless capital be confiscated, in which event the increased wages will not long endure) is illustrated by the experience with the railways in Great Britain and America. The governments guaranteed the bond and stockholders their average return for a series of pre-war years. In the United States this was $1,000,000,000 per annum, or just about 5% on the capital as reported by the Interstate Commerce Commission. The increase of $800,000,000 in wages has been paid by the public in higher freight and passenger rates. To have left the roads in private hands, compelling them to pay higher wages without permission to make higher charges, would have resulted, first, in impaired service and finally in the State having to take over the lines and supply the deficit in order to have any service at all, just as has happened with some of the street railway lines in Massachusetts. Thus, what is virtual confiscation aids the wage-earner only slightly and only temporarily.

But apart from confiscation, the winning of increased wages by one group of labor is obtained only at the expense of other groups. The inequality in the distribution of wealth is not between the capitalist and the laborer, but rather is it among laborers themselves. There is ample ground for the surmise that the professional, clerical, shop-tending, and similar classes, and the salaried classes generally, have suffered especially at the hands of the railway operators, mechanics, artisans, builders, and miners, but the farmers and the factory folk have not been immune.

I am not going to enter upon any fine analysis of the very rough statistical data that I have given, and shall point out merely that after the State, the landlord, the capitalist, and the entrepreneur have got their taxes, rent, interest, and profits, of which the last three are severely limited by competition, labor gets all the rest, and what it gets is what it produces. The only way it can get more is to produce more.

It is unfortunate that the only way of expressing production is in terms of money. If it were possible to express it in terms of goods, there would be less misunderstanding. However, it is clear that if the total goods and the total population remained the same, it would not matter if the money value of the goods fell from $50,000,000,000 to $30,000,000,000, that is, it would not matter at all if money wages fell from $1000 per annum to $600, as, indeed, they would fall inevitably. On the other hand, if commodity prices remained the same, and the value of products should rise from $30,000,000,000 to $50,000,000,000, labor would get so much more, for it would be producing more goods. This is the only way that the war scale of wages can be maintained, and it is a problem of capital, labor, and talent to co-operate in accomplishing it, for only by co-operation can it be done.

This is no preaching of capitalism as commonly understood, but is simply classic and proved economic doctrine.

---

*Abstract from presidential address before the Mining & Metallurgical Society of America, January 14, 1919.

One Phase of the Railroad Problem

By N. H. EMMONS 2nd

The railroad freight rate is the one question in connection with our whole transportation scheme that cannot have said of it that it is based on actual work performed. From the railroad owners' standpoint the question of earning interest on the capital invested is the first consideration. The second question is the return to labor for work done. The public is interested in these two, but is more interested in the efficient and economical movement of people and material.

Whether the railroads are operated by the Government or by private owners is largely a question of whether the public be allowed to choose their own investments or whether they all be forced to own a part of all the railroads. Operation by the Government means that if there is a loss the Government pays it and takes it from the whole people in the form of taxes. Government operation and ownership mean that instead of a group of interested owners electing their representatives to operate their road, the general election for President of the country will be the basis of deciding who will operate the railroads, and each time the Government changes its head there will be a new secretary of transportation, who, of course, will need new men under him.

Before the War people were satisfied to pay an average of two and one-half cents per mile for passenger service. Special or lower rates were made for various reasons. There was mileage, or rates based upon a great deal of traveling; there was commutation, or rates based upon a large number of people traveling a short distance daily; there were through rates, to cover long trips; and there were party rates, whereby a number of people made a trip from one station to another as a party. The public was satisfied and made selection of localities to live in and roads to be traveled over according to the advantages offered.

Express, which may be considered a branch of the freight service, was paid on the basis of value of goods, weight or bulk of the goods, size of shipment, and distance between point of origin and destination. The essential difference between freight and express service is the time element. There does not seem to be any basic reason why the railroads should not handle the express business of the country. Our railroad business has been built up by private ownership. It is the most efficient transportation in the world and it would seem a good policy to let well enough alone.

But the question causing continual irritation between the railroads and the public is that of railroad freight-rates. The public is willing to pay for service rendered, but wants to know what the basis of the charges is. It has often been said, and is probably very near the truth, that rates are based on the principle of charging all the traffic will bear. There is no justice in this. How are rates arrived at? A shipper goes to the railroad and asks for a rate on a new movement. The railroad makes a thorough investigation of all conditions, ascertains as nearly as possible the cost of production, the selling-price of the commodity at the market end, advises the shipper what it thinks should be the rate, and proposes to the Interstate Commerce Commission this rate. If the party asking for the rate happens to be familiar with the system he puts in a brief to the Commission independent of the railroad; if not, there is but one side of the question offered for the Commission's enlightenment, and the rate is granted. After the shipper has become more familiar with his market he finds that competitors have better rates than he has and goes before the Commission asking relief. This is a most unscientific, unsatisfactory, and irritable way of adjusting rates; and yet on account of custom it is considered the only way to make them.

Here we are with prices of commodities that were never dreamed of before, with railroad rates higher than ever before, with business conditions unsettled by the idleness of many plants, and with a complete new start in many things facing us. Now would be the time, if ever, to make an adjustment to new conditions. We are entering a period when capital must begin to go into new industries, when the rates being paid to labor are more nearly equal all over the country, thus eliminating the question of unequal wages, and when the establishment of manufacturing concerns should be located with reference to nearness to market and short railroad haul rather than to labor market.

There should be a railroad freight-rate commission appointed by Congress to study the question and propose a new order of things promptly.

The purpose of this article is to suggest a method of making rates based on service rendered, forgetting the old system and the old divisions of territory, and looking at the question broadly and with an eye to the future.

What is the service rendered by railroads in handling freight? First there is the cost of receiving goods. Second, the transportation of these goods. Third, the delivery of the goods at the destination. If the first and the third are considered as fixed quantities, as they do not depend on the distance between origin and destination, a fixed sum can be charged for this service. The transfer from one railroad system to another involves extra cost for work done and special accounting, and a charge for this should be made. The main variable is the transportation. This variable contains several points that should be recognized in basing rates. They are distance hauled, value of shipment per unit of weight or bulk, and quantity handled. There should be an inducement offered to railroads to originate traffic and to take especial care of its section of the country. The following suggestion for basing rates is offered at this time for serious consideration by the American public.

First, allow a charge for receiving, transfer, and delivery of freight, these charges to be added to the charge for hauling.

The hauling charge should be made up with two main variables, distance hauled, and value of material hauled, and two lesser variables, size of shipment, and section of the country traversed.

The first variables can be dealt with as follows. Establish a base rate depending on the value of the material, and allow a discount for length of haul.

The base rate should be made up somewhat as follows:

Value of commodity per ton or 80 cu. ft.			Base-rate per ton-mile, cents	Value of commodity per ton or 80 cu. ft.			Base-rate per ton-mile, cents
Up	to	$1.00	0.20	$100.01	to	$200.00	1.50
$1.01	"	5.00	0.30	200.01	"	500.00	2.00
5.01	"	10.00	0.40	500.01	"	1000.00	3.00
10.01	"	20.00	0.50	1000.01	"	2000.00	4.00
20.01	"	50.00	0.75	2000.01	up		5.00
50.01	"	100.00	1.00				

The variable for distance hauled starts with the base rate and allows a discount for length of haul. For the first 100 miles or fraction thereof, charge the base rate for distance hauled. Thus on the fourth classification of 0.5c. base.

For 100 miles the rate would be.			0.50c.
For the next 100 miles	10% off, or		0.45
100	"	5% " "	0.4275
100	"	5% " "	0.4061
100	"	5% " "	0.3858
100	"	5% " "	0.3670
200	"	5% " "	0.3487
200	"	5% " "	0.3313
500	"	5% " "	0.3147
500	"	5% " "	0.2990
1000	"	5% " "	0.2840
All above 3000		5% "	0.2698

On this basis a haul of 3000 miles would be at an average rate of 0.3268c. per ton-mile, or $9.80 per ton for a commodity worth between $10 and $20. One ton of copper falling between $200 and $500 in value would cost $39.18 to haul 3000 miles and a ton of lumber $9.80 for the same haul. To these rates should be added the receiving, delivery, and transfer charges.

The value of one ton of copper, on a pre-war basis, was $280 (ten-year average) and the freight-rate from Montana to the Atlantic seaboard was $10.50. The value of lumber in Idaho was around $30 per 1000 feet, or somewhere between $15 and $20 per ton, and the freight-rate was $15 per ton, or from $22.50 to $30 per 1000 feet for the same haul.

QUANTITY. It costs a great deal more to handle small shipments, that is, less than a carload, and an increase of perhaps 25%, should be allowed for less than carload shipments with a receiving and delivery charge added. It costs less to handle a train load than a car from one station to another, and a discount should be allowed for train-load shipments.

LOCALITY. The country has been divided into three sections for the purpose of rate-making. The North, which meant north of the Potomac and Ohio rivers, and east of the Mississippi; the South, which was south of the Potomac and Ohio rivers and east of the Mississippi; and the West, all west of the Mississippi. The country has grown since this division was made and a new arrangement is needed, perhaps allowing the classification by value to be moved up one mill, on points west of a new western line or covering what may be known as the Rocky Mountain section.

Our present system of rates has favored certain manufacturing districts and has congested certain lines to the limit. Many localities could be built up if rates were equalized to a greater extent. Such a system as the one outlined will have that tendency. Everyone will say at the first glance that this is impossible or impracticable, but looking deeply into the question will show that this idea will give the greatest benefit to the greatest number of our American people.

THE ROCK, chiefly flint, in the Joplin zinc-lead region of Missouri, is hard and brittle, and rapidly wears the cutting edge of drill-bits, but because of its brittleness it is more easily fractured by the concussion of the drill. In some of the mines the gangue-rock is tough, so that the footage per shift is less, whereas in other deposits it is more or less soft and the footage for the same amount of time consumed in drilling is much greater than the average. The average footage for drilling in sheet-ground is 20 to 50 ft. per 8-hour shift for each drill, varying with the character of the ground and the skill of the drill-man. Changes every two ft. are often necessary. —U. S. Bureau of Mines Bulletin 154.

FLOTATION of galena at Broken Hill, New South Wales, was discussed by the Institution of Mining and Metallurgy on November 21, when V. F. S. Low said, "taking Broken Hill as an instance in which, along a very short line of lode, there were such great variations in the ore treatment methods of the several companies concerned—variations which were in great part due to the difference in the ores mined—the engineer who contemplated undertaking selective or other flotation would be well advised to first put up an experimental unit and thoroughly test the treatment of his ore before finally committing himself to any finished design."

DREDGING FOR TIN by the Tongkah Harbour Tin Dredging Co. in Siam, during the year ended September 30, 1918, cost 10 cents per cubic yard. This is exclusive of depreciation. In 1917 the cost was 8.8 cents. Five boats worked 34,346 hours, during which they dug 3,383,250 cu. yd. The average yield was 0.87 lb. of tin per yard, equal to 31.4 cents. The total tin oxide recovered was 1314 tons, equal to 69.34 to 73.34% metal. This is an Australian company that pays regular dividends.

DURING 1918 the Brazilian Minister of Finance arranged with the St. John del Rey and Ouro Preto mining companies, both British corporations, that the Government acquire the whole gold output of these properties, owing to the embargo on exportation of the precious metals. Up to the end of 1916 all gold from Brazil went to England. Exports in 1915 totaled 142,000 ounces.

REVIEW OF MINING

PIONEER, NEVADA

Resuscitation of an Old Gold District.

Some interesting work is now in progress at Pioneer, five miles north of Rhyolite and 60 miles south of Goldfield. It had a memorable boom in 1908, and is again the most active mining centre in the region south of Goldfield. Plans are being made to start work on several other properties in the district, besides those described in the following notes:

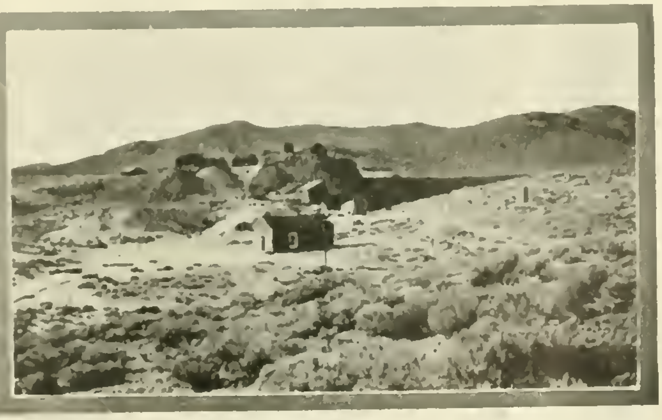
On December 26 work was resumed at the property of the Consolidated Mayflower Mines Co. with sufficient men to work two shifts, under direction of J. B. Kendall, president and manager. Prior to this the 500-ft. main incline shaft and some of the drifts had been re-timbered. All mine and shaft timbering was destroyed by fire in January 1912. Repairs to shaft and surface eequipment were completed within a few days, and drills of the Waugh 'turbo' type were brought in by express. Drills are breaking ground rapidly on four levels—the 200, 300, 400, and 500—and five working faces in good milling ore, assaying from $12 to $35 per ton The ore is oxidized and free-milling down to the 500-ft. level; water-level is at 510 ft. Records of former production are incomplete, but show a net profit of $158,000 from 11,053 tons. During this period, mining costs averaged $2 and milling $3.53 per ton. Development had been confined for the most part to the 300-ft. level, where a stope was opened 300 ft. long, yielding 10,000 tons of $14 ore. A smaller stope on the 400-ft. level produced ore of higher grade. A pumping station on the 500-ft. level was the only work at this depth.

Surface equipment was found to be in good condition. The Ingersoll-Sergeant compressor will operate 15 of the new drills and is driven by a 90-hp. Western distillate engine. A 32-hp. Fairbanks-Morse engine is used for hoisting and a similar engine provides power for the mill, a 6-hp. engine of the same make driving the solution pumps. This machinery was put in and used for a short time before an electric power-line was extended to the district. Power service was discontinued in 1916 and the engines, accorded good care, are as good as new. The 15-stamp mill is to be re-modeled and increased by the addition of a ball-mill. Formerly, coarse crushing resulted in heavy metallurgical loss, and a large part of the impounded tailing assays from $3 to $6 gold per ton. Water for milling is pumped from below the 500-ft. level of the mine. The ore is trammed 100 ft. from the collar of the incline shaft, over a Fairbanks scale, to a grizzley, the fine falling to the ore-bin and the coarse passing to a 9 by 14-in. Blake jaw-crusher; thence to the ore-bin, and fed to the batteries by Challenge feeders of the Joshua Hendy type. After passing 40-mesh screens the pulp flowed over 4 by 12-ft. silvered copper plates, where a recovery of 50% of the gold content was made by amalgamation. The pulp was then elevated to a Dorr classifier, the sand passing to ten 5 by 16 leaching vats for cyanidation, the slime being impounded below the mill. It is said that the available power will be adequate with the added ball-mill, and it is proposed to complete these changes at an early date.

The geology is described as a readily distinguished series of rhyolite flows, in part brecciated and with strata, varying greatly in width, of red volcanic mud. A number of fault-planes are observed, but displacement is negligible. The ore-channel is a fissure striking N. 55° W. and dipping SW. from 60 to 70°, and averages 5 ft. in width. The Starlight incline shaft, 1400 ft. north-west of the main shaft, was sunk 93 ft. in ore of milling grade, and a hanging-wall cross-cut on the 85-ft. level, out 30 ft., exposed 6 ft. of $12 ore in a parallel vein. Near this shaft the vein was sampled for 60 ft. by 3-ft. cuts at 3-ft. intervals, giving an average of $51 per ton. A winze from the 400-ft. level of the main shaft was sunk 80 ft. in ore assaying from $12 to $25 per ton. The vein was cut recently on the 500-ft. level, where it was 12 ft. wide, with 18 in. of ore on the hanging wall assaying $30 per ton. Winzes are to be sunk from the 500-ft. level to determine the character of the ore below water-level.

The main shaft of the Reorganized Pioneer Mines Co., formerly the Pioneer Consolidated Mines Co., has been re-timbered to the bottom—400 ft.—and sinking is again in progress. The shaft will be sunk at least to 800 ft., following recommendations of J. K. Turner, the consulting engineer. His report points out that the orebodies found on

REORGANIZED PIONEER MINES CO'S MILL AND SHAFT.



CONSOLIDATED MAYFLOWER MINES CO PROPERTY AT PIONEER.

existing levels are broken masses of quartz, with no semblance of vein formation, and he holds that these quartz-zones may be found at depth to assume the form of veins. He sees no geologic reason why enrichment should not be found to persist in depth. The mine has produced nearly $600,000 from ore and bullion shipments, the famous Bonanza stope, opened above the 200-ft. level, yielding over $300,000 in shipping ore, and breaking a $100 product across 30 ft. The 10-stamp amalgamation and cyanide mill operated continuously for several years, with costs lower than those of any plant in southern Nevada, but was closed as a result of the withdrawal of electric power service.

BISBEE, ARIZONA

Exploration in the C. & A. Mines.—Labor and Employment.—Warehouses and Change-houses.—Demand for Copper.—Tungsten Mining.—Cananea, Sonora.

While no statement has been given out by either of the large operating companies here—Calumet & Arizona and Phelps Dodge Corporation—it is known that development of the class styled as 'pioneering' is retarded to some extent by the failure of several hundred skilled miners now in the army to return here. Only a small proportion of the men enlisted in army, navy, or war work has arrived in Bisbee since demobilization began. All of these are being given positions upon application, either their old ones or others of equal grade. The C. & A. service flag contains 447 stars, of which about 400 were miners, and that of the Copper Queen branch of Phelps Dodge more than 600. A change in the rule of employment by the companies has been made, as this is now offered only to returning soldiers and sailors. Formerly soldiers, sailors, and men who had worked for the companies for two years and within two years, were employed.

Built along fire-resisting lines the Copper Queen supply warehouse on the site of the one destroyed by fire on October 31 is now ready for business. Floors are of concrete, and a sprinkler system has been installed.

Drifts from the Junction shaft of the Calumet & Arizona, leading east toward the Denn-Arizona company's western line, have not yet reached their objective, which is the rich orebodies opened by the Denn between the 1000 and 1600-ft. levels. However, the Junction workings are in favorable looking ground, particularly at 1600 ft. The other drift is at 1400 ft. Driving toward the Denn, particularly on the lower level, has been tedious and costly. The problem of ventilation has been difficult, while the distance material had to be brought from the surface has been another handicap. The Denn orebody extended directly up to the eastern line of the Junction, so the one feature the C. & A. has to look to in its exploration of this ground is to ascertain how far it extends into its property. The drifts when completed will be 2000 ft. long. This is the largest amount of strictly development work in the C. & A. properties in new territory, just at present.

A party of engineers from the Anaconda at Butte and others recently visited Bisbee. Among them was Dr. L. D. Ricketts, who said that nobody could predict anything for copper at present as there was no demand, not even a reliable quotation for the metal. Reduction both in forces and output to avoid tying up great quantities of unsaleable bullion is the policy observable throughout the industry, he said.

Work has been started on a new change-house at the Lowell shaft of the Copper Queen, built along the same modern lines as those recently completed at the Czar and Holbrook mines. A change-room is to be erected at the Gardner as soon as that at the Lowell is finished, giving employees of Phelps Dodge every comfort. The locker system allows wet clothes to be hoisted on pulleys to the roof of the building, where free circulation of air soon dries them, doing away with much of the discomfort experienced under old conditions. The change-houses are scientifically heated and supplied with baths.

Closing of the lead concentrating plant of the Shattuck-Arizona took place on the afternoon of January 15; 40 men employed were laid-off, as were 45 engaged in mining lead-silver ore. This step was taken because of the low price of lead and unsatisfactory mining conditions. The Shattuck mill was completed less than six months ago, and included a flotation process evolved for treating this ore after long experimentation. Recovery was said to be very high. No reduction at present is contemplated in the copper mining forces of the company.

Deep snows in the Huachuca mountains, 40 miles southwest of Bisbee, preclude operations of the Tungsten Reef Mining Co., excepting on construction of a mill for concentration of ore from three large blanket veins. The crusher for the plant already has arrived on the ground, also the boilers. The ore is said to contain a high percentage of tungsten, also some gold. A pipe-line to supply the mill with water is being laid from springs in the mountains near-by. A. J. Clark of Montana is president and treasurer, L. E. Porter vice-president and secretary, and G. D. Kislingbury superintendent. It is expected to re-open the mining about mid-February.

Though fully 1500 employees of the Cananea Consolidated Copper Co. at Cananea, the Democrata Mining Co., and Calumet & Sonora have been discharged during the last few weeks, there have been no disorders in the camp, and few of the men have remained. Most of them with their full families have gone to southern Sonora, where less rigorous weather and cheaper food have offered inducement. According to mining men arriving at Bisbee the total output of Cananea will be cut from a third to a half.

DEADWOOD, SOUTH DAKOTA

Position of Gold Mining in the Black Hills.

Mining men recently met here to discuss the gold production of the Black Hills. The principal speaker was H. W. Seaman, president of the Trojan Mining Co. He covered government regulations, cost of supplies, the fixed price and cost of producing gold, the embargo on gold exports and premiums paid for the metal in foreign countries, and the cost of cyanide. He was not in favor of the proposed premium for gold, but thought that if the Government made an open market for it there would be a remedy for present conditions.

The following resolutions were adopted on January 10 by the Black Hills Mining Men's Association:

Resolved, That the Legislature of the State of South Dakota be, and it is hereby respectfully petitioned and urged to memorialize the Congress of the United States to take, as promptly as possible, such appropriate action as may be effective to grant the fullest relief to the gold-mining industry of the Nation, including (1) a removal of all restriction upon the sale of bullion, either in domestic or foreign markets; (2) a more liberal allowance for depreciation, including exhaustion of mines; (3) a substantial release from the payment of taxes occasioned by the War, inasmuch as the gold industry was a sacrifice for the Government during the period of the War, and wholly subordinated to the winning of the War, and was during that period and still is being operated at a loss, we only ask for a square deal and an even break; (4) the good offices of the Government in securing for us reasonable prices for the machinery and supplies necessary for the successful operation of the gold-mining industry, and in aiding and abetting all endeavors to increase the production of 'new' gold; and (5) any direct assistance given the gold miner as a prospector or producer during the period of reconstruction which will as much or more than any other measure be instrumental in stabilizing the markets of the world in all other commodities, as gold is the bedrock foundation of all national and international transactions.

JEROME, ARIZONA

Operations Curtailed at the Big Mines.—Developments at the Small Mines.

On account of the copper market both the United Verde Copper Co. and the United Verde Extension Mining Co. are cutting-down their working forces and lessening production of the red metal. About 300 men have been laid-off at Jerome, Clarkdale, and Verde, and the U. V. Copper Co. has closed one blast-furnace, while the Extension is working only one furnace and on lower-grade ore than usual. Due to the lay-off and the fact that returning soldiers are being put to work, there is a large surplus of labor in the district at present, and notices have been posted at the outside railroad station warning those seeking employment that there is no chance of securing work at the present time in the Verde district.

Prospecting by diamond-drilling is again being done at the Calumet & Jerome, a contract for three or four holes, comprising over 2000 ft., having been let to the Diamond Drilling Company.

A small force is at work at the Shea mine extracting and sorting the ore from the west drift on the 350-ft. level. Sufficient is now ready for a second shipment to the U. V. X. smelter at Verde. The first shipment of 13 tons netted about $2800.

The superintendent of the Pittsburgh-Jerome, Charles Arata, is still awaiting the arrival of certain compressor parts necessary for the starting of the machinery before work can be resumed on a large scale.

A depth of over 1275 ft. has now been reached in the shaft at Verde Combination, and it will take two weeks more to attain the 1300-ft. level and allow for a sump below that point. For the first 100 ft. below the 1080-ft. level the shaft was in a well-mineralized bluish-black schist. The formation from 1200 ft. down and up to the last few rounds is a hard diorite and jasper. Recently the shaft has been passing through a hard silicious quartz, and the last round has broken into a soft schist, fairly well mineralized in pyrite and chalcopyrite, and showing some specks of bornite. The formation all appears to dip toward the north-west.

At the Gadsden, under development by Calumet & Arizona, the cross-cut being run north-west on the 1200-ft. level recently cut through a water-course 900 ft. from the shaft, exposing several small pockets of native copper. No driving was done on this formation and the heading is being continued on toward the north and south fault, a distance of 1800 ft. from the shaft. The heading has now gone 1050 ft. passing through a quartz-schist. The last few rounds are showing a soft decomposed schist. Occasionally evidences of chalcopyrite are to be seen in the formation.

Extraction from the Maintop orebody of the Jerome Verde continues at the rate of over 20 tons per day, and shipments are still being made to the smelter at Humboldt. The value of the ore remains at around 9%.

Driving both ways on the contact on the 900-ft. level from the Dorothy May shaft of the Green Monster is still being done at this property, and while nothing of an important nature has been opened in the work so far, there have been occasional evidences of mineralization.

The Jerome Bisbee Copper Co. was recently organized to take over the defunct Jerome Portland Mining Co. Late last year the properties of the latter were bid-in at a receivership sale for $14,000, by parties interested in the welfare of that company, and an option has been given the new company that will permit of the purchase of the property at the same figure The Jerome Bisbee is capitalized at 1,500,000 shares, 50 cents par. The property, which has been grossly mismanaged in the past, is well thought of as a prospect, and lies adjacent to the Copper Chief, Shea, Green Monster, Equator, and Jerome St. Louis, and 3½ miles south-east from the town of Jerome.

Grand Island has been attracting more than the usual attention during the past few weeks, not only locally, but in various outside quarters as well, where the demand for the shares has been brisk. The 500-ft. level has been reached, with 30 ft. below for a sump, and a station is being cut. This work should take from 10 to 12 days, after which a cross-cut will be run north-east to cut the vein. It is estimated that a distance of only a little over 100 ft. will have to be driven. However, as there are three distinct veins showing on the surface near the shaft, one of which is said to be the rich Shea vein, other lateral development will be initiated later on. In the meantime, ore is being extracted from the drift run from the bottom of the 40-ft. shaft, and will be shipped to the smelter. The vein now shows a width of 3 ft., and contains good value in copper.

DENVER, COLORADO

Further Notes on Meeting of American Mining Congress.—Drainage-Tunnels.

At the meeting of the Congress held here on January 2, topics were: 'Advantages of Co-operation with U. S. Employment Service', 'Freight Rates', 'The State Metal Mining Fund', 'The Colorado Mining Situation', 'County Organization', 'Modern Mine Promotion', 'State Legislation and the Mining Industry', 'Proposed Blue-Sky Legislation', 'National Legislation and the American Mining Congress', 'The American Gold Conference', 'National Aid for the Metal Mining Industry', 'Relief for Producers of War Minerals', and 'Colorado War Minerals'. Lively discussions were elicited by some of these papers, especially the one proposing a blue-sky law as drafted and presented to the meeting by one of Denver's prominent brokers. One critic believed that Denver bond-dealers do not, under any circumstances, assist in financing new mining ventures, no matter how legitimate they may be; but that they devote their efforts to knocking metal mining and to trading in bonds and securities of companies in other lines or industry, usually of Eastern origin. The majority of speakers on this subject felt that the greatest good to all concerned would result by passing State legislation requiring stock-selling concerns of all sorts to publish complete figures and facts relative to their businesses. The effectiveness of straight publicity in squelching illegitimate promotions was amply proved in Denver last year in the application of a new and simple ordinance. This provided for the appointment of a commission whose duty it was to investigate personally all new oil and other promotions and to publish their findings in the local press. The commission was given no authority to bring action of any other sort against guilty promoters, but it did its assigned work. The results were not only effectual but prompt, all questionable concerns quickly scampering to cover.

The secretary of the American Mining Congress, J. F. Callbreath, outlined his plans for enlarging the usefulness of the organization this coming year by the establishment of eight departments in his Washington office, each in personal charge of a capable man, to deal with all sorts of legislative and legal matters arising in the several branches of the mining industry. It is planned to grant free service to all mining men of the country who may, at any time, require special information or assistance at Washington.

At times the sessions were enlivened by humorous remarks and stories. For instance: when U. S. Senator-elect

Lawrence C. Phipps, well known nationally as a steel magnate, spoke informally, he surprised the audience somewhat by his frank ignorance on mining and his statement that he had never put any money into metal mining. Upon the conclusion of his address, Bulkeley Wells, the president, announced his intention of appointing a committee of five to immediately sell Mr. Phipps a gold mine; whereupon the senator arose and solemnly explained that his wife had warned him in advance that somebody at the meeting would try to do that very thing and he had promised to refrain from any such purchase.

Because many large mining tunnel projects in Colorado had proved failures, the opinion prevailed a few years ago that enterprises of this nature were risky from the investor's standpoint. There are, indeed, scattered about the State abandoned large development or drainage-adits of this kind offering mute emphasis to this opinion. Some of these projects absorbed considerable expenditure of money without attaining any measure of success. There had been a period when tunnel-sites were a popular subject in every rugged mining region.

There have been a few decidedly successful tunnel enterprises. Among these there was one great project holding undoubted promise from the moment of its inception, that has been in process of excavation for about 11 years and that has finally attained its predestined goal: the Roosevelt deep drainage-tunnel at Cripple Creek, 24,225 ft. long, is finished. [An article describing the work will be published in the 'Press' in the near future.—Editor.]

TORONTO, ONTARIO

Canadian Metal Output.—Dividends From Ontario Mines.

The total value of the mineral production of Canada during 1918 is estimated by the Canadian Department of Mines at $220,000,000, compared with $189,646,821 in 1917. The production of the more important metals was as follows: gold, $14,750,000; silver, 20,800,000 oz.; copper, 117,000,000 lb.; nickel, 91,500,000 lb.; zinc, 36,000,000 lb.; pig-iron, 1,182,000 tons; and steel ingots and castings, 1,010,000 tons. Coal production was 15,180,000 tons, against 14,046,759 tons in 1917.

During the past year, twelve of the gold and silver-mining companies of northern Ontario paid dividends, nine being silver and three gold producers. The dividend-payers during 1917 number twenty in all, fifteen of them silver and five gold mines. The aggregate amount paid in dividends in 1918 was $6,381,477, not including the profits of private corporations, which would bring the total up to over $7,000,000. Dividends paid in 1917, including private concerns, amounted to $7,726,843. Total dividends paid since the beginning of mining in northern Ontario to the end of 1918 amount to $91,065,110.

PORCUPINE, ONTARIO

Labor Available and Re-opening of Mines.

Since the closing of munition plants in Canada a large number of the men released have gone to northern Ontario in search of employment. Most of them have been absorbed by lumber companies, and the pulp and paper mills, but many have obtained work at the mines. The shortage prevailing at Cobalt has almost been made up, although the working forces at Porcupine and other goldfields are being steadily increased, there is still a great demand for men. It is estimated that the present requirements of Porcupine alone, without making any allowance for new development, could give employment to 2000 more men.

At the Dome Mines the staff has been largely increased. New supplies are being purchased for the mill, and preparations are being made for the resumption of ore treatment as soon as an adequate working force can be secured.

It is officially announced that mining will be resumed at the West Dome Consolidated in the spring.

The Davidson, which has opened extensive orebodies of fair milling grade, is expected to become a large producer in 1919. The company has obtained control of the Bilsky property adjoining.

The Porcupine Crown will resume operations when sufficient men can be secured. The workings have been kept unwatered, while the mill is in good condition.

Kirkland Lake.—Interest is increasing in the southern section of this field, the leading prospects of which are the Ontario-Kirkland, Canadian-Kirkland, and Hunton-Kirkland. At the Ontario an electrically-driven mining plant, costing $15,000, is being put up. The shaft will be sunk from its present depth of 100 ft., to 300 ft. The Drummond interests of Montreal are negotiating for control of the Canadian-Kirkland, consisting of approximately 150 acres, on which a number of large and well-mineralized veins have been found. Should the deal go through a large amount of money will be expended.

Boston Creek.—The Miller Independence has been encouraged by the exceedingly favorable developments to proced with the construction of a new mill several times larger than the 40-ton plant now in operation. It has been decided to increase the capital from $500,000 to $700,000, also to provide for electric power and other improvements.

On the Campbell claims, in a direct line with what is considered to be the strike of the main vein of the Miller Independence, a strong vein has been opened containing free gold and tellurides.

Porquis Junction.—The Alexo Nickel Co. is steadily producing nickel ore, which is shipped to the Mond Nickel Co. plant at Coniston in the Sudbury district, for treatment. During the week ended November 22, the company shipped 137 tons. It is the only nickel producer in Canada outside the Sudbury district. The grade of the ore is high, and as mining is principally done from an open-cut, costs are low.

CRIPPLE CREEK, COLORADO

New Work at Some Small Mines.

Lessees of the El Paso Consolidated, operating on the C. K. & N. vein from the Roosevelt tunnel-level, are mining ore that averages between $30 and $40 per ton. The tunnel connects with El Paso No. 1 shaft at a depth of 1300 ft. The ore is being mined by raise 80 ft. above the tunnel. The shoot under development has been proved to the eighth level of the shaft, 1150 ft. from surface.

The Phoenix Mining Co., C. W. Howbert manager, is retimbering the Conundrum incline where shaft-timbers were burned out recently. The timbers were destroyed to a depth of 200 ft. below the collar. The incline is 1500 ft. deep vertically. This is the deepest working on Gold hill.

Operations have been resumed on the Kalamazoo on Bull hill, by lessees of the Elmohar Gold Mining Co., who are unwatering the shaft. The property was originally owned by the Alert Gold Mining Co., W. H. Reynolds of New York president. The new company was formed on the expiration by limitation of the Alert charter.

Kissell & Phelps, lessees of block 8 of school section 16, have commenced to break and hoist ore from the main shaft on the eastern slope of Bull hill. This is the only property on school land in the district that has paid royalties to the State.

The output of the Vindicator mines for 1918, it is reported, closely approximates the present market price of shares. The annual report is now with printer. The company paid a 1-cent dividend—$15,000—on January 25.

THE MINING SUMMARY

ALASKA

Juneau.—Telegraphic advice states that Territorial officials issued a warning on January 27 to laborers to stay away from Alaska for at least two months. On account of the reduction of copper-mining operations several hundred experienced men are now out of employment, and more will be out by February 1. All the largest mine operators are taking returning soldiers back to former positions, and these, in view of the number of men let out, will fill all vacancies likely to exist for some time, it is said. Work at the canneries and placer fields of the interior will not be available before April 1.

ARIZONA

Ajo.—A school is to be erected here costing $129,000. Plans were prepared by Lescher & Kibbey of Phoenix, while the lowest bid, as above, was by Edwards & Wilder of Los Angeles.

Chloride.—Campbell & Scott are reported to have taken an option on the Argyle and Elkhart mines here.

Dragoon.—J. T. Long, manager of the Arizona United Copper Co., in the Johnson district, is authority for the statement that practically all shipments of copper from the district have ceased.

Globe.—One hundred and twenty-five employees of the Iron Cap Copper Co. recently received a $50 Liberty Bond each as a bonus for six months' steady work. The Iron Cap in 1918 produced 57,291 tons of smelting and 27,399 tons of milling ore, yielding 9,441,000 lb. of copper and 153,585 oz. of silver. The surplus at the end of the year was $334,170, a gain of $47,668. The Iron Cap shaft was sunk 111 ft. to 1126 ft. depth. An electric 3-ton skip hoist is to be installed. The Williams shaft is down 1200 ft., and is connected with the Iron Cap.

It is reported that J. D. Coplen has given a 30-day option to the Development Company of America to examine the Porphyry and Barney mines, which adjoin the Inspiration.

Oatman.—At a recent meeting of the Arizona Mossback Mining Co.'s shareholders it was decided to issue $400,000 in bonds, to be used in construction of a mill and for other improvements.

Wickenburg.—The Bullard mine has been bonded to B. C. Wilson, W. Douglas, and E. Bemdurant. It is claimed that the mine contains 300,000 tons of 4% copper and $5 gold ore. A leaching-plant may be erected at Aguila on the Parker cut-off, also 8 miles of railway.

CALIFORNIA

Idria.—New Idria Quicksilver company is laying off 40 men daily (to total 240) owing to the condition of the quicksilver market. The operating force will then amount to between 110 and 150.

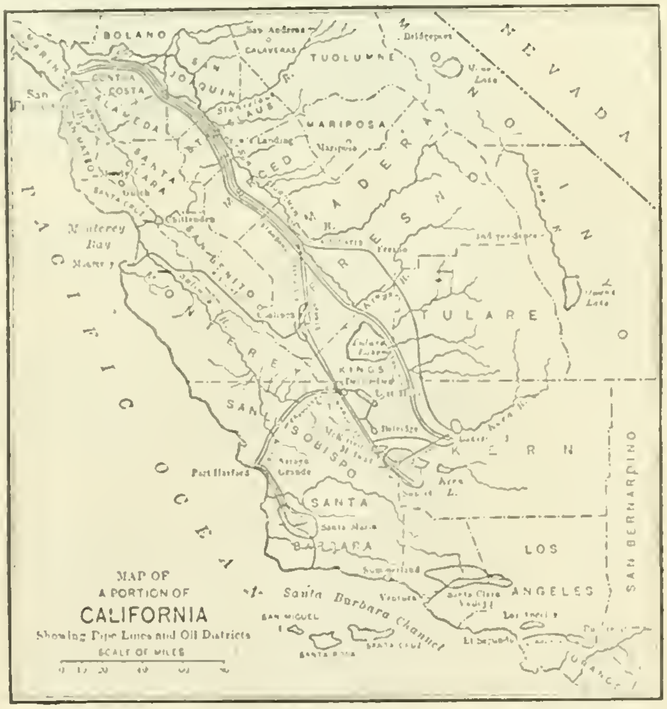
Porterville.—Erection of additional machinery, costing $20,000, at the plant of the Porterville Magnesite Co. is practically finished.

The magnesite industry of this district is steadily returning to the condition of pre-war days. Daily shipments out of Porterville at present average two carloads. The building of the McKnight Fire Brick Co.'s plant in this city is expected to further stimulate the magnesite business. This company, controlled by Los Angeles people, is to erect a plant here for magnesite, chrome, silica, and clay brick. The corporation has secured, through the Porterville Chamber of Commerce, a five-acre tract in the south part of the city at the junction of the Santa Fe railroad and the Southern Pacific's branch line. The first of six units will have a capacity of 10,000 magnesite brick monthly.

Redding.—The 'Courier-Free Press', edited by W. H. Fink, has issued a Prosperity Edition. Among the interesting reviews we find illustrated descriptions of the Bully Hill and Mammoth copper mines, dredging on Clear creek, and the Noble Electric Steel Co.'s reduction works.

San Francisco.—The State Mining Bureau has issued the following circular:

The various industries and the people of California are almost entirely dependent upon petroleum for power and fuel. They must be assured that all possible precautions conducive to a stable and long-continued supply are being taken. The question of whether or not their interests in this regard are to be protected is now definitely before the State Legislature. A bill introduced by Senator Thompson and Assemblyman Argabrite provides for serving the public interest and that of all the industries dependent upon oil, either through its consumption or production. The bill is based upon the result of the intimate study and investigation made by the State Mining Bureau in the oilfields during the past four years, and combines all the best features developed during the enforcement of the present law. It provides regulations requiring that all oil-wells, even those belonging to powerful but careless concerns, shall be drilled



MAP OF
A PORTION OF
CALIFORNIA
Showing Pipe Lines and Oil Districts
SCALE OF MILES

and maintained in such a manner that the oil deposits will not be ruined merely to obtain quick profits to a short-sighted operator. The interests of oil operators are safeguarded through sure and speedy action of the Superior Courts by injunction proceedings against possible error or abuse of power by the State officers. No change in the present general policy of co-operating with and providing for the interests of oil operators is contemplated. Certain oil-producing concerns who have never recognized that the public is vitally interested in the preservation of the oilfields, and have always opposed adequate State supervision, have introduced other bills. Realizing that absolute repeal of a conservative measure would not meet with public approval, their ultimate object is concealed by provisions that would leave merely the skeleton of an impotent law on the statute books. In order to allow no possibility that even a skeleton law might be operative, they further propose to put the enforcement of the law into the hands of a few large oil producers.

COLORADO

Caribou.—In the old Caribou mine near Boulder, J. G. Clark, the owner, with some lessees, has opened a shoot assaying up to 3000 oz. of silver per ton. Two carloads of rich ore was shipped last week.

Leadville.—The Mt. Champion gold mine in Half Moon gulch, above Twin Lakes, will probably be re-opened at an early date. It was closed in May last.

IDAHO

Bonners Ferry.—The Cyanide Gold Mining Co. has been incorporated with a capital of 3,000,000 $1 shares to operate the Deer Creek Gold Mining Co.'s property 20 miles east of this place. A cyanide plant is to be built at once. J. B. Ellis, G. R. Caustin, G. and J. La Fountain, and F. Lafear are largely interested.

Kellogg.—On Pine creek the Nabob Consolidated is erecting a concentrating plant to cost $50,000.

The Coeur d'Alene Antimony Mining Co. recently re-elected M. E. Jolley as president. C. M. Powell of Kellogg is secretary. The mine has considerable ore-reserves, and the new concentrating plant awaits a favorable market.

Wallace.—The mining position in the Couer d'Alene district remains unchanged, according to the 'Miner'. The reduced price and lack of demand for lead has re-acted on production, causing curtailment generally; and, with the exception of two mines that have closed down, this reduction in output is being accomplished without reducing working forces to any great extent so far.

The Big Creek Mining Co.'s compressor building was destroyed by fire last week. Included were a motor, compressor, machine-drills, shop tools, etc., valued at $2500. This was covered by insurance. The plant is to be renewed.

MICHIGAN

Houghton.—Mass Consolidated has reduced miners' wages to $4, and trammers and unskilled workers to $3.75 per day, 75 cents less than the scale in force since October 1918. There are 318 men employed, against 450 in normal times. The men will work 6 days a week.

The Victoria company has also lowered wages 15%.

Copper Range will neither reduce wages nor production, as it is already at only 75% capacity.

Wolverine and Mohawk are producing at less than 70%.

Lake Copper Co. suspended work indefinitely on February 1. The output in 9 weeks was about 900,000 pounds.

Quincy has reduced operations by 25%.

The Franklin president frankly told employees last week that they must revert to the old wage-scale, with elimination of the 20% bonus, or else have the mine closed. The men have accepted the inevitable.

After January 20, Calumet & Hecla and subsidiaries are to work four days one week and five the next, alternately, equal to 75% capacity.

MISSOURI

Joplin.—Production of the Tri-State region last week was as under:

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	1,009	..	126	$51,956
Missouri	1,077	30	121	47,235
Oklahoma	6,801	..	1,100	351,642
Average price...	$42	$30	$60	......

The Mining Edition of the 'Joplin Globe' for January 26 contains a section of especial interest on mining and milling methods.

NEW MEXICO

Socorro.—The New Mexico State School of Mines has issued Bulletin No. 2, 'Manganese in New Mexico,' by E. H. Wells. This is a well-arranged book of 85 pages, with map. In the 'Press' of November 23, 1918, we gave an abstract of this report, as published by the U. S. Geological Survey.

TEXAS

Houston.—The recent incorporation, with headquarters here, of the Universal Sulphur Products Co., with a paid-up capital of $12,000,000, marks the addition of large financial interests to the sulphur mining and manufacturing industry of this State. W. C. Hardcastle of Houston, representing New York and Boston men, holds most of the capital of the company. Others interested are Henry Oliver of Pittsburgh and E. F. Simms, H. T. Staiti, John Hamman, F. P. Phair, C. H. Lane, and S. A. Millican, all of Houston. The company owns a 7000-acre tract at Damon Mound, near the mouth of the Brazos river, which is largely underlaid by a sulphur bed, as proved by drillings. Prospecting the land for sulphur has been in progress for some time, and it is reported that a great tonnage already has been found. This sulphur is in the same section of the Gulf Coast region as the big producing property of the Freeport Sulphur Co. It is announced that the Universal company will spend a large sum in plant for extracting the sulphur from the ground, refining it, and manufacturing sulphuric acid.

Orla.—The West Texas Sulphur Co. of Philadelphia has placed in operation three furnaces of its new refining plant near here. These units have a total capacity of five tons of sulphur per day. It is planned to enlarge greatly the capacity of the plant.

Valentine.—Extensive exploration is being made of nitrate deposits south of here near the Rio Grande. They are owned by the Capote Nitrate Co. of San Antonio, of which Guy C. Simpson is president. The work is under direction of Carl Halter, formerly of Chihuahua.

UTAH

Eureka.—Chief Consolidated during 1918 yielded 2,354,797 oz. of silver, 4099 oz. of gold, and 8,019,454 lb. of lead, against 1,534,907 oz., 9175 oz., and 10,780,540 lb., respectively, also 600,360 lb. of zinc, in 1917. Ore shipments totaled 66,019 tons. Walter Fitch is manager.

Morrissey.—The Utah Sulphur Corporation has two retorts yielding 40 tons of refined sulphur daily. Another shift being added is expected to double the output. When the three new retorts are finished, each of the five will treat 105 tons of ore per day. On this property is a large dump of old tailing, said to carry 42% sulphur. According to the general manager, M. P. Morrissey, if this material averages 31% sulphur, it will be treated in a machine of his own design.

WASHINGTON

Spokane.—Provision for the regulation of mining companies, while avoiding the 'vicious' features of the blue sky laws, is the object of a plan now being worked out by the Northwest Mining Association, which discussed the problem at a recent session here.

OREGON

Homestead.—Of the $2,100,000 of gold and other metals produced in this State during 1918, the largest proportion came, as usual, from Baker county, which produces annually 90% of the gold mined. One of the properties is the Iron Dike, in the Homestead district, at the terminus of a branch line from Huntington. This mine is controlled by Goodrich Rubber Co. interests, under the name of the Iron Dyke Copper Co. The mine is opened by shaft and tunnels. The 150-ton mill includes a ball-mill, tables, and flotation plant. Concentrates assay around 15% copper, 8 oz. silver, and $8 gold per ton. Up to 100 men are employed in charge of E. F. Gilligan. The company pays considerable attention to the social life of its employees.

MILL OF THE IRON DYKE COPPER CO. AT HOMESTEAD, BAKER COUNTY, OREGON

CANADA

British Columbia

Kaslo.—The Gibson Mining Co. is laying a spiral-riveted pipe 2200 ft. long to carry water under a head of 825 ft. This will drive a generator, compressor, etc. A mill may be erected to concentrate the lead-silver and zinc ores. A. C. Brintnall is in charge of the new plant being erected.

Three Forks.—The Rambler-Cariboo company pays a dividend of 1 cent per share on February 15. This is equal to $17,500, and makes $560,000 to date. The surplus is $55,000. A large snowslide recently covered the flume carrying water to the mill, resulting in a short shut-down. W. A. Cameron is manager of this lead-zinc mine in the Slocan district.

Trail.—The Mine Owners Association of the Province will not recognize the Committee that has been authorized by the Dominion government to investigate the rates charged for ore treatment by the Consolidated Mining & Smelting Co. at Trail, according to a statement issued by C. F. Caldwell, president of the association.

Manitoba

The Commissioner for northern Manitoba, R. C. Wallace, in a review of mining in the Province during 1918, published in 'The Daily Nugget', says that steady progress was made, and that with construction of a railway and a smelter a large copper industry is assured. At the Flin-Flon, diamond-drilling continued until July, when preliminary work in mapping-out the orebody was finished. A large tonnage is available of $10 ore, remarkably uniform in value. The Mandy mine sent 6300 tons to Trail, B. C. Duluth people were drilling at the Chicu claims near the mouth of the Pine-root river. On the north-east of Lake Athapapuskow is some promising copper ore. The Rex mine at Wekusko lake yielded gold worth $21,550 from May to October. Operating conditions are not favorable so the result is good. The mill includes a 30-ton Lane mill, two amalgamating plates, two Deister-Overstrom tables, a 60-hp. engine, two 60-hp. boilers, and a 320-cu. ft. air-compressor. The Pas Consolidated Mines acquired the Dauphin-Elizabeth mine.

Ontario

Cobalt.—The Adanac company is to send 50 or more tons of ore to the Temiskaming mill. In the new vein being opened there is 6 to 8 in. of ore, much of it carrying from 2000 to 4000 oz. of silver per ton. The formation is the Keewatin.

MEXICO

The United States Ambassador to Mexico, Henry P. Fletcher, while at St. Louis on January 29 on his way to Washington, said conditions in Mexico are rapidly improving, avenues of commerce are opening, and when restrictions against trading are removed the United States can resume business relations with Mexico on a larger scale than ever before. The principal barrier, he said, is the condition of Mexican railroads, and until equipment is supplied from America it will be difficult to carry on business. He termed as false reports that large numbers of Germans crossed the border into Mexico when the United States declared war.

Formal announcement of the organization of the National Association for the Protection of American Rights in Mexico with a membership representing 41 concerns in the oil, mining, smelting, agricultural, land, cattle, rubber, banking, and other fields in that country, was made at New York on January 29, by Frank J. Silsbee of Los Angeles, its secretary. Declaring that "gross injustices have been committed in Mexico to American citizens and American property rights," the Association plans to make "a thorough study of the Mexican situation from historical, legal, and economic standpoints," and to furnish from time to time to the United States and Mexican governments "accurate information regarding foreign industries and enterprises, decrees and other developments affecting American rights, with a view to removing causes of friction." Among the concerns represented in the new association are the Mexican Petroleum Co., Standard Oil Co., the Texas Company, Panuco Boston Oil Co., Greene-Cananea Copper Co., Phelps Dodge Corporation, Guaranty Trust Co., National City Bank, J. P. Morgan & Co., National Bank of Commerce, Chase National Bank, Bankers' Trust Company of New York, the Yaqui Delta Land & Water Co., the California-Mexican Land & Cattle Co., and the Inter-Continental Rubber Company.

Information reaching Washington states that Carranza had reorganized the Mexican army to a considerable extent, obtained sufficient arms and equipment, and had started a new campaign against the rebels and bandits operating in different parts of the republic. Several bands of rebels surrendered unconditionally with their commanders, the reports said, and other groups dispersed, the men promising to return home, while the leaders either fled or were captured. The States of Jalisco and Guerrero have been cleared of rebels, according to these advices, together with the extermination of the band under Pedro Zamona, with headquarters near Autlan. Zamona was wounded and later captured.

General Barcenas, one of Zapata's commanders, was reported to have surrendered unconditionally with his force to the Government army in the State of Guerrero, this being the last armed band in the State opposing the Government. The rebels also have been suppressed in the State of Morelos, it was stated, while the forces in Pueblo and Tlaxcala laid down their arms. General Aguilar has been placed in command of the reorganized Government force sent against Diaz. The advices reported that five generals, with other officers of lesser rank, had been ordered to Chihuahua for a new campaign against Villa.

In an address before the Investment Bankers' Association of America at Atlantic City on December 10, George E. Roberts of the National City Bank of New York said: "If conditions in Mexico were as favorable to the employment of capital there as on this side of the line, there would be a great flow of capital into Mexico and quick leveling of living conditions there to what they are in this country. And, finally, the development of Mexico and of her now idle resources would react beneficially upon this country."

Chihuahua

Chihuahua.—The Mines Company of America is to be reorganized by the sale of its assets to the Dolores Esperanza Corporation, which will have 864,802 shares, as in the old company. Upon payment of $2 and the deposit of one share of existing stock, the Mines company's shareholders may subscribe for one share of the new corporation. Hayden, Stone & Co. are behind the arrangement. Ore-reserves in the various mines are valued at over $6,000,000, based on silver at $1 per ounce.

Hidalgo

Pachuca.—Santa Gertrudis reports for the quarter ended September 30, 1918, that the working profit was £74,914 ($360,000). The mill treated 70,272 tons of ore, yielding silver and gold worth £204,135 ($979,000). The crushing rate was 70% of capacity. By the addition of two Merrill filter-presses the rate has been increased to 90%. The ore is now of a more colloidal nature, so the settling area is being increased by rearrangement of tanks and addition of tanks from the Guadalupe mill. An 8-ft. by 48-in. Hardinge ball-mill has been ordered. Aluminum-dust has replaced zinc-dust permanently. Development amounted to 1699 ft., of which 429 ft. was in pay-ore. In El Bordo mine there was 896 ft. of work accomplished, mostly short cross-cuts to determine widths of veins. These were as under:

Level	Width, ft.	Silver, oz.	Gold, dwt.
445	23.2	10.1	0.81
450	9.9	10.4	0.92
450	21.3	16.3	1.42
465	36.2	49.9	1.85
490	5.9	10.6	1.08
490	8.7	21.5	2.40
500	5.1	27.0	3.33
525	5.5	43.0	4.13
525	7.8	43.2	4.33

In another issue an editorial will discuss Santa Gertrudis.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments The information is interesting to our readers.

J. Morgan Clements is at Peking.

David T. Day is at the Palace hotel.

F. W. Bradley has returned from Idaho.

D. M. Riordan was in Shasta county last week.

Percy A. Robbins is living at the Claremont hotel, Berkeley.

E. H. Clausen, recently Captain of Engineers, has returned to Berkeley, California.

D'Arcy Weatherbe has been in China recently and is expected in San Francisco next week.

J. S. Bradford, manager for the Chiksan Gold Mining Co. in Korea, has returned to the mine.

Allen H. Rogers and **Sydney H. Ball** are examining the Ray Hercules copper mine in Arizona.

William J. Millard has received an honorable discharge from the Army and is now at Tulsa, Oklahoma.

F. C. French, who, as Major of the 79th Engineers, has been honorably discharged, is now at Salt Lake City.

E. P. Mathewson, **E. L. Doheny**, and **John C. Howard** are the new directors of the American Mining Congress.

C. W. Purington has opened an office at Vladivostok, as eastern director of the Far Eastern Development Co., Ltd.

Alex. M. Boyle and **Weldon B. Morris** have formed a partnership, as consulting engineers, with headquarters at Reno, Nevada.

Thomas F. Cole has resigned as president of the North Butte Mining Co., and is succeeded by **Robert Linton**, the first vice-president.

E. E. Barker has been transferred to the Morococha mines of the Cerro de Pasco Copper Corporation as superintendent of those properties.

The Colorado Scientific Society held its annual dinner on January 24 at the University Club, Denver. The officers for 1919 are: **Lewis B. Skinner**, president; **L. G. Carpenter**, first vice-president; **John B. Ekeley**, second vice-president; **Charles W. Henderson**, treasurer; and **Harry Wolf**, secretary. These, with **Marmaduke B. Hall** and **George O. Argall**, comprise the excutive committee.

The Montana Section of the A. I. M. E. held its sixth annual meeting at the Silver Bow Club at Butte, on February 7. At the technical session there were read two papers: 'The Metallurgy of Aluminum and Magnesium,' by **H. B. Pulsifer**, professor of metallurgy in the Montana State School of Mines; and 'The Manufacture of High Explosives and Their Use in Metal Mining,' by **J. C. Horgan**, of the Du Pont Powder Co. In the discussion on the relation of the engineering profession to public welfare, led by **C. D. Demond**, the Engineering Council and human engineering and co-operation were the principal topics.

Obituary

John T. Milliken, chemist, banker, railroad director, and mining and oil operator, died at his home at St. Louis on January 31, from pneumonia, at the age of 66 years. He was prominently connected with Cripple Creek mines, also in developing an old property near the Homestake in South Dakota.

THE METAL MARKET

METAL PRICES

San Francisco, February 4

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony, cents per pound	8.00
Copper electrolytic, cents per pound, in carload lots	22.00
Lead, pig, cents per pound	5.50— 6.50
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb	$95
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	18.00

EASTERN METAL MARKET

(By wire from New York)

February 4.—Copper is quiet. Lead is inactive and weak. Spelter is dull and lower.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1 01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1 01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, and on December 13 to 48 7/16 pence.

Copper miners' wages in Arizona are to be reduced to the old scale, or based on 20-cent metal. This will also apply to Montana and Utah. At the conference at Washington, the Secretary of Labor met 33 union delegates from the various copper centres.

The American Brass Co., the largest consumer of copper in America, made profits totaling $55,247,000 during the past six years. Dividends absorbed $17,325,000 of this. Depreciation and taxes accounted for a large sum, also $20,824,000 for improvements. The surplus stands at $21,447,000.

The U. S Shipping Board has fixed 1 cent per pound as the freight-rate on copper from the United States to Great Britain. This is a decrease from the recent rates of 3 and 4¾ cents. Normal rates are 0.17 cents.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery.

The A. S. & R. Co. reduced its price on lead last week from 5½ to 5¼ cents.

The president of the National Lead Co., E. J. Cornish, stated in Philadelphia recently that large quantities of lead were held by manufacturers having contracts with the Government. This surplus spot lead is the bear influence on the market. In a month, prices declined from 8 to 5½ cents per pound. The price of white lead must also drop accordingly.

Important lead-producing interests of the Coeur d'Alene region, Idaho, held a meeting at Spokane last week. Particulars are not available, but the matters discussed are said to have included the wage question and curtailment of production to meet market depression.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

ORES (New York)

Manganese Alloys: The market is devoid of any transactions and quotations are uncertain. As low as $185 and $200 is heard as asked for 80% ferro. There is an inquiry for several hundred tons of spiegel, which it is certain can be bought for not more than $60 per ton, delivered.

'Production of Ferro-Manganese in Blast-Furnaces' is the title of the U. S. Bureau of Mines War Minerals Investigation Series No. 5, by P. H. Royster. It consists of 31 pages, and tells how such furnaces are operated in making the alloy.

Molybdenum: A fair inquiry is reported, but no business has resulted. Quotations are nominal at 75c. to $1 per lb. of MoS_2 in 90% concentrates.

Tungsten: Some dealers report more inquiry, but as a whole the market is unchanged. Quotations are impossible [although $17 to $18 has been mentioned] in the face of an absence of testing prices. The output of tungsten ores in the United States in 1918 was about 5065 tons of 60% concentrates, according to the U. S. Geological Survey.

Eastern Metal Market

New York, January 29.

All the metal markets are waiting, and buying is only of a spasmodic character of small proportions.

Antimony is lifeless and unchanged.

Copper has sold as low as 20c. and perhaps 19c., but in small quantities.

Lead continues to fall with limited buying.

The tin market is absolutely dead and disorganized.

Zinc is weak, and demand is only to meet absolute needs.

ANTIMONY

The market is unchanged and stagnant. Wholesale lots for prompt and early delivery can be purchased at 7.50c., New York, duty paid.

COPPER

The entire market is a waiting one, and is marking time like nearly every branch of industry. Demand is of small proportions. Consumers are buying only what they absolutely need, and in view of the slackened pace of industry in general these needs are small. Copper has been sold in this limited scope as low as 20c. per lb., which we quote as the market. It is stated that it can be bought as low as 19c. for early delivery, but no sales under 20c. have been confirmed. As long as stocks of both crude and refined copper remain as large as they are, buying interest will continue small. There is also to be considered the large quantities of scrap copper which must be disposed of, some of it of good quality. Copper exports in December were about 20,000 tons. It is possible that complete Government reports may show the 1918 exports to be as large as the record outgo for 1917.

IRON AND STEEL

There have been no developments in the week, and the market is marking time. Domestic business is slow and export business is not developing promptly. Ship freights in competition with Great Britain are a handicap. An American mill has sold tin-plates to Japan in open competition. The British fixed price is $43 per ton higher than the Pittsburgh quotation, and a lower freight differential was all that was necessary to turn the order to the United States.

LEAD

There is little inquiry and the market is slow; it might be characterized as spotty. Demand is of such small proportions that it is not able to sustain the market and quotations have as a consequence fallen to 5.30c., New York, or 5c., St. Louis. There are more sellers than buyers and little business has been done. It is probable that this market is readjusting itself faster than any other, and that rock-bottom prices will be reached soon, if they have not already. The American Smelting & Refining Co. reduced its price to 5.50c., New York, last week, Tuesday, the 21st, and it still remains at this level.

TIN

Extreme dullness continues to pervade this market. There is absolutely no demand and conditions in general are chaotic. Consumers are still being importuned to absorb the large quantity of tin allocated to the United States Steel Products Co. for which they are expected to pay 72.50c. per lb., but they are generally assuming the attitude that they do not want to take any more of this metal than possible when they can buy for less. They realize that American tin can be bought in fair quantities at under 69c. and that, were imports permitted and the market free of control, the metal could be bought for shipment from the Far East at nearly 20c. per lb. less than the controlled price. Efforts to induce the babbitt and solder manufacturers to absorb their share of the allocated tin are understood to have failed last week. There are also rumors that the operations and sales of the American tin smelters are to be restricted. Tin arrivals to date in January have been 2375 tons, all through Pacific ports.

ZINC

The zinc market continues to drag and prices to fall. Demand is of the hand-to-mouth character, consumers buying only what they must and for early delivery at that. None are purchasing into the future. Prime Western for early delivery is quoted at 6.75c., St. Louis, or 7.10c., New York, with March and April positions 10 to 15 points under this level. It is claimed by some that 6.75c., St. Louis, is under the present cost of production.

LEAD NOTES

A year or more may elapse before mining and other conditions return to a pre-war level, or some level above it, is the belief of F. W. Bradley, president of the Bunker Hill & Sullivan Mining & Concentrating Co., at Kellogg, Idaho, recently interviewed at Spokane, Washington, by the 'Spokesman-Review'. The leveling may be gradual, as conditions are ironed out, but an improvement is expected in the meantime. Too much of a shock would be suffered in an abrupt flattening to a pre-war level, although it would not be unwelcome to the gold miner.

He said that "the lead market is unstable and inactive, and but for the silver in its ore the Bunker Hill & Sullivan would be in bad shape. If a property operated under these conditions was owned by an individual or two it would be a policy of business to shut it down and wait for better conditions, but the condition is different with a great many stockholders and a community that is dependent upon its operations. At Kellogg we have a community that has stood by us and did not run off to the shipyards, so it is no more than fair that we should stand by it now. We are up against a condition. The question of wages is not involved in the situation, because the cost of living is as much above the pre-war condition as the wages, so far as the married man is concerned. Of course the single man is far ahead on the increase. There has been no profiteering by the local merchants. The increase has not come from them. They are paying a higher price for goods than they have raised the price to the consumer. If there is any profiteering at all on foods it is behind the wholesalers and jobbers. Railroad rates have eaten deeply into the cost of lead. The price of lead today is below the average of the last 11 years. Railroad rates are up, and it looks as if they would have to be put up again. Railroad rates have been material in raising costs, and it doesn't seem as if there was to be any relief from that source. The shipper has already stood for a 25% increase and other burdens, including sidings. This means that for several years some things will be higher than before the War. We will re-employ all of our soldiers, of whom 238 are on the honor-roll at Kellogg. Room will be made for them by letting go those who proved inefficient. The lead we produced in December, when the market failed, is stored, but our current production is moving to consumers, including automobile and tire manufacturers, locomotive works, and paint manufacturers. All consumers are taking some. We are completing and co-ordinating the different parts of the smelter so that it will have a capacity of 200 tons of lead by the middle of this year. More depth is being attained in the mine. This has necessitated the establishment of additional hoisting, pumping, and ventilating machinery, by which our operation cost is increased."

EDITORIAL

FOREIGN loans in the United States on January 1 are given, by the Guaranty Trust Company of New York, as $9,483,327,330, and even this does not include subscriptions to foreign internal loans, with the exception of the French fives of 1931 and the Russian five and a halfs of 1926.

SOME of our friends, led by that indefatigable propagandist for simplefyde spellin, Mr. W. H. Shockley, are bombarding the Secretary of the Institute with requests to introduce sundry unpleasant and unnecessary changes in the style of spelling used in the bulletins and transactions, despite the fact that the Committee on Papers and Publications has declined to make them. We hope that the members of the Institute will be slow to support these efforts to disfigure our language in the manner of the 'Bad Boy's Diary' and that they will leave such matters to the Committee on Publications, which is thoroughly representative and quite competent to act in the best interests of our official language.

SEVERAL interesting mining transactions concluded recently appear to indicate a revival of initiative. For example, the old Idaho-Maryland mines have been consolidated with the Union Hill group in the name of the Gold Point Consolidated Mines by Mr. Bulkeley Wells and his associates, who include such well-known men as Messrs. Errol MacBoyle, Rufus Thayer, F. W. McNear, John McCrossen, Roy H. Elliott, and Edwin Letts Oliver. The venture should prove a good one, for it is in the hands of capable men and is based upon a promising portion of one of the best gold-mining districts in the West. Another promising consolidation has been completed in the Rochester district of Nevada, where the five important properties—the Rochester Mines, Rochester Combined Mines, Nenzel Crown Point, Elda Fina, and Rochester Merger—have been united in order to terminate litigation both pending and threatened. The papers were signed at Reno on February 3 by the principals, Messrs. L. A. Friedman, H. G. Humphrey, and Joseph Nenzel. Two of the mines in the consolidation—the two first mentioned—own well equipped mills, capable of treating a total of 500 tons per day. From Goldfield comes the news that the old—in our Western sense—Goldfield Consolidated Mines, credited with a production of $70,000,000 since 1905, has passed into the hands of a new corporation to be known as the Goldfield Mining Company, organized by Mr. H. G. MacMahon, of Goldfield, who is associated with a group of experienced Californian and Nevadan operators. Some of the property is taken over by purchase and the remainder is leased for a period of five years. It is the intention of the new controllers to establish a new system of leases, enabling large areas of the property to be re-exploited and re-developed. Many applications for leases indicate a general renewal of activity.

AMERICAN rights in Mexico are to be amply safeguarded by the Mexican government, says our Ambassador to Carranza's court. This is interesting, as also is the further declaration by Mr. Henry P. Fletcher that the feeling toward this country has become more friendly since Von Eckhardt, the German minister, was recalled. Evidently the latter was a person of large 'influenza' in Mexico. We are further informed that President Carranza "has accomplished a great work in preparing for development and reconstruction, and has made such headway that the various bandit leaders are now without real influence." Another press dispatch asserts that President Carranza intends to call a special session for the purpose, among others, of legislation devised to protect American oil-holdings in Mexico, and it is hoped that "ultimately" a law will be passed recognizing title to oil-lands acquired by American citizens in good faith in accordance with the laws of the country, this being done without trespassing upon "the sovereign rights of Mexico in respect of taxation and regulation of property." Now comes the milk in the cocoanut, the nigger in the woodpile, and the fly in the amber. Señor Carranza has no intention of appealing to the Peace Conference at Versailles; he is opposed to "any foreign meddling in the adjustment of Mexico's internal affairs." He sees the shadow of a portentous event. Finally, it is stated that the Mexican government is "contemplating steps looking to a refunding of the public debt and might in the near future send a representative to the United States to study the possibility of making financial adjustments." In short, Don Venus is about to 'touch' Uncle Sam, and prepares for that delicate operation by being good. So much the better; we are just as anxious as Señor Carranza to see the Mexican house put in order and the ground cleared for peaceful industry, including mining.

A Victory of Americanization at Seattle.

Bolshevism reached out a feeler to try the firmness of that true democracy which is the United States. It chose a city rich, flourishing, notable as a great port, a stopping place on one of the principal highways of international trade, and yet detached from the crowded centres of American life. The leaders hoped that measures of suppression at such a place would be less vigorous, because there would be a less insistent call from neighboring communities to extinguish the threatening flame of anarchy. The point was well chosen; Seattle afforded strategic advantages for an experiment in substituting the principle of the soviet for the administration of justice by a representative government. Had insubordination desolated Seattle, had civil strife developed there into a human horror, the evil of Bolshevism might have spread in the United States, as the friends of Trotsky, Lenine, Hindenburg, and Bernstorff desired. The attempt has failed and Americanism has stood the test. Seattle deserves honor of the country. Her people did not lose their heads; they did not trifle with a grave danger; they and their Mayor, Mr. Ole Hanson, and the Citizens' Committee, headed by Mr. A. J. Rhodes, cowed the bullies by simple manhood, resorting to no foolish display of futile bulldozing by the police, nor seeking to come to a compromise with the instigators of disorder. They branded the 'general strike' as "revolution" and issued a statement that, unless the strikers should yield by a certain date and hour, they would face the power of the United States Army. Mr. Hanson knew how to employ the forceful persuasion of an ultimatum so that the would-be Bolshevists recognized that he had in truth given them his last word. Democracy, sanity, the government of the people, by the people and for the people, has been vindicated at Seattle. Through this the winning of world-peace has been made still more sure.

Already we see how the disturbing I. W. W. organization has weakened at Butte. An outbreak was ripe to follow any symptom of success by the Bolshevists at Seattle, and the flames might then have run like fire in dry grass. No one denies that many workers in America have some cause for complaint. So have they in England. The collapse of stimulated and special industry, without pre-arranged plans for financial re-adjustment, necessarily has reduced production, and that has thrown numbers of men out of employment. Business men are doing all they can to rehabilitate industry and lessen the burdens of the people. The copper companies have undertaken to do a gracious thing in this direction that must win wide approval. Despite the fact that copper is a drug on the market, that no important European demand has appeared, that nearly the whole of the present output must go into storage, the operation of the mines is being continued on as slightly reduced a basis as possible, and with wages cut only in accordance with the sliding scale upon which they had been advanced during the period of high prices. This is a service to humanity, and it is to be hoped that the workers will appreciate the financial sacrifice entailed by such action. It means that the millions paid as wages, which stand between the miner and destitution in the hard months of winter, are largely borrowed millions on which the producers are paying interest at six per cent, while the copper itself that has been produced is costing money for storage each day that it lies unsold. It cannot be said that this yields a wholly compensating benefit to the corporations. Every intelligent man knows that it is uneconomical to close a mine and to suffer an organization to become disintegrated, but there is a limit to this, for the workers themselves realize that the value of an organization lies in the efficient nucleus. Operations may be trimmed very close to that nucleus before serious damage is involved either for the mine, the smelting plant, or the refinery. The copper companies have not cut their forces anywhere near to the narrow limit of that skilled and capable minimum. They are serving the people in a way that deserves the loyal recognition they are receiving from sensible workingmen who are declining to follow the red agitators whose maniac voice would lead into the valley of disaster, hideous with murder and famine. It must not be overlooked that the victory of good sense at Seattle was the fruit of conservative thought among the workers themselves. Hesitant in the face of the possible subversion of law and order, fearing to be exposed to the vengeance of a momentarily dominant mob, which brings swifter violence upon the non-conformist laboring man than upon his employer, this large body of rational men only needed a strong leader. The heart of the people is always sound; the excesses of the multitude grow out of infection from masses wrongly led. The plain people, rightly generalled, stand on the side of law and order. This has been proved again at Seattle.

The Bolshevists, alien in spirit and mind, may as well give up their hope of corrupting the sound principles of democracy in America. This country is not yet ready to abandon its high ideals of government or the high standard of living that gives opportunity to save against the stringencies of old age and to push forward the children of each generation to larger achievement. America is not disposed to plunge into the abyss with disordered Russia, nor to clamor against the bewildering financial difficulties of reconstruction as an injustice to be resisted by destroying industry. Troubled employers of labor, trying to find their way back to normal business, need the trusting co-operation of labor, just as labor needs the guidance of the managers of industry, in order that all concerned may be saved from hardship and suffering. Mr. Samuel Gompers has said wisely that all must pull together, and that employers should organize to meet organized labor, so as to eliminate cut-throat competition and to stabilize industry. After the failure of the demons of destruction in their attempt at Seattle, we may look forward confidently to constructive efforts between workers and employers. There must now be an end to disorder, and a turning more determinedly than ever to that hearty co-operation of all Americans which is the glory of our democracy. In that spirit we won the War, and in the same spirit will we establish peace.

A Post-Mortem

Prolongation of the life of a mining enterprise by purchase of new property has become an acceptable method of company finance. When, in 1910, the Camp Bird mine, in Colorado, showed signs of approaching exhaustion, the English company, which had acquired it ten years earlier from the late Thomas F. Walsh, bought the control of the Santa Gertrudis mine, at Pachuca, in Mexico. When the Santa Gertrudis, in turn, began to exhibit loss of vitality, the company decided to acquire rights to the El Bordo group, also in the Pachuca district. This transaction was closed recently. It is estimated that the El Bordo has an assured reserve of 253,000 tons of ore, from which a profit of $2,142,000 is anticipated. The report was made by Mr. Hugh Rose, the manager of the Santa Gertrudis. In this case, we believe, the company did not have to pay a large commission to its own engineers, as it did in the Santa Gertrudis deal, from which Mr. J. Hays Hammond, who was then consulting engineer to the Camp Bird company, drew a commission of $600,000—cut down from an original demand for $1,000,000. Indeed the directors themselves, except Mr. W. F. Fisher, all drew profits from underwriting and trading of various kinds. It is a marvel that the British public took these proceedings so tamely after the chairman, Mr. Arthur M. Grenfell, had gone bankrupt and had involved the Camp Bird and other companies in difficulties. That was in the early part of 1914. It is interesting now to make a post-mortem inquiry into the Santa Gertrudis business, if it be not brutal to conduct an autopsy upon an enterprise that is still alive. According to the latest report of the subsidiary company operating the Santa Gertrudis, the ore in reserve amounts to 880,433 tons, from which a profit of $3,750,000 is expected. The mine has yielded dividends aggregating £731,250 on a capital of £1,500,000, of which the Camp Bird company owns 81%. If we place 81% of the estimated remaining profit to the credit of that company and add 81% to the dividends distributed, we get the sum of just about $6,000,000 as the realizable money to be obtained by the Camp Bird company on the operation. On the other side, the Camp Bird company paid £922,131, or $4,481,550, for the 81% interest. Thus the principal will be returned plus about 25%. A silver mine should pay at least 10% per annum to warrant the risk incurred; in eight years the company should have received 80%; it will take three years more to exhaust the ore resources; thus 30% more is needed. The mine should have yielded at the end of 11 years at least twice the amount of money paid for it, that is 200%, instead of 125%, disregarding the refinements of amortization. It was expected to do much more than it has done. The estimate, at the time of flotation, stated that the ore in reserve amounted to 1,150,000 tons, from which a profit of £1,650,000, or $7,019,000, was assured, with undefined prospects of finding more ore and winning more profit. Evidently the mine will yield the amount of profit estimated as being assured when it was acquired, but no more. In short, the expectation of favorable development in depth has not been fulfilled. It was likely to be falsified by reason of the conditions under which the mine was appraised. An appraisal that will stand the test of time is unlikely when the engineers reporting upon a mine are participating heavily in the promotion profits. Even honorable men are biased by self-interest. It is true, the working of the Santa Gertrudis has been impeded by the revolutions in Mexico, but that has prolonged its life and postponed the closing of the account with the submissive shareholders. Moreover, silver stood at 51 cents per ounce in 1910, when the mine was acquired, and the price of the metal is now nearly twice as much. Experience teaches; we need more post-mortems of this kind to guide and warn speculators against paying excessive prices for mines and overburdening them with the undue profits of promotion.

A Mining Geologist

In these days when we review, with sadness and affection, the career of Dr. Raymond and go back to the beginning of scientific mineral exploration in this country, it is brought home to us how recent has been the use of geology as an economic instrument of industry. In the days of the founders of geology, of such men as Lyell and Murchison, for example, the study of geology was an amateur's hobby, which feared the taint of commercialism and deemed itself gentlemanly so long as it abstained from helping people to make money. We have traveled far from that aristocratic idea; we cherish the democratic ideal of using geology, as any other science, for furthering the welfare of man; we have discarded the old-fashioned notion that any science loses caste by becoming utilitarian. In this country Clarence King and his comrades led the way by their work in the Fortieth Parallel exploration and by founding the U. S. Geological Survey in 1879. At that time the geologist was retained by the Federal Government for the purpose of guiding the development of the national mineral domain, but he had not yet become a distinctly professional man with a regular practice among private clients. That phase of geologic study did not ensue until the beneficial consequences of official examinations and reports became manifest in the actual search for ore on the surface and underground. As soon as this fact was appreciated the enterprising owner of mines, whether an individual or a company, turned to the geologist as a regular consultant. Thus a new specialist was evolved. We publish an interview with an honored representative of this branch of the mining profession, for he belongs more to the practical side than to the scientific, or, rather, he is a successful compound, having learned that the object of mining is to make money and not to prove or disprove hypotheses, while yet retaining a genuine love for scientific research. We are glad to publish the interview with Mr. Horace V.

Winchell because he is a distinctly American product, both as an individual and as an example of the type of geologist that has done so much for the systematic exploration of our mineral resources. He comes of a family of geologists and illustrates the technical evolution to which we have referred, both his father and uncle having been professors of geology and State geologists, so that in his family we see the progression from the academic to the official geologist, and from the latter to the practitioner. He was lucky in being born in an atmosphere so favorable to the incubation of the talent for which a demand was developing in the mining world. As a boy he showed a thirst for exact, as distinguished from vague, information. He determined early to become not an academic geologist but a practitioner, and he told his chum, Mr. John A. Blair, of this ambition. In 1887, when only 22 years old, while assistant State Geologist of Minnesota, he told Mr. Blair that he had ascertained the existence of an enormous iron deposit on the Mesabi range. As he says, it was "the practical side of geology" that attracted him from the start, when he was fortunate in serving his apprenticeship with two such capable field-geologists as the brothers N. H. and Alexander Winchell. Almost at the beginning of his career Mr. Winchell scored both a scientific and an economic success. He suggested the now accepted explanation for the origin of the Lake Superior iron ores and he predicted the future tremendous importance of the Mesabi range as a source of iron ore. In the treatment he received from the U. S. Geological Survey he was by no means unique; unfortunately the reputation of the Survey for generosity in giving credit to the mining engineers and unofficial geologists who have done pioneer work is quite in accord with the Mesabi story. We are in entire sympathy with Mr. Winchell in the criticism that he implies. Besides his auspicious start as a mining geologist, Mr. Winchell was fortunate in acquiring early in life an ability to write on his subject. To the articles that he wrote for sundry technical periodicals and transactions he owes his capacity for clear exposition, a capacity that he was enabled to put to profitable and honorable use when serving as an expert witness in mining litigation, a branch of mining geology in which he has earned a reputation second to none. His success in this work was due mainly to his thorough preparation as a geologist, in his grasp of the points involved, and in his direct application of scientific theory. The splendid library that he established in his office at Butte, as a part of the organization of a geological department for the Amalgamated Copper Company, enabled him to acquire an unrivaled command of information. At the same time he developed a system of underground maps, useful not only for litigation but for finding ore, which, it must be insisted, is the primary purpose of mining geology. He succeeded in that as he did in the courts of law. His name is linked with the discovery of the genetic principle we call secondary enrichment. Here again the geologists of the Survey took to themselves the lion's share of credit, mainly because Mr. Winchell's lips were sealed by the exigencies of a fierce litigation at Butte, so that he could not burst into print at the time when the gentlemen at Washington were thriling the mining profession with their inductions and deductions. In later years Mr. Winchell came before the public as a protestant against the cancellation of the Cunningham coal-claims in Alaska, an enterprise in which he personally was interested and the killing of which, by an arbitrary act of the Government, aroused his bitter resentment. He made a plucky fight, in which he took with him the sympathy of many. The incident served to accentuate his dislike of the mining law and the administration of it. He led a powerful propaganda for the amendment of the regulations controlling the exploitation of the public domain and he consistently attacked the manifest defects of the so-called apex law. In these and other matters he has proved himself a fearless leader of men and a citizen of unquestioned public spirit. In him the mining profession, usually so inarticulate, has found an effective spokesman. It is not surprising therefore that he has recently been elected the president of the American Institute of Mining Engineers, an honor that he has earned and a position for which he is well fitted. The present writer has found himself in disagreement with Mr. Winchell more than once, as is likely between men so ready to express positive opinions, but we recognize not only the possibility of his being right and of our being wrong, but, what is more important, the sincerity of his purpose and the highmindedness of his motives. In the interview he outlines what he deems to be the main function of the Institute, namely, service to the profession. We feel sure that during his term of office he will further that concept and do something noteworthy in enabling the profession to play its proper part in the era of reconstruction bequeathed by the War. As for the more personal aspects of Mr. Winchell's character, we know several kind stories, of which the most memorable is that of a former partner, who testifies to his generosity in the early days of their practice at Minneapolis. The partner—it was Mr. F. F. Sharpless—did the assaying of iron ores while Mr. Winchell did the field-work. After the panic of 1893 the assay business went to pieces and prospects were black. Mr. Winchell made a sale of some iron-land, a deal entirely outside the partnership, and telegraphed to his discouraged associate that he was credited with a half-share of the commission. Blessed is the man with such a partner. Another friend tells us that he was a serious boy, whose chief enthusiasm was for music. Another likes to remember how this taste for music was manifested during the litigation at Butte when Mr. Winchell added to the jollity of the evening by singing 'Dunderberg's Sausage Machine', a song suggesting that his boyhood seriousness was not invincible. He has left a bright trail of good-fellowship and warmheartedness wherever he has been, and that means much of the map; he has proved himself not only an untiring investigator and an exact thinker but a cheery companion and a loyal friend—in other words, a highly civilized man. We wish him every success in his year of office as the standard-bearer of the mining profession.

The M. & M. Society and the Merger

The Editor:

Sir—On December 21 an interesting editorial appeared in your paper concerning the suggestion that the Mining & Metallurgical Society of America merge with the American Institute of Mining Engineers. The general tone of the article is apt to cause a misconception regarding the Mining & Metallurgical Society, its functions, and its scope of action under the law. The Society has wide rights, including that of expressing its opinion as a body on all matters of public as well as private interest—a much valued and important privilege.

One particular point which it is well to call attention to at the present time refers to such privileges and is represented by the following sentence in your article:

"Another difference, namely, the constitutional provision prohibiting the Institute from taking part in the discussion of public affairs, was removed five years ago."

This statement is inaccurate.

The Institute is incorporated under the general law of the State of New York which sanctions such organizations and permits to them a wide scope of activity, unless the incorporators choose to limit their activity in their certificate of incorporation, which is the underlying and life-giving document to all such organizations. That the Institute recognized these limitations is clear from the fact that it was thought to abrogate them by amending the Constitution so as to permit expression of opinion on public questions by the membership as a body.

The certificate of incorporation of the Institute does so limit the activities of the association, where in paragraph five it reads:

"That the purposes for which this corporation is to be formed are: To promote the arts and sciences connected with the economic production of the useful minerals and metals and the welfare of those employed in these industries by means of meetings for social intercourse and the reading and discussion of professional papers, and to circulate by means of publications among its members the information thus obtained; and to establish and maintain a place of meeting for its members and a hall for the reading of papers and delivery of addresses, and a library of books relating to subjects cognate to the sciences and arts of mining and metallurgy."

This is the only authoritative definition of the purposes of the Institute: it distinctly sets forth what these purposes are; and for that reason the functions of the organization are limited. Under this certificate of incorporation it has consequently no right as a body to take part in the public discussion of affairs as is erroneously stated in the editorial mentioned above. Not having the right to discuss public affairs, because of the limitation of powers fixed in these articles of incorporation, it cannot of course legally acquire such right by changing its constitution alone, a document deriving its own powers and value from the certificate of incorporation, nor can it validly, through any of its representatives, exercise such a right until such time as it may have modified its articles of incorporation which govern both its constitution and its by-laws. Unless consequently the Mining & Metallurgical Society of America is disposed to forego the unquestioned right of public expression of its opinion, it seems ill advised that it join the American Institute of Mining Engineers, whose right to such expression of opinion, to say the least, is very obscure.

There has been so much loose thinking and so much verbiage during the War that it would seem advisable to try and relieve misconceptions and false understandings regarding important matters in the difficult times now approaching. It is for this reason we are taking the liberty of addressing this argument to your paper in the hopes that it may go far toward correcting an erroneous impression which surely was conveyed entirely inadvertently.

Wheat and Chromite

The Editor:

Sir—To watch our Government shoulder a billion dollar loss and refuse to fairly meet a moral responsibility one one million dollars is quite interesting, to say the least. Such, however, appears to be the outcome of the relationship of the Government to the wheat-raiser and the chrome-producer. Both wheat and chromite were of vital importance in winning the War. Production of each was stimulated by higher prices and encouraged by our Government by solicitation, appeals to patriotism, and constant urging.

Increase in domestic production was necessary for the same reason: lack of shipping facilities in each instance. Both could have been obtained in foreign countries: wheat from Australasia and India, chrome from New Caledonia and Rhodesia. No one should say the miner is less patriotic than the farmer. Both the miner and the farmer expected, or expects, to profit by his endeavors. Who then will tell why one should be guaranteed a large profit and the other entail a comparatively great loss?

Government reports show the fall-wheat crop to be promising a good yield. The outlook for a large acreage of spring wheat is evident. All of which is excellent. But why the Government should pay $2.26 per bushel for wheat when it can be brought to our door for $1 to $1.25 per bushel and will no doubt be sold to the Government for the latter figures—meaning a loss of a billion dollars or more—can only be answered in one way, namely, to keep faith with the domestic producer. This is only paying the farmer what he justly deserves, as he has founded his production and figured his venture on a promise made by the most reliable of governments.

Government reports will also show that there is and was ample chromite available in our country to meet the demands necessary to successfully prosecute the War. No one conversant with the reports of the consumers of chrome ore as to amounts on hand and with the quantities now opened up and available in 1918 and still awaiting a market can dispute the ability of the domestic producer to meet all requirements placed upon him. Nevertheless branches of our Government at Washington permitted foreign ore to be brought to our ports and unloaded, through issuing illicit licenses and against orders which, if they had been obeyed, would have given the domestic producer of chromite a market for all he could have produced during the year 1918 at least. Statistics show this conclusively. What is the result? The domestic producer of chromite found himself last fall with ore on hand and opened up, properties just made available for production by building roads and installing machinery at mines and mills, and no market in sight. A large majority of the producers have lost money and some a snug fortune owing to this condition.

It has been reliably estimated that one million dollars will cover the loss of the chromite producer. This is but one-thousandth part of the billion dollars the country will lose in buying the entire wheat crop next fall at $2.26 per bushel. It seems reasonable then that the chromite-producer should expect to be taken care of to the extent of at least getting even, when the wheat-raiser will not only get even but make hundreds of millions of dollars. Each industry needed stimulation and a resultant increase of production in order that we be assured of winning the War. We got the assurance and have the increased production and why not pay the [illegible] and back up the moral obligations and promises now the War is won?

We are seriously considering cancelling the indebtedness of our Allies, which is over eight and one-half billions of dollars. If we can do that much for our Allies we should be able to reimburse our own patriots to the extent of the existing moral obligation now so generally admitted. There are many ways to do this which can be successfully worked out during this term of Congress. Our legislative servants should be importuned till the chromite-producer is assured recompense for capital properly invested and prudently managed.

Much has been accomplished in ascertaining where the responsibility rests for the condition of the chromite patriot. This is gratifying but not sufficient. From a world-wide economic standpoint, perhaps, it is just that the foreign ore now take the place of our domestic ore, inasmuch as it can be produced much cheaper. This does not lessen the responsibility of our Government in taking care of a dead war-baby and giving it fit and proper interment.

GEO. S. BARTON.

Grants Pass, Oregon, January 31.

The Future of Copper

The Editor:

Sir—Copper is under strong discussion at the present time. With the demand and consumption of two billion and a half pounds per year and increasing at the rate of 7% per annum—which increase will most likely be larger in the future—is there not the possibility that we will be strong importers of copper in twenty years instead of an exporter, and are we not selling something that later we will have to buy back at an advanced price? This country with its immense resources and stability will increase in foreign population in the next few years as never before. My opinion is that the copper people of this country are making a mistake in selling so much copper to foreign countries, especially at a price less than copper can be imported into this country at a later date.

ALEX. F. ESKE.

Oakland, California, January 26.

[Our correspondent's fears are, we think, unfounded. The copper resources of this country are not within sight of exhaustion; moreover, those owning the deposits of copper ore are desirous of turning them into money, which is the prime purpose of mining, while the market is favorable. It must be remembered that a substitute for copper, such as cheap aluminum, may spoil the demand that now obtains. The miner cares little for posterity.—EDITOR.]

Copper Production in Mexico

The Editor:

Sir—Referring to 'Copper Production in Mexico' in your issue of December 21, 1918, I note that statement is made that production of copper in Nuevo Leon for 1917 was 31,089,484 kilo. This must, of course, refer to the amount smelted in Nuevo Leon, as the mines of that State could not have produced any such amount. The table for production of copper in the 'Boletin Minero' would appear to me to have some inaccuracies. From the list given therein I must infer that only smelter production is intended to be made, and if that be the case in one instance at least there must be an error. The smelters that were operating in the States mentioned were as follows:

Aguascalientes—American Smelting & Refining Co.

Baja California—Compagnie du Boleo.

Coahuila—American Metal Co., at Torreon; and Mazapil Copper Co., at Saltillo.

Nuevo Leon—American Smelting & Refining Co., at Monterrey; Monterrey Mining, Smelting & Refining Co., at Monterrey; and American Metal Co., at Villaldama.

Sonora—Cananea Con. Copper Co.

San Luis Potosi—American Smelting & Refining Co., at Matehuala; and Cia. Metalurgica Mexicana, at San Luis Potosi.

Zacatecas—Mazapil Copper Co., at Concepcion del Oro.

The production for Coahuila at the Torreon and Saltillo plants was probably not great, as most of the ore smelted was lead ore. Only the copper collected in matte at Saltillo would have been produced from that smelter. The actual production of copper from Coahuila mines was probably not much greater than 300,000 kilogrammes.

Copper produced in Nuevo Leon smelters was almost entirely from mines outside that State. All of the plants mentioned are principally lead smelters, although a small tonnage of copper ore was treated at the Monterrey plant of the A. S. & R.

Presumably the ore exported from the Moctezuma Copper property at Nacozari was included in the production for Sonora.

The San Luis Potosi smelters must have produced much in excess of 565,000 kg. of copper. Possibly matte shipped from one smelter to another for converting in a different State was not included. It is probable that the copper produced from one mine alone in San Luis Potosi was four times as great as that noted in the table, and this was smelted in one of the smelters of that State.

Charcas, S. L. P., January 11.

Water Laws of Nevada

The Editor:

Sir—In your issue of January 25 there is a letter by Mr. R. T. Walker in reply to a letter by Mr. G. A. Duncan published in your issue of December 21 under the caption of 'Water Laws of Nevada'. These letters pertain to the laws governing the ownership of subterranean water in the arid mining regions, a topic of great importance to the mining industry.

Preliminary to being one of the witnesses who testified concerning the water-governing conditions in Eldorado canyon, in the trial of the case cited by Mr. Duncan, it was necessary for me to make a thorough study of the region involved, and I deem this subject of sufficient general importance to warrant my asking a portion of your space for an effort to clear a simple palpable regional structure enforcing a watercourse in Eldorado canyon, from the intricacies and beclouding elaboration enshrouding it in Mr. Walker's article; and for the reason that the mining district and trial used by Mr. Duncan as an illustration furnish marked examples of the possibility of unrighteous judgment under the construction of the laws as advocated by Mr. Walker.

Your editorial of December 21 wisely recognizes the fact that, as to water-rights, "the courts have yet to adjudicate in special cases." Mr. Walker's proposition to dispose of the whole question by limiting water-ownership between "vertical planes passing through the surface boundaries of the mining claims" is as impossible of application as it is opposed to equity and the decisions of the higher courts.

Mr. Walker claims that all the water of Eldorado canyon is contained in a network of fractures, and that the water in question is percolating water, and for that reason not subject to appropriation under Nevada laws, and he makes the general statement that underground waters cannot be said to flow in any given direction.

All students of hydrology agree that, as a rule, groundwater conforms to the topography, and that there is a more or less constant movement of this ground-water from the higher to the lower elevations, finding outlet frequently in springs in depressions or formation fractures. This movement takes place in so-called trunk channels fed by many tributaries, as in the case of surface streams. These tributaries, coming in from both sides of the trunk channel, form part of the watercourse, and would be so treated in disputes arising over surface-flowing streams. The water of a given region, flowing underground or contained within the rocks, gravitates toward the section of lowest altitude for that region. This is not alone true of the surface run-off, but of the ground-water as well, as is clearly shown by C. R. Van Hise, whose work on underground flowage is regarded as authoritative.

Eldorado canyon is the lowest or deepest canyon in its vicinity, and toward it all water accumulations in the rocks on either side will gravitate, particularly as these rocks stand high above the bottom of the canyon on either side. Eldorado canyon is marked for its entire length by a strong porphyry dike of exceptional alignment and almost unbroken continuity, a condition giving rise not only to the canyon itself, but to the water-bearing fracture referred to by Mr. Walker, which fracture is fed chiefly by the great mass of water-bearing 'malpais' along the summit of the river range, and, to a lesser degree, by the meeting under the canyon-floor of the water conducted there from either side, and the water of the region flows within this channel down the canyon into the Colorado river, at its mouth maintaining, in times of low water, a small area of clear water in the surrounding muddy water of the river.

We have here all the simple palpable features of a stream. The direction and movement of this water and the channel conducting it are alike obvious. Water movement in any other direction would encounter the resistance of a constantly increasing head. As water cannot flow toward its pressure-head, but must flow away from it, the water in the region in question must flow toward the axis of Eldorado canyon. The many shafts, cross-cuts, tunnels, and drifts on both sides of Eldorado canyon demonstrate an almost complete absence of water from the rocks, the rainfall not resting there but quickly finding its way to the natural drainage channel of the region, as is the case with surface-stream maintenance.

The above conditions, all plainly open to observation, of common knowledge in the region, and easy of comprehension from testimony, unquestionably establish Eldorado canyon and its accompanying dike-fracture as a watercourse whose boundaries and direction of flow can be determined.

Mr. Walker advances the idea that cross-faults necessarily cut off underground water-flow. This statement is in error; as faults, or even dikes crossing a master regional line of weakness are generally subject to fracture by frequent movements along the greater fault. A fault might divert the water for a distance, just as would a dam in a stream, but the flow would continue where some movement had opened a way, and again seek its old channel. Mr. Walker's naive theory of a network of fractures, if applied in this instance, would scarcely comport with his claim of interruptions of flow by cross-faults.

The fault mentioned by Mr. Walker, in which he sank his shaft, is merely a tributary to the main trunk channel in the canyon. The water-shaft was sunk at the junction of the fault with the main channel of the canyon and may owe much of its water to the main channel supply, but such water as the shaft operations exhaust from the fault constitutes a diversion of appropriated water from its normal channel in the same way that water taken from the tributary of a surface stream would, if permanently diverted, affect the flow of the main channel.

It is certainly highly significant that for almost the entire water-supply needed by Mr. Walker, even for domestic use, he found it necessary to leave his own gulch and go a mile and a half over the mountain into Eldorado canyon, and to the dike in the canyon-bottom to get his supply. Certainly, if his theory that a network of fractures induces a general percolation of water in the region is valid, a well sunk anywhere in that vicinity should have found water.

The structural features of Eldorado canyon not only establish beyond a reasonable doubt the fact of a well-defined subterranean watercourse along its dike-fracture, in which water is always found, but positive proof is added by the universal dryness of the many shafts and tunnels in Eldorado canyon on both sides of this main trunk channel.

The water flowing in this channel was granted to the plaintiff mentioned by filing and appropriation under the laws of Nevada, his priority and clearness of title being beyond question. Upon the basis of the possession of this water an excellent mill was built, and mining and milling operations successfully entered upon, only to be presently stopped by the diversion of the water-supply. A great wrong has been done here, and there has been established a dangerous precedent, in the confirmation by the Court of the diversion of that appropriated and beneficially used water from its natural channel.

May not these wrongs be perpetrated otherwhere in Nevada?

Evidently there is need of the correction of Nevada water laws, or of their interpretation.

EDWARD W. BROOKS.

Los Angeles, February 1.

Rossiter W. Raymond

The Editor:

Sir—Having read with interest your editorial comments on the life and achievements of Dr. R. W. Raymond, I take the liberty of sending you this brief communication, hoping that it will be of some interest to those who knew him, and they are many.

I was associated with him, in the years 1870 and '71, in editing the 'Engineering & Mining Journal' in New York, and went with him to Wilkes-Barre to attend a meeting of engineers which had been called with a view to forming an association of men whose chief interests were in mining and metallurgy. Our first meeting was held in the office of Richard P. Rothwell in that city.

Your tribute to Raymond is accurate and well-founded, and I fully agree with your judgment of his merits and abilities. I would, however, call your attention to one inaccuracy. His father was not Henry J. Raymond, the founder, and for many years, editor of the New York 'Times', but Dr. Robert R. Raymond, president of the Packer Institute in Brooklyn, a fine courteous old gentleman whom I frequently met.

For some years past Dr. Raymond, Dr. H. S. Drinker, and I were the only survivors of the founders of the A. I. M. E., and now the number is reduced to two. The second meeting was held at Bethlehem, Pennsylvania, at which so many new members were taken in that the success of the Institute was assured, especially as a large number of these came from all over the country, whereas the original members, with the exceptions I have mentioned, and of J. H. Bramwell, were all, as I remember it, connected with the anthracite mining in Pennsylvania. Anton Eilers and Dr. Thomas M. Drown, who was for many years Secretary, were among the new members. Martin Coryell was the first secretary, Drown the second, and he was succeeded by Raymond, in the most important office of the Institute, and it is largely to them that its success is due.

WILLARD P. WARD.

Savannah, Georgia, January 30.

[We were wrong, as Mr. Ward says, about Dr. Raymond's father; he was editor of the 'Free Democrat' and the 'Evening Chronicle', at Syracuse, New York, from 1852 to 1854. We are glad to publish Mr. Ward's letter and invite other reminiscences of Dr. Raymond for publication.—EDITOR.]

THE 'Times of India' on hoarding bullion says "India should not expect a full arbitration in bullion at present, because, owing to the War, gold and silver are not parted with by the leading nations of the world. * * * Gold and silver lying in the houses of our farmers have no economic value, and it only obstructs the financial growth of India and cripples its money power."

THE efficiency of graphite crucibles is expressed as so many heats per crucible. This also applies to clay crucibles.

ANACONDA HILL, BUTTE

Horace V. Winchell, Mining Geologist

AN INTERVIEW, BY T. A. RICKARD

Mr. Winchell, you were born in Montana?

No, sir; in Michigan, in 1865.

Were your parents of New England origin?

My father was born in New York State and my mother in Vermont.

What was your early education?

I attended the public schools of Minneapolis and the University of Minnesota and finished at the University of Michigan, graduating in the class of 1889. I went there to study with my uncle, Alexander Winchell, who was then Professor of Geology in the University of Michigan.

Your family has been conspicuous in geology, has it not?

My uncle, Alexander Winchell, was one of the early State Geologists of Michigan and Professor of Geology for many years at the State university. My father, Newton H. Winchell, a younger brother of Alexander, was, for a quarter of a century, State Geologist of Minnesota, and Professor of Geology in the University of that State for many years. These two brothers with others established and my father edited and published during its entire existence of 18 years 'The American Geologist', which was the first monthly geological journal published on this continent.

So you were brought up in an atmosphere kindly to mining? You intended when a boy to become a mining engineer or geologist?

I did, my interest has always been in the practical side of geology and in connection with the application of that science to the art of mining. I have never been interested in the other branches of geology, such as paleontology or stratigraphy.

After graduation at the University of Michigan, what did you do?

Prior to graduation even I was engaged in geological work with the field-parties of the Minnesota survey, assisting my uncle, who was engaged in that work for two or three years, and my father, in the study of the iron-ore regions of northern Minnesota. Immediately after graduation I began work as an assistant on the Minnesota survey and made a special study of the Mesabi iron range.

What was the result of this work?

The first result of this geological investigation was a joint report by my father, N. H. Winchell, and myself upon the iron ores of Minnesota, a volume of 430 pages, published in 1891, a year before the first production of ore from the Mesabi range. The geological map that

NORTH-SOUTH CROSS-SECTION THROUGH IRON-BEARING BIWABIK

accompanies this report was prepared and printed in 1890 and upon this map was shown for the first time the approximate location and extent of the Mesabi range. I was so convinced at that time of the importance of the Mesabi, although it had not yet been explored, that in that report we made the prediction that its production would exceed that of the Gogebic range in Michigan, which at that time was one of the wonders of the world and produced much the largest amount of high-grade iron ore mined in any one district.

What has been the production of the Mesabi range since then?

The Mesabi range, since its first shipment of ore in 1892, has produced approximately five hundred million tons representing nearly three hundred million tons of pig-iron. It now produces more than 50% of all the iron ore mined in the United States; and if it were not for this supply, it is perhaps not too much to say that it would be a physical impossibility for the United States to play its part in the present war.

Having accomplished this geological reconnaissance, what did you do next?

The general report upon the iron ores of Minnesota was followed in 1892 by a report of my own upon the Mesabi range. This was the first report upon this region describing its extent, its geology, the character of its ores, and attempting to estimate the cost of production and its relative importance in the iron industry. This report was re-published a number of times* and was used by all of the prospectors on the iron range for several years. Its conclusions were confirmed by monograph LII published some 15 years later by the U. S. Geological Survey, by Charles R. Van Hise and Charles K. Leith.

Were you given proper credit for your earlier work?

Not at all: my report was barely mentioned. By the way, that reminds me that, in 1890, I wrote an article in the 'American Journal of Science' suggesting the origin of the Lake Superior iron ores by chemical oceanic precipitation. This theory, which was ridiculed at the time, has later been adopted holus-bolus by the Lake Superior geologists of the U. S. Geological Survey as their fundamental concept, likewise without reference to the first presentation of the idea.

So you became thoroughly familiar with the geology of the iron deposits?

The fact that I was optimistic regarding the Mesabi range, led to my employment early in 1893 by the Minnesota Iron Company, which was at that time the largest producer of iron ore in the world, under the direction of Mr. Don H. Bacon, subsequently in charge of the operations of the Tennessee Coal & Iron Co. and now residing at New York, where I saw him a few days ago. My association with Mr. Bacon was one of the pleasant experiences of my career. He was always stimulating, sympathetic, and appreciative, and was easily brought to a belief in the importance of the Mesabi range at a time when other iron men were unbelieving. If Mr. Bacon's plans had been adopted, the control and management of the best deposits of that region would be vastly different today.

What objection was there to the development of these iron resources?

It will be remembered that there was a period of financial depression in 1893; at that time there was not a great demand for iron ore; those who were interested in the iron mines were also interested in steel plants, and they believed that if the Mesabi possessed such vast deposits as were indicated by my report, iron ore would have very little value. For that reason they were dilatory in buying the lands which I recommended and which Mr. Bacon urged them to purchase. The result was that other interests, notably John D. Rockefeller, acting on the advice of W. J. Olcott, and appreciating their value, acquired various properties almost as rapidly as they were developed and soon controlled many of the largest

---

FORMATION, MESABI DISTRICT, MINNESOTA. U. S. GEOLOGICAL SURVEY.

deposits. At that time I used to write an occasional unsigned editorial for the 'Iron Trade Review' of Cleveland, the recognized organ of the iron-ore industry. In one of these editorials, I remember analyzing the consumption of iron ore and pointed out the fact, which in a short time became evident, that all the ore of the Mesabi range would soon be needed to keep up with a greatly expanding industry, and that, instead of a calamity, it was a blessing to the country, because it became available in the nick of time.

Can you quote from that editorial?

In the 'Iron Trade Review' for February 16, 1893, under the caption 'Is There a Shortage of Bessemer Ore?' I called attention to the dwindling of supplies, and reached the conclusion expressed above, stating that "there is most decidedly a shortage, amounting almost to a famine, in the visible supply of Bessemer ore. The day of more general utilization of the basic process of steel-making may be nearer at hand than is generally supposed."

Observing that the information contained in articles regarding the reserves of iron ore in the United States, published in England and abroad, were, in most cases years behind-hand, I prepared for the North of England Institute of Mining and Mechanical Engineers, a paper upon the Lake Superior iron-ore region. This won for me the annual medal awarded for the best contribution to the transactions of that technical society in that year, and in that paper I made what was then considered the wild guess that the Mesabi might produce five hundred million tons of iron ore.

When was this?

In 1896.

How long were you engaged in your work on the iron region of Minnesota?

The financial depression of 1893 brought about a cessation of exploratory work by the Minnesota Iron Co. in 1894. I then engaged in general practice and, in connection with it, established a chemical laboratory at Minneapolis in partnership with F. F. Sharpless. This laboratory starved through a precarious existence for less than two years. My professional connections from that time became more and more diverted to the Western mining districts.

To which districts in the West did you go first?

My first examination of mining property in the West was made for James J. Hill in 1894; he sent me to the State of Washington to examine iron ore and coal deposits. I also recall examining gold mines at Murray, Idaho, and in the Black Hills of South Dakota, in 1894 and 1895. Later, in 1898 I went to Butte at the instance of Mr. David W. Brunton, to study the Anaconda mine, in connection with apex litigation in which Senator W. A. Clark was plaintiff and the Anaconda Copper Mining Co. was defendant.

How did you meet Brunton?

I met Brunton at a meeting of the American Institute of Mining Engineers in Minnesota in 1897. I prepared a little hand-book for that meeting, descriptive of the various iron mines, and acted as a kind of guide to the members on their visit to the iron ranges, pointing out the interesting features and describing the geology in little talks on the spot. My next meeting with Brunton was on a train in Colorado, early in the following year, on which occasion he broached the idea of the Butte engagement. I promptly declined, saying that I had assured my wife that there was one place in the world where she never would have to live, namely, Butte, but Brunton's persuasive arguments induced me rashly to make a proposition, which I had no idea would be accepted. The result was a telegram from Marcus Daly, saying "When can you be here?" I agreed to spend one year at Butte, but actually spent eight. During this time I was engaged in the organization of a geological department for the Amalgamated Copper Co. which was organized after I began my residence at Butte, about the year 1900.

I remember meeting you at Butte in 1898 and being im-

pressed by the spacious room all lined with books in which you had your office and remarking the fact that you were able to do your writing amid thoroughly congenial surroundings.

That was in 1901, I think. My early efforts as an author impressed upon me the necessity for books of reference. When writing the volume on 'The Iron Ores of Minnesota', I prepared a bibliography and found it necessary to send East to borrow many books of reference. Libraries in the West at that time were and perhaps even now are incomplete; hence with the library of my uncle, Alexander Winchell, as a nucleus, I began spending all my spare cash in the purchase of books. This resulted in the collection of an excellent library upon the subjects in which I was interested.

So you began to participate in apex litigation?

The particular lawsuit which brought me to Butte lasted more than one year and was settled finally in favor of the Anaconda company by a court decision that was based entirely upon geological structure. It was in this case that the existence of the so-called Blue veins of Butte was first announced. These veins have proved to be some of the richest and most important in the Butte district.

When was your attention first drawn to the theory of secondary enrichment of copper ores?

In studying the ore deposits of Butte, I had the invaluable assistance and co-operation of Clarence King, N. S. Shaler, R. W. Raymond, Louis Janin, J. P. Iddings, W. H. Wiley, and others. King's interest in the subject, his breadth of mind, his wide experience, were most helpful. He was one of the most delightful and interesting men with whom I have ever been associated and his memory has always been a source of inspiration. In connection with the solution of our problems it was important to be able, if possible, to distinguish clearly between the old Anaconda vein and the later Blue vein; both of them contain rich copper ore and yet one is clearly later than the other. It was necessary to show in what respects their mineralogy differed. The occurrence of the chalcocite suggested to me, freshly from the study of the iron-ore deposits of the Lake Superior region, where descending waters have done all the work, that the formation of at least a portion of this chalcocite might be due to the action of descending waters. This idea had not, so far as I know, ever been suggested or discussed previously. In order to test the possibility of such chalcocite deposition, I secured permission to establish a chemical laboratory in which to conduct the necessary research. My chemist was C. F. Tolman, Jr. Chemically, our difficulty lay in finding the reducing agent that would reduce cupric sulphate to cuprous sulphide. The only chalcocite and bornite recognized as secondary, and mentioned in chemical literature up to that time, was that found upon the bronze coins discovered in the hot springs at Bourbonne-les-Bains, in southern France. The French chemists attributed the formation of these minerals to the reducing action of organic matter. My first experiments, therefore, were with the use of all sorts of organic compounds. The invariable result, however, was not the formation of any sulphide of copper, but the native metal. Its formation in such a manner is illustrated in the fire-zone of the mines at Butte and in other districts where the mine-waters have penetrated charred timbers and deposited scales and particles of native copper to their very core.

May I suggest also the deposits characteristic of the Permian sandstone in western Siberia and in the Ural region, where native copper is deposited on fossil remains, particularly those of plants?

Yes; I think this is characteristic of the Permian in many parts of the world, such also as Texas and the Mansfeld district in Germany. I remember finding in the bottom of a shaft at Butte an old tarred manila rope that when unwound disclosed a mass of native copper, several inches thick, encrusting the rope. Finding that organic matter did not produce sulphide minerals, we experimented with hydrogen, and with hydrogen and ammonium sulphides, and the sulphides of the alkalies, inasmuch as the rock minerals contain soda and potash, but here the result was not chalcocite (Cu_2S) but covellite (CuS). In connection with the study of the processes of oxidation we discovered that cupriferous iron sulphide produced sulphurous acid, whereupon we thought that this might be the long-sought reducing agent. Using therefore mine-waters of known composition and jig-concentrates from the Parrot mill, and a solution saturated with SO_2 in jars sealed from the air with paraffine, we were gratified at finding in a few months that all the copper previously in solution had been deposited as crystallized chalcocite, coating the fragments of primary ore. This was the first time that chalcocite had been produced synthetically and it was a demonstration of the possibility of its formation from descending sulphide solutions; in other words, this was the starting point for the theory of secondary sulphide enrichment, subsequently elaborated by Emmons, Weed, and Van Hise. It is interesting to note that Van Hise's conclusion was based entirely upon deduction from chemical principles, whereas my conclusion was based upon experimental research.

When did your research culminate in this discovery?

In 1899 or 1900.

Then it was a pure coincidence that Van Hise's deductions appeared on the same date as the announcement of your results?

Oh, no; my announcement was not made until two or three years later in a communication to the Geological Society of America. My lips were still sealed and I was unable to do any writing for publication during the progress of the litigation at Butte. It was thought that if I promulgated a theory which could by any possible means have a bearing upon the litigation, that if my theory seemed to favor the side I represented, I should be accused of attempting to frame a case in advance; if, on the contrary, it could by any interpretation be made

THE SHENANGO IRON MINE, ON THE MESABI RANGE. U. S. GEOLOGICAL SURVEY

to favor the other side, it would be used against us. The date of the experiment and of the discovery, as given just now, is stated in the proceedings of the Geological Society of America, Vol. 14, page 269.

To what did you turn next?

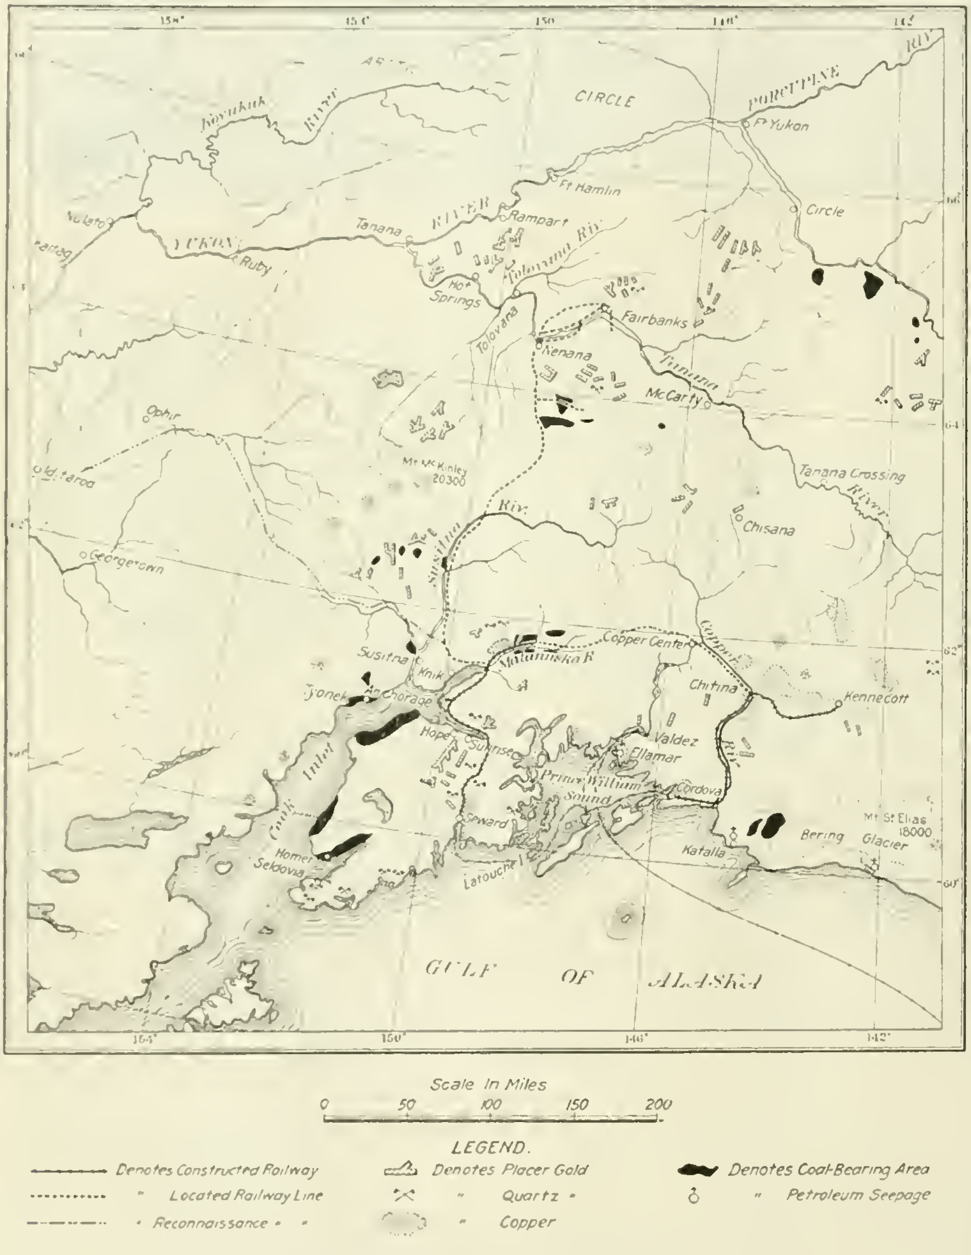
During the next eight years, that is, until 1906, I was in charge of the Geological Department of the Amalgamated Copper Co. and the results obtained by regular systematic recording of observations underground were so satisfactory that many other mining companies followed suit and established departments of geology. This was one of the earliest experiments along this line and such pioneer work seems to have been well justified. A large part of my work was in connection with the Heinze litigation, but there were also many outside investigations and examinations of mines all over the West and in Mexico, for the Amalgamated. When the Heinze troubles were settled in 1906, I left Butte and became Chief Geologist for the Great Northern Railway Co., a position that I occupied for about two years, with headquarters at St. Paul. During this time, I explored iron-ore properties in Minnesota and large coal deposits in Wyoming, Montana, and British Columbia, and purchased lands containing hundreds of millions of tons of both coal and iron.

When did you go to Alaska?

I have made ten trips to Alaska; my first extended trip was in 1903. During the summer of that year, I spent several months in the examination of copper mines both along the coast and in the interior, particularly in the Copper River region. My examination was made for H. H. Rogers, John Hays Hammond, and their associates. It was part of my duty to look into the question of railroad construction in that region and to report upon the general prospects for the development of valuable mines. No law at that time had been passed by Congress for the location of coal in Alaska. This was first permitted under the law of February 1904. On the occasion of this visit, I had an amusing experience with Stephen Birch. Mr. Birch was in charge of what is now known as the Kennecott mine; he had been instructed by telegram, which was taken overland more than a hundred miles by an Indian, under no circumstances to let me see this property. He carried out his instructions faithfully, although it was the Fourth of July, and we were regaled with Scotch and cigars, his military force to the number of nine men being each provided with a loaded rifle and a bottle of whiskey wherewith they successfully repelled invasion. Since leaving the employ of the Great Northern Railway in 1908, I have been engaged in general practice with an office in Minneapolis and during that time have visited most of the mining regions in North America, besides others in South America, Europe, and Asia.

When did you get into the controversy over the Cunningham claims in Alaska?

My first intimation of the existence of coal in Alaska came from Mr. H. T. Burls, an engineer associated with Sir Boverton Redwood. I met Burls on my Alaska trip in 1903. He was then on his way to examine an oilfield near Cold Bay, west of Kodiak island, and I accompanied him. Burls told me that he had twice before examined and sampled high-grade coal outcropping in thick seams back of Controller bay. He told me that a large tract of land had been staked by an English company in this district and that the quality of the coal was superior to that of any to be found elsewhere on the Pacific Coast. As already said, there was no law providing for the location of coal in Alaska and although the English company at a considerable expense long maintained their operations and possession of their properties, and did considerable development work, yet the lands were taken from them by the United States government. Some years later, in 1909, I learned from M. K. Rodgers, lately deceased, that a number of claims had been located under the law of 1908 by Clarence Cunningham and 32 associates. Rodgers brought samples of this coal to St. Paul and showed them to Mr. Hill and myself. He was then in charge of the construction of a railroad from Katalla to the Kennecott mine for the Guggenheim interests. This railroad was never completed. There was not a good harbor and the winter storms destroyed the breakwaters and harbor improvements, which had been constructed at the cost of more than $1,000,000. Becoming somewhat interested and believing that there was great need for first-class coking-coal on the Pacific Coast, I looked up Mr. Cunningham and investigated the status of his claims. I found that he and his friends had located 33 claims in one group and that their claims had been developed in accordance with the terms of the act of Congress and that they had been approved for patent and the requisite payment, amounting to $52,800, made to the General Land Office, and that these various claims were held by the original locators. Acting under the advice of competent lawyers, I proceeded to acquire some of these claims, before patent, but after the issuance of a receipt from the Commissioner of the General Land Office. I visited these claims myself in 1910, in company with competent geologists and coal-mining engineers, notably, Frank C. Greene, of Cleveland, and my brother Prof. A. N. Winchell of the University of Wisconsin. On the way to Alaska we were shipwrecked in the middle of the night and our vessel, the 'Ohio', went to the bottom with all our equipment. This made it necessary for us to return to Seattle in order to procure new supplies, instruments, and other outfit, so that our examination of the properties was delayed. This was not the first time that Mr. Cunningham, in attempting to acquire and develop in Alaska an important industrial product for the Pacific Coast, had been shipwrecked. The property was difficult of access and the hardships he underwent and the undoubted good faith he displayed in that entire unfortunate affair deserved a better fate than was accorded to him by the conservation-mad administration at Washington. The action of the Government in confiscating these claims, and in retaining the money paid for them, is to my mind one of the black spots on our national escutcheon and comparable only to similar happenings which have come under my own observation in Russia and the Argentine. In spite of the fact that the special Commissioner appointed to look into the charges against these Cunningham locators found nothing whatever against their integrity or honesty, and in spite of the fact that two subsequent Commissioners recommended the issuance of patents, still under the slanders and foul insinuations of Gifford Pinchot and one Glavis, the Secretary of the Interior arbitrarily cancelled these claims, blackening the reputation of the good citizens who had located them in pursuance of the invitation contained in an act of Congress, after subjecting them to great expense in sending attorneys to all parts of the world—London, Rome, and Paris—to take the testimony of every living locator, and even kept the money that had been paid the United States government for them. This was followed by an ingenious act of Congress withholding from patent forever the coal-lands of Alaska and setting aside as a reserve for naval purposes these particular Cunningham claims, thus making it impossible for the claimants ever to get into Court and have their rights vindicated.



MAP OF PART OF ALASKA SHOWING COALFIELDS

So you devoted a good many years to this bitter controversy and to your attempt to obtain justice?

Yes, it was somewhat difficult for a time for me to feel the deep sense of pride and warm patriotism which should be in the heart of every American. It was a bitter pill to me.

When did you go to the Argentine?

In 1912 I made the acquaintance in England of a prominent Argentino, Dr. Julio Pueyrredon, the brother of the present Minister for Foreign Affairs in that country, who handed the notorious Dr. Luxburg of 'spurlos versenkt' fame his walking-papers. By Señor Julio Pueyrredon I was invited to go to the Argentine and acquire petroleum lands in Patagonia, near the port of Comodoro Rivadavia. This oilfield is the most important in the Argentine; it was discovered by the Bureau of Geology and Hydrography while sinking an artesian well on a desert coast for water. The oil is not of high grade but it is of considerable value in the absence of coal mines. The land was located under the Argentine mining law and the title was supposed to be good. I went down there early in 1913; I found an interesting district and had a pleasant excursion. Before I left the property, however, the President of the Argentine Republic, imitating the action of the United States in a similar case already referred to, issued an order cancelling all the locations, creating a Government reserve 40 miles square, and instructing the Administrator of Public Works to proceed to develop the land by drilling wells, to make harbor improvements, and to build an oil-refinery. When I returned to Buenos Ayres and expressed my willingness to complete the purchase of these properties, I found that title could not be obtained. I was told that the Argentine law specifically forbade the Government to engage in any mining operations, which appeared to be true, as I discovered by translating into English the entire Codigo Mineria, which manuscript I still possess; and although I was further advised that the President had no authority to cancel the locations made validly under the law, nevertheless these locations were cancelled and I am informed that the Government controls the entire oilfield today. Such arbitrary acts are not only manifestly unjust, but so weaken the confidence of those having money to invest in the development of mines that in many cases important mineral districts remain idle and unproductive. What a boon it would now be to our country if Alaska were producing several thousand tons of coal per day! It is there in abundance, safely 'conservated' for future generations instead of being developed and used at a most critical period.

You have been in Russia recently, Mr. Winchell, and you have formed some idea of the present condition of the country, particularly with regard to participation of America in the exploitation of mineral deposits in Siberia?

I spent six months in Russia in 1917. During a portion of this time I was accompanied by Messrs. Charles Janin and Ira B. Joralemon. We arrived in Petrograd the Sunday following the revolution, and found the people of that metropolis in a strangely exalted and ecstatic frame of mind. Although sub-zero weather prevailed the people were parading the streets in groups discussing the form of government which they intended to establish. The poor misguided uninformed people had an idea that the millenium had arrived and that they were thenceforth, without delay and without undergoing any period of adjustment or reconstruction, to live in idleness and luxury. Having no idea of the problems of government nor of the organization needed in carrying on the business of the nation, they looked upon themselves as the most wonderful creators of new schemes of existence that the world had ever seen. It was perfectly apparent that disappointments and trouble were in store and that idleness such as they evidently contemplated could lead to nothing but misery.

H. V. WINCHELL, ON HIS RANCH AT GRASS VALLEY, ESTIMATING THE SEASON'S GROWTH.

The resources of Russia and Siberia are so varied and so vast that it is impossible within the limits of this interview to enter into any discussion of them. In many lines there should be opportunity for development: forestry, agriculture, mining, and manufacturing may be successfully developed and there will some day certainly be an opportunity for the business men and the engineers of the United States to play an active part in the work. I fear, however, that the Russian people have not yet seen the bottom of the grade. They are rapidly sliding downhill into a condition of anarchy and degradation which has already and will still cause the loss of many lives and the destruction of a great deal of property. It is too soon to expect the establishment of a stable government and the restoration of conditions under which the investment of foreign capital and resumption of commerce and industry will be possible. I have constantly since my return endeavored to impress upon the people of the United States a feeling of their moral responsibility toward Russia. It seems incredible that this great nation could so long stand aside and refrain from assisting the better elements of Russia in their program of rehabilitation. Without our assistance it must be years before Russia is again habitable in the modern way; with it, and the co-operation of the Allies in this present war, stable conditions may be restored rapidly. At the present time there is no safety for life or property and titles are insecure. It is my belief that there will naturally be a certain amount of disintegration, but that there will eventually emerge a Russian nation whose system of political economy will incorporate many advanced socialistic ideas, some of which may perhaps be an improvement upon anything the world has heretofore known.

You have taken a leading part in arousing public interest in the defects of our mining laws, particularly those based upon the so-called law of the apex. Will you please state definitely your attitude in the matter?

An overwhelming majority of the mining men of the United States are opposed to our present Federal Mining Law. It is only here and there that some theoretical and ultra-conservative student of the subject expresses himself as in favor of the retention of the law of the apex. This unfortunate provision of our laws is a constant source of expensive litigation and is a handicap to the mining industry.

There are several other features of the present laws that do not adequately protect the prospector in searching for and developing our mineral resources. There is no provision under our present system for opening to exploration by the public at large those vast tracts of land which have passed out of the Government ownership into the hands of private individuals. Most countries have retained some jurisdiction over their mineral resources and make it possible for the prospector to enter upon any lands, whether owned by the government or by individuals, under provisions which safeguard the rights of the individual owner, and to sink shafts, drive tunnels, or explore by drilling for underground orebodies. The time is approaching when all the public domain will have passed into the hands of private owners, and in many cases these lands will thus be not only withdrawn from the field of the prospector, but foreclosed against his operations by the unwillingness of the private owner to permit mining and prospecting work. The inevitable result will be a decline in the mining industry. It is well known to all of us that mines do not live forever. As you, Mr. Rickard, have well said, "even Methuselah died"; and the production of ores in such an active country as the United States can only be maintained over long periods by the discovery of new mines. For this reason I have advocated the incorporation of some provision in our statutes providing for the development of mines upon all lands sold by the Government to private individuals. I believe it may even be necessary, in view of the court decisions upon this matter, for us some day to adopt an amendment to the National Constitution declaring the mining industry paramount and making it possible for mines to be developed wherever they may be found, regardless of the wishes of the owner of the surface, but at the same time making a suitable provision for recompensing him for surface ground actually occupied and for damage to crops and improvements.

Do you think that there is any prospect of amending the mining laws in the near future?

There is not only a prospect that the laws will be amended, but they are actually being amended and not always under the advice of competent and experienced mining men nor in ways best calculated to promote the general interest of the industry and the country at large. There is a great deal of inconsistency in the present laws as applied to the various classes of mineral products, and there is frequently a conflict between the clashing interest of the agriculturist, the stock-grower, the lumberman, and the miner. The subject is one that should be submitted to careful analysis and study by representatives of the interests involved, and the laws should be given a thorough revision so as to make them as simple as possible and at the same time productive of the best results. I see no immediate prospect for such a revision as this. It has been recommended time and again by the Secretaries of the Interior and by Presidents in messages to Congress without eliciting any general response. What is everybody's business is nobody's business, and this subject which affects in many ways every individual in the country is understood by few and neglected by all.

You have taken prominent part in the work of the American Institute of Mining Engineers. I would like to ask you what you consider to be the principal functions of the Institute as an organization of Mining Engineers?

The existence of such an organization rests primarily upon and can only be justified by its usefulness to its members, and the industry which they represent. I should say the underlying concept is that of service; service, first, to its members by furnishing them with some means of becoming acquainted with each other, by giving them in published form the results of the latest discoveries and developments in their chosen field of work, and by providing a forum for the discussion of questions upon which different opinions are entertained; service to the industry at large and to the communities in which such industries are operated; service to the country by increasing its productivity and efficiency and in supplying the minerals needed in commerce, manufacturing, and in all the manifold requirements of an industrial nation.

These are days of organization; of co-operation and of

GUANAJUATO, MEXICO

joint effort. No man is sufficient unto himself alone; the best results in all lines are achieved by a combination of minds and of efforts. It is my belief that the attention of the American Institute of Mining Engineers should be directed to every branch of political economy and national life with which the production of minerals and their utilization is even remotely connected. I believe that the engineer in the past has been too secluded; too much engrossed with his own particular and individual problems, and that his services and information have not always been as fully utilized for the general public good as their real importance justifies. Nothing has made this idea more emphatic than the events of the past few years. It should be the effort of every engineer in the period of reconstruction to take an intelligent and active part in the problems which are now arising for solution, recognizing, as he must, the fact that the achievements of engineers and the production of our mines have made it possible for us to play our part in the world conflict now coming to a close. We must realize further the great field of expansion which lies just ahead. It is a source of pride to every member of the Institute to know that its policy is now so shaped as to enable it to take its part in the work.

The mining industry must and will be expanded. We are on the eve of important developments and are entirely confident in the ability and the intention of the American engineer to take a prominent rôle, both at home and abroad.

SPOUTING OIL-WELL IN THE ARGENTINE

Gold Production in the British Dominions

By WILLIAM FRECHEVILLE

*In making a review of the world's gold production during the twenty years from 1897 to 1915, both included (1915 being the last year for which figures are available), it is seen that it has increased from 43 millions sterling in 1897 to 98 millions in 1915. In examining the statistics given annually in the American publication 'Mineral Industry', it is seen, for instance in those given for 1915, that 44 different countries contributed to the world's total, and attention may be drawn to the fact that the large number of different countries contributing to the supply, gives a certain amount of stability to the total output.

The British empire is the largest contributor.

The following details are given in the above statistics for 1915:

Transvaal	£38,679,918
Australasia	9,890,446
Canada	3,896,496
Rhodesia	3,891,770
British India	2,369,670
West Coast of Africa	1,708,580
British Borneo	271,400
British Guiana	215,288
Malay States	72,330
United Kingdom	3,964
Total	£60,999,862

The production of the British empire increased from 26 millions sterling, forming 60½% of the world's production, in 1897, to 61 millions, given in detail above, and forming 62¼% of the total, in 1915.

On looking at the yearly figures during this period in Table A, it is seen that the increase has, on the whole, been gradual and persistent, except during the Transvaal war, when the proportion of the world's production contributed by the British empire fell to 47% in 1901.

This feature of steady increase applies to the world generally, as well as to the British empire; in both cases, although there are decreasing sources of supply, this feature is more than made up by increases in other directions.

In connection with the decreasing sources of supply, it may be pointed out that the constant improvements in method and appliances tend to make the exhaustion of the older districts slower than may be calculated on the data available at any given time, and, on the other hand, the periodical discovery of new districts makes it impossible to forecast with any degree of accuracy what increases the future may have in store.

On looking at the discoveries of new districts made during the last 40 years, it is found that they certainly show a tendency to occur periodically. This is illustrated by the following table of dates:

Pilgrim's Rest, Leydenburg, Transvaal	1873
Indian Gold Mines (Mysore)	1880
Witwatersrand, Transvaal	1886
Western Australia, Kalgoorlie	1893
Klondyke (Yukon), Canada	1897
Porcupine (Ontario), Canada	1909

The periodicity of the discoveries is no doubt due to the gradual extension of the area prospected. Considering the large areas, both in the British empire and in other parts of the world, still to be examined, it is exceedingly unlikely that a line should be drawn now, and that this phase of exploration and discovery can be considered to have ended.

In connection with this aspect of the subject, attention may be drawn to recent reports regarding the Belgian Congo. It has been known for some time that gold existed in the Kilo district, north-west of Lake Albert Nyanza, and shipments of gold have been made from there for some years. Sir Alfred Sharpe traveled through those parts recently, and an interview with him was published in 'The African World' on July 7 of last year, in which he is reported as saying that the discoveries are assuming great importance and give the impression that a large goldfield exists there, which is awaiting development, but that up to the present time it has been the policy of the Belgian government to reserve the deposits, which are both alluvial and reef, as a Government monopoly.

It may be pointed out that in the case of the discovery of payable gold mines in the working of which British companies can take part in regions outside the British empire—particularly if the neighboring country is not in an advanced stage of industrial development—the machinery and stores required by these British companies will, to a great extent, be purchased in the British empire, and the gold they win will be sent there to be realized. On the other hand, in this particular instance one can well understand that there may be, for several reasons, reluctance to admit outside capital or outside white population.

The six principal gold-producing countries in the British empire are the Transvaal, Australasia, Rhodesia, Canada, British India, and the West Coast of Africa, and the figures of yearly production in each of these countries for the 20 years ending with 1915 are given in Table B.

THE TRANSVAAL. The increase from 11½ millions sterling in 1897 to 38½ millions in 1912 was large and continuous if the period of the Transvaal war is omitted.

After 1912 the figures fluctuate somewhat, but show no decided tendency, either upward or downward. The

1933 ...	450,000	12,360,000	1933 ...	450 000	7,830,000	1933 ...	——	— 4,530,000
								Decreasing rapidly thereafter (probably at the rate of 1,000,000 tons or over p.a., for several years).

Notes:—1. Where possible the estimates are based on official estimates of life and dates of commencement of milling.
2. Estimates are based on pre-war conditions. If costs continue at present level the rate of decrease will be *much more rapid.*
3. The estimates of new mines opening up (exclusively Far East Rand Mines) are, in my opinion, on the liberal side.
4. Far East Rand Mines lying outside the Central Zone are excluded

---

general consensus of opinion appears to be that on the basis of present conditions, production has about reached its zenith, and from now on a gradual falling off may be anticipated. It is true large new areas in the far Eastern Rand are being developed and equipped, but the new production from this source, on the basis of what is at present known, is not expected to make good the deficiencies caused by old mines closing down.

In order to throw some further light on this subject, I have had a statement prepared, dealing with the next 10 or 12 years (see Table C). This statement is in the nature of an account in which the new tonnage to be crushed is taken on one side, and the probable loss of tonnage due to mines closing down, on the other, and the balance is shown in the last column. From this table it appears that on balance a reduction of over one million tons is indicated in 1919, equivalent to 27s. per ton to £1,350,000. The loss of tonnage rising to over three million tons in 1920, and that then for the following 7 years the further anticipated losses and gains very nearly neutralize each other, but that after that further reduction is indicated.

This estimate, however, must be taken for what it is, namely, an attempt to get some approximate figures based on what is known. The problem is complicated by the fact that the ore for the new stamps in the Far Eastern Rand is likely to be somewhat better than that at the old mines closing down; also by the fact that experience in the past shows that the operation of actually exhausting one of the old mines generally takes longer than originally anticipated, and further, by the uncertainty as to possible extensions of the ore-bearing beds beyond their present known limits. It will be noticed that all these factors operate against the calculated fall of production.

Australasia. During the first part of the period of 20 years under review, the production increased from about 11 millions sterling in 1897 to at little over 18 millions in 1903, owing to the growing output of Western Australia. After 1903, however, there was a steady decline, and in 1916 the output of gold had shrunk to 8⅓ millions sterling.

The present indications are that this decline will continue, unless new goldfields are opened out, of which there are as yet no indications. An examination of a map of Australia on which the goldfields are marked, will, however, I think, justify a hopeful view with regard to the future. It will be seen that the goldfields are fairly well scattered over the known coastal regions, and the idea appears to be justified that probably when the central and northern parts have been traveled over, and properly prospected, other goldfields will be found.

Canada. The gold production amounted to 1¼ million sterling, in 1897, and increased to 5¾ millions in 1900, owing to the yield of the Yukon. These deposits, however, proved to be only alluvial, and a falling off soon took place, and in consequence, the gold production of Canada declined to 2 millions sterling in 1909. In that year two or three rich quartz veins were discovered at Porcupine in the northern part of the province of Ontario, and since then the yield of Canada has again taken an upward turn, and in 1916 amounted to 4 millions sterling. Since then the production of these mines has been seriously curtailed, owing to scarcity of labor, but the position of the gold-mining industry of Canada points to an expansion in the future. It is true the production of the Yukon is likely to continue to decrease, but this should be more than counterbalanced by the position in northern Ontario, where the older mines are in a sound position, and small new producers are being discovered from time to time. An important factor in the future possibilities of Canada, as a gold-producing country, lies in the large expanse of unexplored country, which stretches up north from the comparatively narrow occupied belt extending from the Atlantic to the Pacific.

Rhodesia. The production shows a gradual and continuous increase from nothing in 1897, to just under 4 millions sterling in 1916. The gold derived from a number of quartz mines, worked on modern lines, with considerable reserves of ore, and although one or two mines are known to be failing, there is no reason to apprehend any sudden change.

India. The principal producers are the quartz mines in Mysore, which have been very considerable and consistent producers for the last 30 years, worked on sound lines, with good reserves of ore opened out ahead of immediate requirements, and nothing is known to indicate any considerable change in the position, or of any distinct signs of failing. On the other hand, they are becoming very deep, and in the ordinary course of events, a falling off in production would seem to be probable in the not far distant future, unless new mines are opened up. So far there are no reports or suggestions of new gold discoveries in India, but some of the country north of it has been reported by travelers to be gold-bearing.

West Coast of Africa. The production has increased slowly from £200,000 in 1897 to a little over £1,500,000 in 1916. No doubt, if it were not for the climate, the production would have been much greater. Nothing is generally known to indicate that any serious falling off is looming ahead. The climate, as already remarked, has been the great drawback to the industry.

General Conclusions. Assuming that gold mines will soon be able to work again under normal conditions, and that the effect of the War will be limited to an increase of working costs in some cases of as much as two shillings per ton, it does not appear to me likely that such a rise would have a serious effect on the production of gold.

On the above assumption that the industry will go on in its normal course, and in the light of what is known about the principal gold-producing districts of the Empire, it appears that a falling off may be expected in the Transvaal, and in Australasia, but an increase in Canada, and that there is no very plain indication as to the probable course of events in other directions.

Setting the probable increase in Canada against the decrease in Australasia, there remains the anticipated falling off in the Transvaal and a consequent probable decrease of about 4 millions sterling annually in the total gold production of the Empire in the near future.

Against this must be set the possibility of unexpected increases and of new discoveries—two factors of such an uncertain nature that it would be idle to attempt to appraise them accurately.

There is so much unprospected territory in the Empire that, personally, I look forward to further discoveries, sooner or later, with a good deal of confidence.

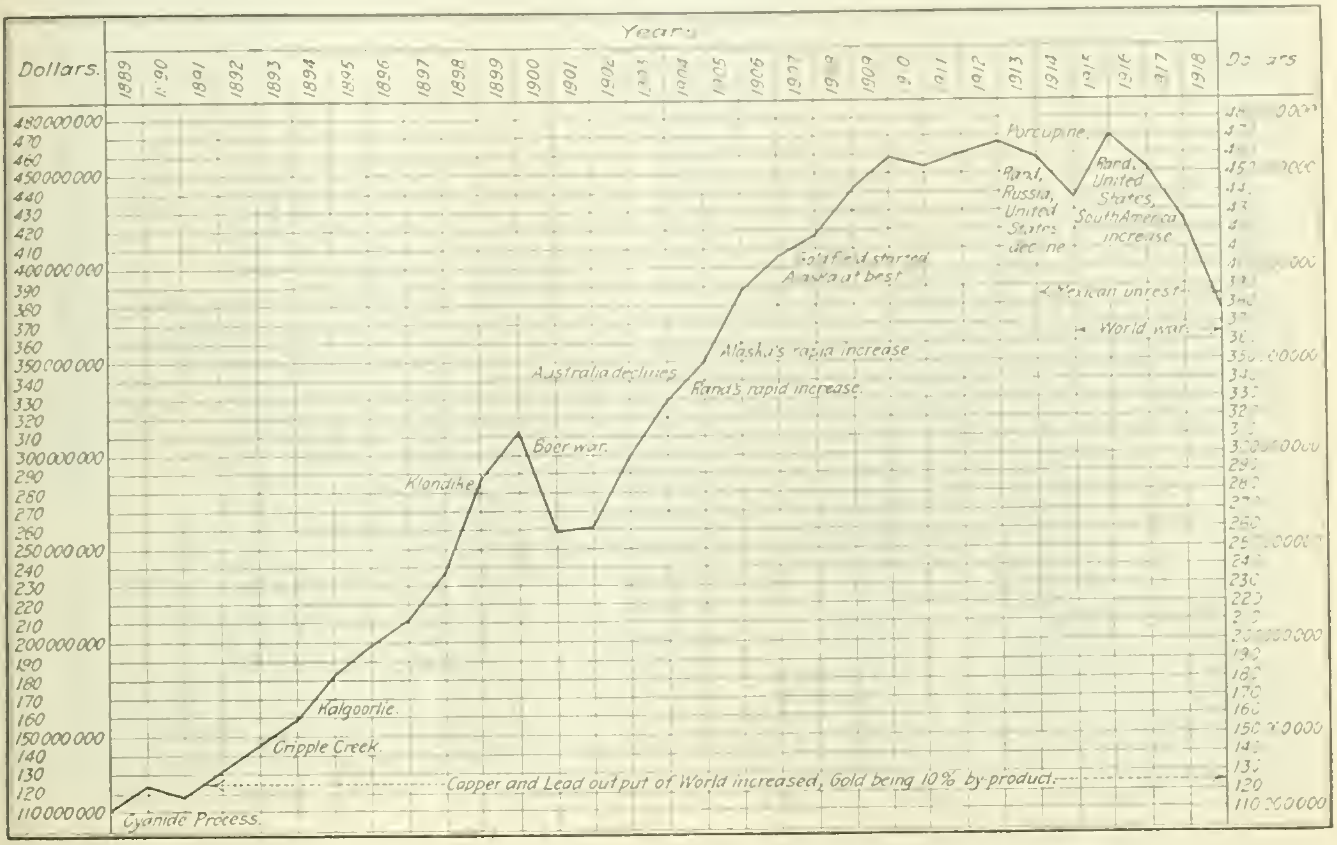
Boarding-houses operated by mining companies are often operated at a loss, due to a low charge made for food, also to certain fixed charges. In isolated districts a company house is of great benefit to employees, they responding by being more content and giving better efficiency. The Alaska Treadwell group boarding-house generally ran at a loss. A recent instance is that of the Snowstorm Mines Consolidated at Troy, Montana, where during 1918 the house loss was $4868. Company stores are also a great convenience, both to employees and the public.

Graphics of Gold and Silver

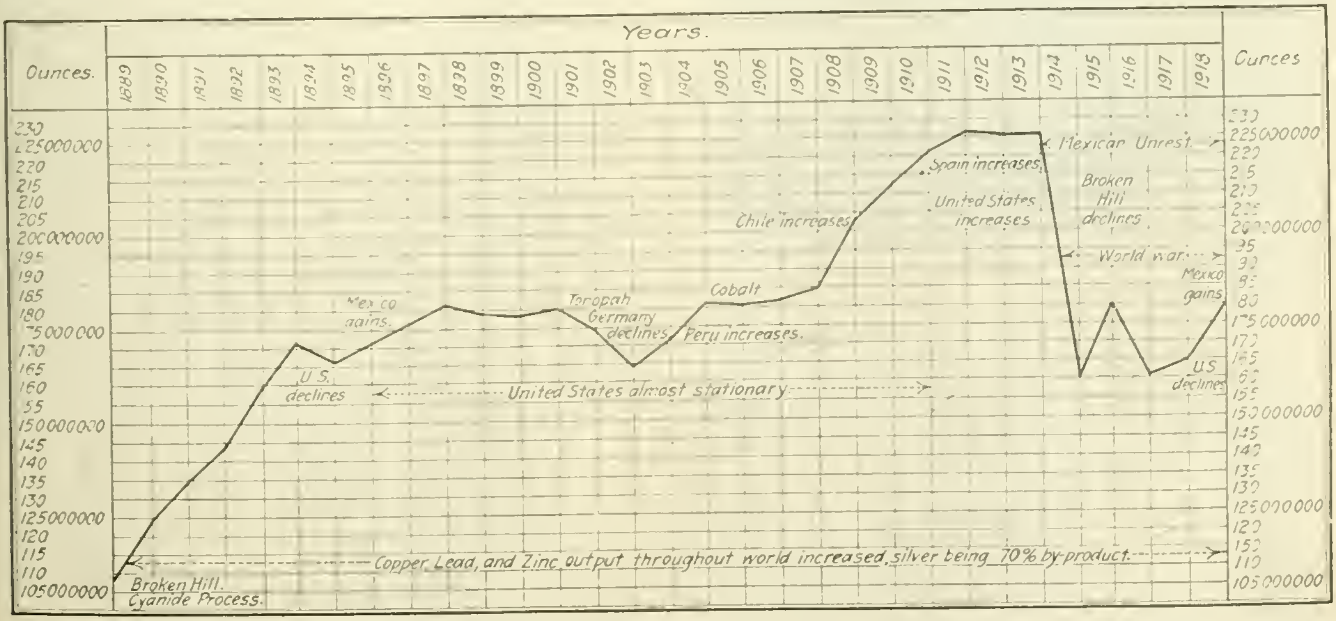
By M. W. von BERNEWITZ

Amid the instructive matter that we published last year on the precious metals, many calculations and tables were given, yet, with the exception of H. N. Lawrie, the graphic method was not used. To make up for the lack of such records I have prepared the accompanying graphs.

A table of yearly outputs leaves much to be considered, but a chart showing causes and effects of certain movements briefly explained thereon makes the problem easier understood. While preparing these curves, it was quite interesting to note that frequently when one country had reached the apex of production and declined rapidly, another country took up the running, as it were. I have followed the progress of gold and silver for 25 years, and hope that some fresh causes will soon arise to move the curves diagonally upward.



Graph Showing Gold Production of World For 30 Years.



Graph Showing Silver Production of World For 30 Years.

Staff of the War Minerals Investigation Committee, U. S. Bureau of Mines

Reading from left to right:

A. G. White—In charge of the sulphur resources, also administrative assistant to the executive of the War Minerals Investigation; mine economist for the Bureau of Mines; secretary of War Minerals Committee.

J. E. McGuire—In charge of the War Minerals Investigations of chrome and tungsten.

J. C. Orchard—Assistant mine economist for the Bureau of Mines. In charge of the editing and publication of a series of confidential reports on the political and commercial control of the world's mineral resources.

W. C. Phalen—Mineral technologist for the Bureau of Mines; field-work on manganese for the War Minerals Investigations.

G. J. Salmon—In charge of labor problems connected with the metal and non-metalliferous mining industry; member of committee on mechanical labor-saving devices as applied to mining. Also in charge of matters related to industrial furlough from the Army in co-operation with the War Department.

A. W. Stockett—In charge of the War Minerals Investigations for potash resources. Also a member of the committee of the Bureau of Mines appointed to advise the Capital Issues Committee on mining and related applications.

J. E. Spurr—Executive of the War Minerals Investigations of the Bureau of Mines. Formerly a member of committee on Mineral Imports of the Shipping Board.

H. S. Mudd—In charge of the War Minerals Investigation of graphite, antimony, and bismuth; assistant-secretary to the War Minerals Committee; member of the committee of the Bureau of Mines appointed to advise the Capital Issues Committee on mining and related applications; representative of the Bureau on Joint Information Board for minerals and derivatives.

A. E. Wells—In charge of sulphuric acid works for the Bureau of Mines in co-operation with the War Industries Board and the Chemical Alliance.

H. C. Morris—In charge of the War Minerals Investigations of various metals, and member of the committee to advise the Capital Issues Committee on mining.

C. M. Weld—In charge of War Minerals Investigation of manganese, iron ore, ferro-silicon, and later chrome; representative of Bureau of Mines on ferrous section of the War Industries Board; now assistant-executive of the Minerals Investigation.

F. H. Probert—Engaged in special field-work for the War Minerals Investigations; dean of the Mining Department of the University of California; consulting engineer to the Bureau of Mines.

H. A. Buehler—In charge of the War Minerals Investigations of pyrite; also State Geologist of Missouri.

REVIEW OF MINING

HOUGHTON, MICHIGAN

Stocks of Copper at Smelters Growing.

Accumulations of copper at Michigan smelting plants are commencing to attract attention. Stocks of finished copper on hand here are smaller than normal for February. Up to the year 1915 it was the custom for the smelters to store metal in January, and continue to pile it up until the opening of navigation, in April or May. The question of freight charges from Michigan to New York cut such an important figure in the total cost of production that the difference between the cost of freight by rail and by water was a factor that had always to be reckoned with. However, when the war demands sent the selling price of copper above 20 cents, shipments by rail to New York became common. In fact, the demand for the metal was so urgent that express shipments were made frequently in order to facilitate transportation to catch certain fast boats crossing the Atlantic. For the past four winters, then, there has been no smelter accumulation of copper and the output has been forwarded, either to war munition plants operating in this country or to the order of war departments of foreign governments at New York. Now that the copper stocks are coming in evidence again they are attracting a good deal of attention, producing as they do concrete and positive evidence of the unsatisfactory condition of the metal market as a whole.

CRIPPLE CREEK, COLORADO

Gold Output, Dividends, and General Development.

Gold production of the district in January was again below normal. The treatment plants reported 82,510 tons, worth $735,151 gross. The average value of all grades treated was low, $8.90 per ton. Compared with the December output, a decrease is shown of 4650 tons and $80,870.

The reported outputs were as under:

Works	Tons	Average value
Golden Cycle	25,500	$8.90
Portland	39,010	2.07
Vindicator	16,000	2.15
Smelters	2,000	55.00

Dividends paid during January totaled $242,000, as follows: Portland, $60,000; Vindicator, $15,000; Golden Cycle, $45,000; and Cresson, $122,000.

Another rich discovery has been made at the Roosevelt tunnel-level at a depth of 2131 ft. on No. 5 Lee vein of the Portland company. Commenting on the discovery, Irving Howbert, chairman of the Portland directors, said: "Some of the ore is as good as anything I ever saw come out of the mine. The sylvanite is sprinkled all through the rock instead of the seams as usually occurs."

Development on an extensive scale is projected by the Granite company for its Battle mountain properties. A large quantity of ore is reported available. Work will be started at the Dillon shaft, now 1500 ft. deep.

Work was resumed during the week last past by the Midget company's lessee, the Backoff Leasing Co. of St. Louis. Nine sets of lessees who were with the company when the mine was closed in December 1917 have resumed work on their respective blocks.

A promising discovery has been made by J. L. Wilson in the Anaconda tunnel penetrating Gold hill from the south. He has opened an orebody on the junction of the Virginia M and Work veins at a short distance from the portal of the tunnel and will shortly commence production.

The Vindicator Consolidated, in a letter to shareholders accompanying dividend checks of January 25, announced the resumption of development on its Bull Hill estate.

DENVER, COLORADO

Mining Situation in the State.—Good Ore at Depth at Cripple Creek.—Labor and Wages.—A Mining Survey for the State.—Wyoming Copper and Boulder County Oil.

In Denver one hears contradictory prophecies regarding the metal-mining outlook in Colorado; some persons express pessimistic opinions, but the majority of mining men speak hopefully. There is unanimity, however, in one attitude of metal miners who feel that they would discontinue operations for most of the metals if obliged to face the conditions that prevailed during the past two years. The statement made by the U. S. Geological Survey to the effect that the 1919 output of gold in this State was the least in 20 years, while that of silver was the smallest since 1913, fixes in one's mind the status of these metals. Colorado, the 'silver State', stands fifth in silver production, although occupying second place in the yield of gold. Leadville had a disappointing year in many ways. The districts decreased output of gold, silver, copper, and zinc ore was, to some measure, compensated by increases in manganese and pyrite. That centre endeavors, with more or less right, to claim the molybdenite deposits at Climax on the crest of the Continental Range a few miles north of Leadville, coming forward in 1918 with a large production. Boulder county suffered from the set-back given tungsten; so, while

SOURCE OF WATER SUPPLY OF COLORADO POWER CO. AT NEDERLAND. THE GENERATING PLANT FURNISHES POWER TO MINES IN BOULDER COUNTY AND TO DENVER.

the market for this product was low, miners turned their attention to the districts in which silver had proved attractive in former years, with the result that several encouraging discoveries of this metal were made in the county.

The persistence of good ore at depth is proved in all cases of deep exploitation within the Cripple Creek district. The latest proof of such is on the 21st level of the Portland mine, in the Lee claim. Here, a bulk sample taken across 5-ft. vein, assayed 14 oz. gold per ton. In this instance it was found that, on screening the same ore, the fine carried much less than the crude, or a little better than 4 oz. gold per ton. The present condition of this district warrants optimism.

Speaking of labor conditions, the public was, early in January, informed by the press that the Colorado Fuel & Iron Co., one of the largest employers in this State, would immediately reduce wages because the War is over. J. F. Welborn, president of the company, has announced that no reduction in wages has been contemplated, that his company hopes wages will remain at their present level and that, if there is a general tendency to lower wages in the country, this company will not act in such a reduction without a conference with its employees' representatives.

Feeling that the metal-mining industry of Colorado has not been receiving the support it deserves from the State as a whole, the Colorado Metal Mining Association and the Colorado Chapter of the American Mining Congress are endeavoring to stimulate more interest therein by a bill introduced in both houses of the Legislature calling for the creation of a mining survey. For years past it seems that the agricultural and manufacturing interests of the State have dominated in the passage of legislative acts, and have been awarded an undue amount of State support, at the neglect of the primary industry of Colorado. If these new bills become law we shall have a metal-mining survey organized, this to be in charge of a commission of men directly interested in mining, but who will serve without compensation. It is provided that no appropriations will be required from the treasury, but that the survey will be maintained by the levy of a tax (one-half of 1% has been proposed) on the gross proceeds of all metalliferous ores mined, this tax to be collected by county commissioners and turned over by them to the Treasurer who will act simply as agent or custodian of the funds. The income from such a tax will be bountiful, and will be utilized to make "investigations regarding the prospecting for, mining, production, transportation, buying, selling and treatment or reduction of metalliferous ores as well as economic conditions relating thereto. * * * The directors shall have power and authority to examine all books and records of all producers, dealers or ore-purchasing agencies insofar as they relate to production, sale, transfer or purchase of ore."

In the 'Press' of January 4, a brief history of great things projected years ago in the Encampment region of southern Wyoming was published. It is rumored here that the publicity given by this description is responsible for an effort being made to secure from bondholders the assets of the several related defunct companies by Denver interests that propose either to junk the numerous plants, aerial tram, and town, or to rehabilitate the projects and place them in operation [Details were given in our issue of February 1. —Editor.]

Right on the heels of disheartening news that two large oil companies had drilled deep holes at Boulder, and had pulled up their outfits with a view of permanent abandonment of the field, comes the news that two other large companies are moving rigs into a wildcat region in T. 11 N., R. 69 W., which is close to the Wyoming line in Larimer county, where geologists have outlined a well-defined structure in which oil may exist at a depth of from 1200 to 1400 ft. Maybe we shall yet discover another oilfield in Colorado.

COBALT, ONTARIO

Developments in the Silver Mines.

The most important development at Cobalt for some time has been the opening of a new and rich vein recently discovered on the 200-ft. level of the Crown Reserve. For 100 ft. it maintains an average width of 3 in. and carries 3000 oz. per ton. A large quantity has been sacked.

The McKinley-Darragh continues to produce sufficient silver to maintain the quarterly dividend of 3%. At the flotation mill, which is closed for the winter, better equipment is being erected.

At the Adanac, high-grade ore is being broken in a raise driven above the 310-ft. level. The mineralized section of the vein is 2 ft. wide.

In the Nipissing, a new stope, which will have a length of 125 ft., is being started on a vein on the 4th level near 98 shaft. On January 2 the company had cash assets totaling $3,898,711. Cash amounted to $2,545,063.

The annual report of the Coniagas for the year ended October 31 shows an output of 974,264 oz. of silver, compared with 1,344,267 oz. during the preceding year. The combined sales of ore and profits of the Reduction company aggregated $4,099,490, against $4,256,597 in 1917. The profits were $470,164. The president, R. W. Leonard, reports that the future output depends more than ever on the low-grade ore concentrated in the mill, and estimates that a three years' supply of this will be available.

The Temiskaming was obliged to lay-off a large number of men owing to a shortage in the power supply. This also affected some other mines at which large auxiliary compressor plants were put in operation.

At the Violet property of La Rose Consolidated an orebody opened at the 470-ft. level shows considerable enrichment over the silver content at the 370-ft. level.

At Gowganda a cobalt-diabase vein with good silver content has been cut on the 350-ft. level of the Castle mine, which is under option to the Trethewey of Cobalt.

Gowganda.—Companies operating in this silver district want transportation facilities improved. A railway from Elk Lake would solve the problem and reduce charges. Coal sells at $14 per ton at rail, but when hauled to Gowganda the price is $44. If nothing is done, then only the richest ore can be shipped, thus retarding development.

LEADVILLE, COLORADO

Notes on the Carbonate of Zinc Ores.

The oxidized zinc ores of Leadville are discussed by G. F. Loughlin in Bulletin 681 of the U. S. Geological Survey. The discovery of these deposits in 1910 and the reason why they had been overlooked so long is covered in the introduction. Most of this ore has come from a body in Carbonate hill, extending through claims controlled by the Western Mining Co. and a few adjoining claims. From 1910 to 1916, inclusive, there was mined a total of 651,492 tons of oxide and 840,243 tons of sulphide ores, carrying much the same percentage of zinc, say from 21 to 31%. The mineralogy and occurrence is then fully discussed, concluding with a note on prospecting. The area covered by the numerous and extensive oxidized lead-silver stopes in the district, extending from the western edge of the Down Town section eastward to Ball mountain, and from Fryer hill southward to Rock hill, is legitimate prospecting ground for oxidized zinc ores; but it remains for those most familiar with the details of individual mines or claims to formulate the best methods of prospecting. Furthermore, especially where ground has been abandoned for a long time and detailed knowledge of it is slight, prospectors should be ever on the lookout for new and unexpected evidence, and should modify their methods accordingly.

THE MINING SUMMARY

ALASKA

Anchorage.—On February 8, the Secretary of the Interior at Washington asked Congress for $13,800,000 to complete the Government railroad. It will take three years to complete the line, according to the Alaskan Engineering Commission The total cost will be $44,800,000, instead of the original estimate of $35,000,000. At present there is plenty of labor and rails available. The chairman of the Commission, W. C. Edes, states that it is desirable that the line be completed as early as possible. Agriculture and mining in the Tanana and Yukon valleys will be greatly stimulated and the settlement of the country advanced. The prospector will be afforded easier access to the great undeveloped country in the Broad Pass and adjacent regions. Access to Mt. McKinley National Park will be easy. The through freight and passenger travel from Seward to the interior will undoubtedly be one of the main sources of revenue to the railroad. The great interior of Alaska, which has produced so much gold and minerals in the past, and which will undoubtedly produce much more in the future when the working expenses are reduced, is entitled to cheaper and more reliable transportation, and the completion of the railroad will afford this according to Mr. Edes.

Juneau.—Alaska Gastineau in January treated 151,515 tons of 78.7-cent ore. The recovery was 76.87%, leaving 18.2 cents in the tailing. In December the output was 117,310 tons of 98.3-cent ore.

ARIZONA

Douglas.—Copper output of the Phelps Dodge properties in January totaled 11,818,733 lb. A year ago it was 21,766,836 pounds.

Globe.—The Cole-Goodwin mine near here, formerly operated by the Cole Development Co., and recently examined by G. M. Butler, dean of the College of Mines at Tucson, is being equipped for extensive development of the large bodies of low-grade copper ores disclosed.

Humboldt.—The Consolidated Arizona Smelting Co. has started to reduce its force at the Humboldt plant. The Blue Bell and DeSoto mines are not affected so far.

Jerome.—United Verde Copper Co. paid a dividend of $1.50 per share, equal to $450,000, last week. This is the first distribution since July 1918.

Following the reduction of wages in this centre a general strike has been started.

Miami.—Copper output of the Miami Copper Co. in January was 5,273,260 lb., an increase of nearly 300,000 lb. over December. This company, with the Inspiration Consolidated, have reduced wages from $5.90 to $5.15 per day, based on 20-cent copper. If the price is 18 cents, wages will be lowered to the minimum of $4.90. The Old Dominion company at Globe has acted similarly.

Ray.—Copper output of Ray Consolidated in January was 4,470,000 lb., a decrease of 1,330,000 pounds.

Superior.—The Silver King is to start sinking a 1000-ft. shaft as soon as machinery can be placed and other arrangements made.

Tucson.—A five-year lease and option on the El Tiro mine in the Silver Bell district has been taken by Percy Williams, who has operated it profitably and is forming a leasing company to work it. The property was recently purchased from the receiver by Mr. Williams as trustee for the bondholders. A good part of the funds for this purchase was derived from royalties paid for shipments made during the past year. Approximately $95,000 was received from the Sasco and Hayden smelters for copper ore taken out during development in 1918. As the property is on the railroad and is well equipped, it has been in a position to produce copper at a much lower cost than most other small producers. Mr. Williams' plans for development under the new company include the completion of a haulage tunnel by driving 550 feet.

It is reported that the Twin-Buttes Extension Mining Company is arranging to start extensive drilling of its property, which adjoins the Magnate property in the Twin-Buttes district.

Wickenburg. The mining and milling machinery of the Alvarado, Congress, and Rincon mills, valued at more than $1,000,000, is being dismantled for auction.

CALIFORNIA

Kennett.—The Mammoth Copper Co. has not yet reduced its output or wages. The general manager, George W. Metcalfe, said last week: "We have not made any move to reduce production, but there is one thing certain: the company is not making money under present conditions. The cost of production is as great as ever., There has been no market since December 6, and on that date copper was selling at 26 cents. I received the first quotation since that date on February 7 in a telegram from New York. The quotation was 18¾ cents. When copper was going up, the company made several advances in wages paid to its employees. The present wage-scale was adjusted on a basis of 30 cents for copper. The company is up against a hard proposition. What will be done I cannot prophesy."

The Shasta King mine, one of the Mammoth's producing properties, will be closed down in a few days. This mine employed 100 men a few months ago, but for the last month employed only thirty.

Oroville.—It is reported here that the north fork of the Feather river is being investigated at Big Bend. This part of the river is 13 miles long, and it is proposed, as has been suggested for years, to divert the river and recover the gold from the bed. Negotiations are to be made with the Great Western Power Co., which controls some of the land there.

Plymouth.—The Plymouth Consolidated during December treated 10,800 tons of ore, yielding gold worth $60,900. Operations cost $37,900, equal to $3.51 per ton. The net profit, after paying for other charges, was $12,900. On the 2450-ft. level the north foot-wall drift is out 389 ft., the last 9 ft. assaying $10.20 per ton across 8 ft. A south drift of east north foot-wall drift assays $4.61 across 4 ft. A raise yields $12 for a width of 7 feet.

Redding.—The deed transferring 107 acres of dredging ground across the river from Redding to the American Gold Dredging Co. was filed for record last week. Mrs. Rhoda B. Menzel received $107,000, or $1000 per acre. The deal was made a year ago, but the final payment has just been made. The company has been operating a boat on the ground for six months.

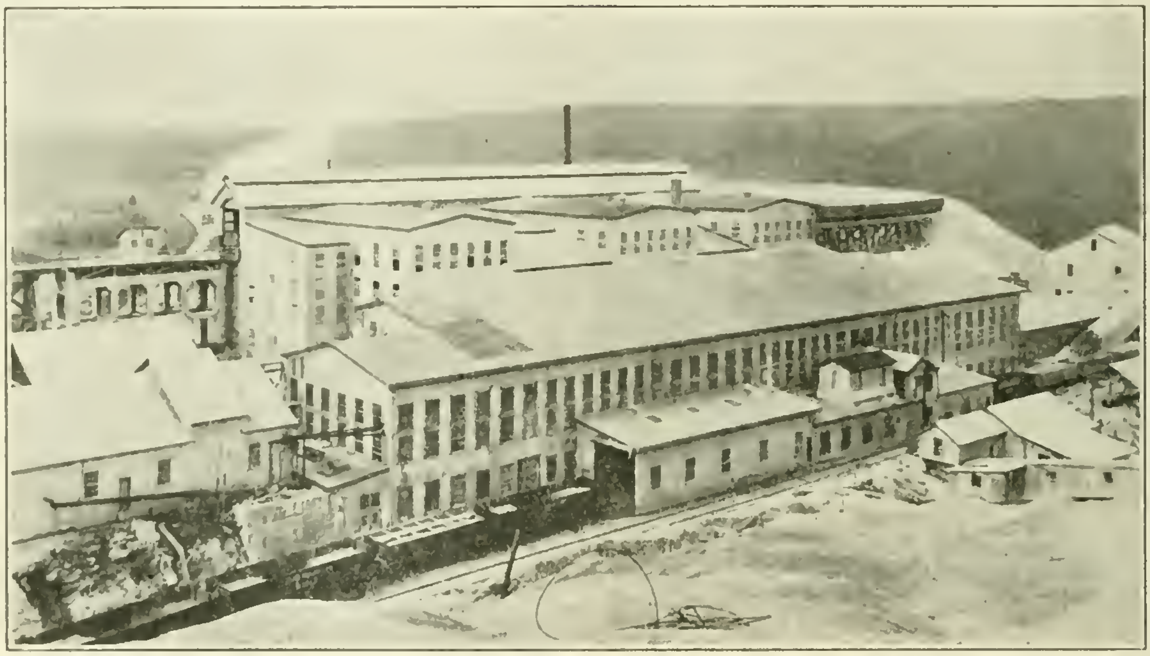
COLORADO

Cripple Creek.—Cresson Consolidated paid dividend No. 76, of 10 cents per share, equal to $122,000, on February 10. This makes $244,000 for 1919, and $7,353,163 to date.

Telluride.—This district shipped 5250 tons of ore and concentrate during December. Of this, the Tomboy accounted for 1400 tons. A circular issued by the company in London on January 10 states that an oil-flotation plant is to be erected at once, to cost $150,000. It is estimated that at least $1 per ton more can be saved, giving an additional profit of $12,500 per month.

IDAHO

Boise.—In a bill before the Legislature it is proposed to establish a State bureau of mines and geology at the University of Idaho at Moscow. An appropriation of $30,000 is asked, $15,000 for co-operation with the U. S. Bureau of Mines, $10,000 for co-operation in topography and hydrography with the U. S. Geological Survey, and $5000 for an economic and geologic investigation of the mineral resources of the State. F. A. Hanson, dean of the School of Mines at Moscow, has great hopes of the measure passing this session.



NO. 3 MILL OF THE ST. JOSEPH LEAD CO., AT ELVINO, MISSOURI

The Idaho Mining Association met here on February 11, well representing the mining industry of the State. Some first-aid contests were held, and interesting addresses were read and discussed.

Mullan.—The National Copper company's mill is concentrating 300 tons of ore daily. During January, 13 cars of concentrates was dispatched, assaying 15% copper and 40 oz. silver per ton.

MICHIGAN

Houghton.—The Hancock mine was closed on February 7, letting out 200 men. It costs this company 22 cents per pound to produce copper, which results in a loss at present price.

The Winona has also suspended operations. About 200 were employed.

MISSOURI

Bonne Terre.—The St. Louis correspondent of 'The American Metal Market' recently wrote as follows: The lead market continues dull and featureless, with offerings light, but the demand is so small that the feeling continues weak. Producers continue to reduce their output, and the Desloge Consolidated Lead Co. is seriously considering the idea of closing down its plants altogether. The labor situation is no longer acute and weather conditions are favorable to a large output of ore, but many mines are closed down, and others are on part time, keeping production low. Some of the producers say that they are running at a loss, but others deny this, and say that they still are able to operate at a profit, although the present profit is small as compared with their war time profits. The movement is light, but is larger than it was a year ago. Receipts of lead at St. Louis last week were 18,760 pigs, compared with 39,010 pigs for the preceding week, and 8740 pigs for the corresponding week last year. Shipments for the week were 43,850 pigs, against 59,200 pigs for the preceding week, and 19,770 pigs a year ago.

The St. Joseph Lead Co., the largest producer in America, has reduced mining and treatment operations to 60% of capacity.

Joplin.—Production of the Tri-State region last week totaled 7839 tons of blende and 995 tons of lead, averaging $41 and $55 per ton, respectively.

It is proposed to organize a community drilling corporation to develop lands in the Webb City-Carterville, Duenweg, Oronogo, and Neck City districts. It is proposed that royalties payable to the land-owners shall be based on mill recovery alone, that is, if 3, 4, 5, or 6% is recovered the royalty will equal these figures.

MONTANA

Butte.—Wages at Butte were reduced $1 per shift on February 7. This includes the reduction works at Anaconda and Great Falls. This is the outcome of the conference of Union delegates and the Secretary of Labor at Washington.

Anaconda produced only 15,900,000 lb. of copper in

January, a reduction of six million pounds from December.

On February 7 two mass-meetings called by the I. W. W. were attended by several thousand miners, who adopted prepared resolutions calling for a general strike at Butte. Speakers who addressed the meetings declared that the recently announced wage cut of $1 per day was a challenge to the "workers to start the class war." It was announced that an attempt would be made immediately to close all industries in the city, including restaurants, theatres, stores, and barber shops. Another mass-meeting of miners was called for the 8th. A committee appointed on the previous day drafted demands to be made on the mining companies, and to be presented to the strikers on the following day. While the day shifts showed almost full forces, except at the Elm Orlu mine, where 250 men walked out on the 7th, the evening reports show that 1400 men of the Anaconda alone failed to go underground and several mines are virtually closed. The men who quit work were for the most part Finns. No other properties in the district were affected and all of these mines report normal shifts at work. None of the companies as yet has received demands from trade unions affected by the wage reduction. A few men who gathered at the collar of the Elm Orlu shaft at 8 o'clock on the 8th with the evident intention of working, were jeered by the strikers and not permitted to go on the job. There was no disorder at the mines and no arrests have been made or guards stationed.

By Saturday night there was almost a general strike at Butte. According to a statement from the secretary of the local I. W. W. organization, the demands of the strikers also include a six-hour day with pay at the rate of $1 per hour, and abolition of the rustling card system, and the I. W. W. is in sympathy with the Seattle strike.

The new wage is $4.75 for miners, which is 50 cents above the schedule in existence at Butte for years. Shaftmen are reduced to $5.25, and mechanics to $5.50.

The East Butte company yielded 2,291,950 lb. of copper in January, a gain of 370,000 lb. over December.

Troy.—The Snowstorm Mines Consolidated in 1918 made an operating profit of $129,792 and a net profit of $47,314, after deducting taxes, insurance, boarding-house loss, interest, and exploration. Current assets total $42,562 and liabilities $101,581. The mill dressed 65,342 tons of ore, yielding the following:

Lead concentrate, tons	5,093
Lead content, pounds	5,864,174
Silver, ounces	126,077
Gold, ounces	561
Zinc concentrate, tons	3,641
Zinc, pounds	2,474,969
Lead, pounds	1,196,310
Silver, ounces	38,528

The Snowstorm mill is treating ore at the rate of 6000 tons per month. The new tunnel is in 1200 ft. Plenty of miners are available.

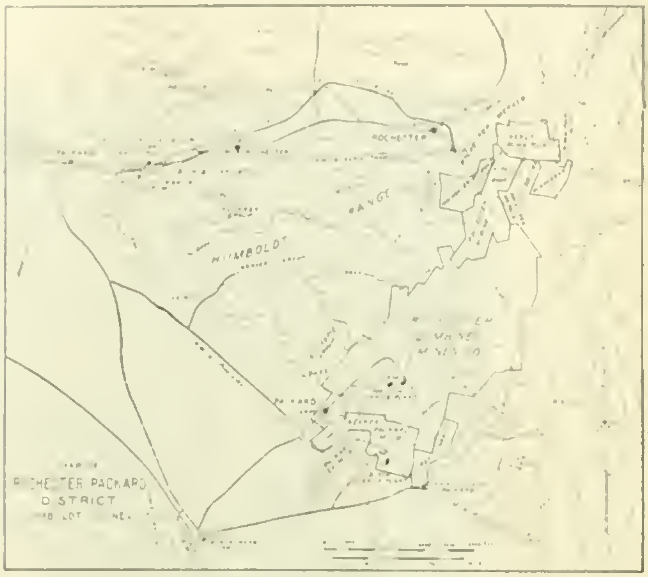
NEVADA

Belmont.—In caarge of Jay A. Carpenter, the old Monitor Belmont silver mine is being re-opened for the Nevada Wonder company. Air-lifts and bailers have lowered the water in the workings to 400 ft. below the collar of the vertical shaft. The vein has a dip of 45°, so a large area is opened for exploration. There were no plans of the mine, parts of which have been flooded for 50 years. Drifts are blocked with cave-ins. The old-timers extracted the ore fairly well, but had to leave faces that are ore today. It is hoped that enough ore will be found to justify altering the mill.

Ely.—Nevada Consolidated produced 4,400,000 lb. of copper in December, a drop of 1,400,000 pounds.

Goldfield.—The Goldfield Consolidated Mines Co.'s property has been taken over by lease and purchase by the Goldfield Mining Co., represented by H. G. MacMahon of Goldfield, and San Francisco people. A new system of leasing is to be announced. The new company will operate the surface equipment, pumps, etc.

Rochester.—An agreement to consolidate five of the six principal properties in this district, thus terminating litigation pending and threatening, was signed at Reno on February 3 by L. A. Friedman, H. G. Humphrey, and Joseph Nenzel. The companies to be merged are the Rochester Mines, Rochester Combined Mines, Nenzel Crown Point, Elda Fina, and Rochester Merger. Two of these—the second and third named—are equipped with modern mills. The combined area measures over two miles in length and a mile in width, containing considerable silver deposits. The respective owners of the companies have been at cross-purposes for the past two or three years. The agreement provides for dismissal of an apex suit and attachment proceedings against the Rochester Mines, for settlement of terms by February 12, and for reorganization by April 15. The new corporation probably will be known as the Rochester Nevada Silver Mining Co. The agreement was signed through the mediating efforts of Frank M. Manson, of the Western Ore Purchasing Co., who, with Judge French of Reno, is named as a trustee to handle the funds of the companies pending reorganization and to pay off an indebtedness of the Rochester Mines Co. amounting to $60,000.



NEW MEXICO

Santa Rita.—Chino Copper produced 4,421,000 lb. in January, a decrease of 1,201,000 pounds.

TEXAS

Austin.—On February 4, Senator R. M. Dudley of El Paso introduced into the Senate a bill providing for a comprehensive mining law designed to encourage the development of mining in the State. The bill pertains exclusively to mining and eliminates oil, coal, and gas, and makes provision for the sale and operation of mineral deposits. It was patterned largely after the Federal mining law, and was drawn up by several mining engineers of west Texas with the co-operation of the Commissioner of the General Land Office.

UTAH

Bingham.—The Utah Metal & Tunnel Co. has issued a circular explaining settlement of the apex dispute with the Utah Consolidated. The former company has the unrestricted right to follow all beddings of fissures that may be found on the western part of the Bingham-New Haven ground downward extra-laterally, in and under the Utah Con ground without regard to how the apexes of such lime beddings or fissures lie on the Utah Metal. To the east of the Occidental fault, Utah Metal has full mining rights in a strip of ground within the Utah Con., without royalty or any charge, and with privilege of using the workings of Utah Con in carrying on development and mining. Wherever they appear in this area, Utah Metal transfers to Utah Con. all apex-rights and releases them from any claim for damages that it may have by reason of the Utah Con. extracting ore from the two lime-beddings in the past

Last week the Utah Consolidated began suit against the Utah-Apex to settle the matter of title to fissure-veins which apex, according to the complaint, in the Keepapitchinin and Rattle-snake claims. The dip of the veins is to the north, passing through the property of the Utah-Apex, adjoining that of the Utah Consolidated. It is alleged in the complaint that by means of tunnels, cross-cuts, and drifts the Utah-Apex has entered the veins at depth and has extracted ore to the approximate value of $500,000 from each of the veins in dispute. It is claimed by the plaintiff that the alleged ownership of the veins by the Utah-Apex is groundless, and casts a cloud on the title claimed by the Utah Consolidated. In addition to asking that the title to the veins in dispute be established by court, the Utah Consolidated asks for an accounting for the ore alleged to have been illegally extracted. Last October the Utah-Apex brought suit against the Utah Consolidated based on the same grounds as the suit filed last week. This suit was finally compromised.

THE UTAH-APEX LEAD MINE, BINGHAM DISTRICT, UTAH

Utah-Apex has laid-off about 300 men, due to the drop in price of lead.

Utah Copper produced only 10,500,000 lb. in January, a falling-off of 3,335,000 lb. On February 6, wages were reduced 75 cents per shift.

The Bingham Mines and Ohio Copper companies have also made a cut in wages.

The Montana-Bingham mine has suspended work until the metal markets are better. C. G. Ballantine is manager.

Tintic.—Twenty-one mines and leases shipped a total of 667 cars of ore during January, an increase of 133 cars over December. The Dragon dispatched 139, Chief Con. 96, Tintic Standard 92, Iron Blossom 53, and Centennial-Eureka 52.

WASHINGTON

Chewelah.—Stevens county is endeavoring to obtain an appropriation of $150,000 from the Legislature to improve roads into the mining regions. The Columbia section of the A. I. M. E. is backing the request.

The United Copper mine is estimated to contain 123,700 tons of ore below the 1000-ft. level, all of which was developed during 1918. The assay is 1.6% copper and 4.35 oz. silver per ton. Silver increases with depth. It is intended to sink the shaft 700 ft. to the 2000-ft. level.

Leadpoint.—The Electric Point Mining Co. in 1918 shipped 146 cars of ore to Trail, B. C., and 70 cars to Northport. This is a lead-carbonate ore. The income was $242,538, expenses $272,701, and net loss $25,917. Dividends amounted to $87,312. Current assets total $173,541, of which half is cash.

Republic.—The Knob Hill company made a loss of $9216 during 1918. Ore shipments realized $33,933. January shipments were 9 cars of 40 tons each.

CANADA

British Columbia

Silverton.—The superintendent of the Silver-Standard mine, W. G. Norrie-Lowenthal, in announcing the temporary shutting-down of the mine, says: "Our reason for closing down the mine and the mill at this time is purely one of freight-rates and the value of Silver Standard ore and concentrates. The railways, chiefly on the American side where the zinc is shipped, have been altering their rates to such an extent that smelter people are unable to make a settlement until the rates are adjusted. The matter has been up for two or three months, the Silver Standard people hoping all the time that the rates would be satisfactorily adjusted and operations continued at the mine. As yet nothing has been accomplished and it may take another two or three months. The position of the Silver Standard is very simple. They have not yet received a dollar for all the zinc concentrates sent to the smelter on the other side, and no chance of getting any until the rates are adjusted, either for what has been shipped or for what is on hand. To continue operations under the circumstances is out of the question. As for the mine itself, it never was in better shape. There are several shoots of high-grade ore recently opened up. Work at both the mine and the mill has been running satisfactorily. There are on hand 100 tons of zinc concentrates and 72 tons of lead concentrates."

The Standard company reports a surplus of $317,565 at the end of 1918, an increase of $20,000 when compared with November 30.

Ontario

Kirkland Lake.—The Lake Shore Mines, Limited, during the year ended November 30, 1918, made a net profit of $144,978, of which $100,000 was paid in dividends. Milling started in March. The plant treated 14,948 tons of ore averaging $24.76 per ton, yielding gold worth $370,128. In the mine, 80% of all driving was in ore of milling grade. Work is conducted to a depth of 400 ft. R. C. Coffey is manager.

The Teck Hughes Gold Mines produced 2035 tons of $10.12 ore during December.

Porcupine.—The Dome Mines company, after considerable silence, has issued a report covering 9 months ended December 31, 1918. Current assets total $601,089, and liabilities only $11,238. The labor position is much better and will improve. A station was cut on No. 9 level, but no other work has been done there; also one on No. 10, and a loading-station 50 ft. below No. 10, or 1150-ft. level. A drift east was driven at this depth to explore for the zone cut by No. 9 drill-hole. Since December 20 this and three drill stations have been cut along the drift, from which more drilling will be done. Drilling 1435 ft. from No. 8 level resulted in nothing definite. Ore-reserves remain as in the last annual report, namely, 1,950,000 tons worth $5.10 per ton.

Sudbury.—The International Nickel Co. has closed its Crean Hill mine, laying off 800 men. The high-grade ore of the Creighton mine will supply the reduction works.

MEXICO

Mexico City.—Influenza caused the death of 436,200 persons in Mexico during 1918, according to data published by 'El Universal'. This figure is believed to be conservative, according to the paper, as several States were unable to supply figures on the mortality. In others, it is added, the epidemic still prevails. In Morelos, in particular, few families escaped illness. In fact, the influenza is credited with having destroyed the power of Emiliano Zapata, long the rebel ruler of that State.

Chihuahua.—Advices from Mexico City state that more than 300 mining properties confiscated since 1913 are to be returned to their owners, who will be obliged to work them and pay the corresponding taxes under penalty of losing them. Only the properties of ex-governor Creel, of General Tarrazas and sons, and the mine owned in Cusihuiriachic by the late General Orozco are to continue confiscated.

PERSONAL

Note.—The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

S. J. Speak is in Rhodesia.

T. A. Rickard is in New York.

L. D. Ricketts is at Chandler, Arizona.

L. H. Duschak, of the U. S. Bureau of Mines, is at Washington.

P. N. Nissen, now Lieutenant-Colonel, has returned from France to London.

Norman C. Stines was in London recently, on his way from Russia to France.

Frederick G. Cottrell has been awarded the Perkin medal of the Society of Chemical Industry.

J. P. Hutchins sailed from New York on February 17 on his way to the Black Sea region of Russia.

William W. Mein sailed from San Francisco on February 11, on his way from New York to Nicaragua.

John A. Fulton has been appointed superintendent of the Idaho-Maryland property at Grass Valley, California.

John M. Nicol has returned to San Francisco from a lengthy investigation of mining properties in Honduras.

J. M. Wadsworth has resigned from the U. S. Bureau of Mines to enter the employ of the Empire Gas & Fuel Co., with headquarters at Bartlesville, Oklahoma.

J. C. Farrant, London representative of the Hardinge Conical Mill company, has returned to England after having been a prisoner of war in Germany for four years.

Judd Stewart, for 36 years identified with smelting operations in this country, and long connected with the American Smelting & Refining Co., of which he was a director, has tendered his resignation effective March 1.

E. W. Wagy, of the U. S. Bureau of Mines, is investigating the Texas, Louisiana, and Mid-Continent oilfields for the purpose of making a special study of methods used in those districts in the matter of perforating casing and setting screen-pipe.

Obituary

James Cumming, a pioneer of the Canadian West, died at Vancouver, B. C., on December 3. He was prominent in the Cariboo gold rush in 1862.

T. Walter Beam, well known in the West, and more recently from his connection with the re-opening of the Old Eureka mine at Sutter Creek, California, died at Denver on February 1. He was born in Ohio in 1854, going to Colorado in 1871. He leaves a wife, one daughter, and one son.

Alan Fraser McCormick died of pneumonia at El Paso, Texas, on December 23, 1918. He was born in the Province of Ontario, Canada, 43 years ago, and at the time of his death was assistant-superintendent of the El Paso Smelting Works. He began his career in the smelting business about twenty years ago at the smelter at Trail, B. C. From Trail he went with the Granby Consolidated M., S. & P. Co., and subsequently was connected with mining companies in Montana. When the Nevada Consolidated Copper Co.'s smelter was blown-in, Mr. McCormick was assistant to Walter G. Perkins, who was in charge of smelting operations. In 1911 he went to the El Paso Smelting Works as assistant-superintendent in charge of copper reverberatory smelting and converting operations, where he remained until the time of his death.

THE METAL MARKET

METAL PRICES

San Francisco, February 11

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	18.25
Lead, pig, cents per pound	5.25— 6.25
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb.	$95
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	16.00

EASTERN METAL MARKET

(By wire from New York)

February 11.—Copper is quiet and lower. Lead is dull though steady. Spelter is inactive but firmer.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, and on December 13 to 48 7/16 pence.

The Annual Bullion Letter of Samuel Montagu & Co. of London is to hand. It contains a great deal of interesting matter on silver, to be published in this journal later.

In January there was some activity in trade demand for silver in London, but not of sufficient size to incommode the market, deprived, as it has been for some time, of competition from abroad, owing to export restrictions which remain in force.

Silver worth $14,000,000 was sent to the Orient by the 'Colusa' on Saturday, the 8th.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

ORES (New York)

Manganese Alloys: It is the opinion of a leading ore-dealer that there is at present in the United States enough manganese ore and ferro to supply the country's needs for 14 months. The output of ferro in America in December was 23,907 tons, bringing the total for 1918 to 345,306 tons, a record for any year. Demand for ferro or spiegel is light. Only a few carloads of the former have been sold at $175 to $200 per ton delivered. It was nearly all re-sale material. Spiegel is nominal at $60 delivered, for 16 to 18% alloy and $65 for the 19 to 21% material. It can be bought under these levels.

Molybdenum.—The market is regarded as firm at about 90c. to $1 per lb. of 90% concentrate, but it is not active. One statement is to the effect that transactions in January involved about 40 tons.

Tungsten: There has been no change, and quotations are not available in the absence of any test of the market. It is stated that some ferro-tungsten sold at $2 per lb. of contained tungsten.

The War Trade Board announced on January 25 that it received official information from the French High Commission in the United States to the effect that France will be unable, at least until April, to ship potash from the mines of Alsace. Also for the next few months practically the entire potash output of the Alsatian mines will be urgently required for agricultural purposes in France. It is the view of the Board, based upon this information, that even under the most favorable circumstances, no potash from Alsace could be available in the United States for agricultural uses before June 1919, and that, therefore, it will be necessary that this country rely entirely upon its domestic potash production for the coming spring season.

Eastern Metal Market

New York, February 5

All the markets are stagnant and entirely lacking in interest; demand and buying is only spasmodic.

On small sales the copper market continues to decline.

There is no activity in tin, and the market is still held down by restrictions.

The lead market continues to slide, and lower levels have been reached with light buying.

Zinc is still declining on a small volume of transactions, and the position is not strong.

Antimony is slightly easier.

ANTIMONY

Demand is poor and the market is quiet. Prices are a little lower with wholesale lots for early delivery quoted at 7.37½ to 7.50c., duty paid, New York.

COPPER

Copper buying has been and still is on a small scale; this is generally admitted. One statement is to the effect that not more than two days' production of copper has been sold since the armistice (November 11). Another holds that the sales in January have not been over 24,000,000 lb., and that there is not any market in the broad sense. Production has been curtailed decidedly, an illustration being that for Anaconda in January which fell off about 6,000,000 lb. from that in December—the lowest month's output since September 1917. On small sales and a fair demand the market has gradually eased off until electrolytic copper for early delivery has sold as low as 18.75c., New York. There are numerous sellers at this level, which we quote as the market. Lake copper is slightly higher and nominal at 19.50c., New York. Considerable interest attaches to the outcome of the conference with miners at Washington as to a resumption of the sliding-scale of wages. [In The Mining Summary will be found what is happening at all the principal copper centres.]

IRON AND STEEL

There are still no signs of any buying movement from domestic or foreign sources. Further moderate reductions in ocean freights are an aid in the export field, but transportation costs are still four to five times the former normal charges. According to cable information from London the German steel output in 1918 was about 16,500,000 metric tons, nearly the same as that in 1917. The pig-iron output of the United States in January was 3,302,260 tons, which establishes a record for that month, although there were 27 less furnaces in blast at the end than at the beginning of the month. The daily output was 106,525 tons, against 110,762 tons in December. The combined output of manganese alloys in January was 32,787 tons, compared with 49,435 tons in December; it was the smallest of any month since February 1917, when it was 26,114 tons.

LEAD

The lead market continues to decline and it is uncertain yet whether the bottom has been reached. Last Friday, January 31, the American Smelting & Refining Co. reduced its price from 5.50 to 5.25c. per lb., New York, or to 4.95c., St. Louis. It has thus far been of little avail. Independents have met this and gone one better until today lead is quoted at 5.05c., New York, or 4.75c., St. Louis, for early delivery. As low as 5c., New York, has been done, but it was of a special nature. The market is generally quotable at 5.05c., New York, or 4.75c., St. Louis, with demand light. Some regard the price as attractive, and feel that though it may go lower the turn in the market is likely any day. Considerable depends on demand from all other consumers of lead who have been slow to assert themselves. At present levels more interest is reported as being shown by buyers, and a good demand is regarded as possible.

TIN

With the War over nearly three months, and with all other markets free and open in every respect, the tin market continues under restrictions. No imports nor buying for future delivery are possible, although the metal is purchasable at about 20c. under the present controlled price. How long such a condition is to prevail is disconcerting. The market is demoralized, slow and stale, and there is no buying except for the direst needs. It is understood that only about one-third of the metal allocated to the United States Steel Products Co. has been absorbed. The price for this is 72.50c., New York. American tin (from foreign ore) can be bought at 67 to 68c. per lb., New York. An interesting rumor is to the effect that purchasing for shipment from the Far East may be attempted on the assumption that by the time such shipments could reach the United States import restrictions may have been lifted; if not, such metal could be held in England until it could be imported into this country. The arrivals of tin in January were only 1900 tons, of which 1850 tons came through Pacific ports. In January 1918 there were 4912 tons.

ZINC

On one or two occasions recently it has been thought that the bottom of the market had been reached, but the decline has continued another week until today prime Western for early delivery is quoted at 6.35c., St. Louis, or 6.70c., New York, at which level sales of small quantities have been made. The market is very slow, and the present price level regarded as under the cost of production. Some producers are either not quoting or are taking what loss is necessary and contemplating shutting-down at the same time. The report of the Government for the week ended January 18 shows stocks of all grades of zinc to have increased nearly 2900 tons, with a decrease in output of 150 tons. Weekly reports of stocks will no longer be issued, as certain companies refuse to give further returns; the reports of output may continue.

COPPER NOTES

Copper stocks in this country, according to a statement issued by the conference of Union representatives at Washington last week, amount to 1,000,000,000 lb., that is, in all stages from mill to refinery. In addition to this are the large quantities held by manufacturers and the various Allied governments, perhaps a total of 400,000,000 lb. Sales for 75 days did not amount to 5% of the output. Production in 1918 averaged 200,000,000 lb. per month, against 125,000,000 lb. in the pre-war years.

The following comparison of war basis of wages as recently paid with the normal sliding-scale, was prepared at the conference:

Price and place	War basis	Sliding-scale
26-cent copper at Butte	$5.75	$5.00
20-cent copper at Butte	5.00	4.50
18-cent copper at Butte	4.75	4.25
26-cent copper at Clifton	5.00	4.00
20-cent copper at Clifton	4.25	3.25
18-cent copper at Clifton	4.00	3.00
26-cent copper at Globe, Miami, and Jerome	5.90	5.15
20-cent copper at Globe, Miami, and Jerome	5.15	4.40
18-cent copper at Globe, Miami, and Jerome	4.90	4.15
26-cent copper at Bisbee	6.05	5.30
20-cent copper at Bisbee	5.25	4.50
18-cent copper at Bisbee	5.00	4.25

Book Reviews

American Highway Engineers' Handbook. Arthur H. Blanchard, editor-in-chief. Pp. 1579, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $5.

This is by far the most complete handbook that has been published on this relatively new subject. The treatment is in fact so complete that it might almost be used as a text-book. The book is divided into 29 sections, each written by a specialist on the particular subjects treated. At the end of each section is a bibliography. The first section is devoted to definitions, most of them based on accepted standards, and constituting a complete dictionary of highway engineering. The second section treats briefly mathematics, mechanics, and the structural materials used in highway work The third section, on engineering geology, covers rocks, soils, physical geology, the use of maps, and quarrying Preliminary plans and surveys are considered in the next four sections, the special titles being preliminary investigations, surveys and office practice, planning of ròads and road systems, and planning of streets and street systems The section of surveys contains a number of tables, including some curve-tables arranged particularly for use in highway work. The next section deals with grading, drainage, and foundations. The various types of roads and road surfaces are then discussed in detail, earth and sand-clay roads, gravel roads, broken-stone roads, bituminous materials, dust prevention, bituminous surfaces, bituminous-macadam pavements, bituminous-concrete pavements, sheet-asphalt and rock-asphalt pavements, wood-block pavements, stone-block pavements, brick pavements, and cement-concrete pavements, each being given a section. The remaining sections are devoted to various miscellaneous subjects, including street cleaning, collection and disposal of waste, and snow removal; car-tracks and pipe systems; comparison of types of roads and pavements; sidewalks, curbs, gutters, and highway signs; highway bridges, culverts, retaining-walls, foundations, and guard-rails; preservation of materials used in highway structures; financing of highway improvements; and organization and administration of highway departments. In their zeal to make the book comprehensive, the authors and the editor have occasionally erred on the side of being prolix, and there is also considerable repetition, most of it unavoidable if the general plan of the book were to be followed. Nevertheless, the book will be of great value to highway engineers and others engaged in street and road construction.

Heaton's Annual for 1919. Pp. 512, ill., index. Heaton's Agency, Toronto, Ontario, 1919. For sale by 'Mining and Scientific Press.' Price, $1.50.

The fifteenth edition of Heaton's Annual—Commercial Handbook of Canada—has been received. As usual we notice important new features: The clear-cut commercial maps of each Province are new and add greatly to the value of the descriptions of towns. A complete educational guide with illustrated announcements of the leading universities and schools of Canada is interesting and valuable; but this edition is chiefly remarkable for the section on Natural Resources, covering agriculture, fisheries, forest products, fur trade, mining, and water-power, with cross references to the special Government publications from which complete information can be obtained. This section alone is worth the price of the book. A chapter on the war record of Canada will be useful for all time. The Annual is known as the standard authority on the customs tariffs and regulations There is a valuable set of exchange and commercial tables at the end of the book. The clear side-heads and alphabetical arrangements make this a valuable book of reference.

American Methods in Foreign Trade. A guide to export selling policy. By George C. Vedder. Pp. 204, index. McGraw-Hill Book Co., New York, 1919. For sale by 'Mining and Scientific Press'. Price, $2.

This is one of the latest American publications dealing with foreign business and contains many suggestions of value to exporters, especially to those just beginning to enter foreign markets. The author, with a knowledge gained from practical experience, has briefly set forth what he considers the fundamentals of export policies. While many experienced exporters will not agree with some of his conclusions, all will agree that he has succeeded in placing clearly before the reader many suggestions of real practical value. Much of the information contained in his book can be found elsewhere, but most of it is worthy of reiteration, especially when presented in such an attractive style. The author is firm in his convictions and his style is vigorous and pleasing. He has divided the subject into chapters that are crisp, brief, and to the point. Altogether it is a book that offers many helpful suggestions to the established exporter and is at the same time full of valuable advice to the beginner. H. S.

Electric Welding. By Douglas T. Hamilton and Erik Oberg. Pp. 283, ill., index. The Industrial Press, New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $2.50.

Although the first experiments in resistance-welding were made in 1886 by Elihu Thomson, the great development in both types of electric welding is a matter of the past few years, and particularly of the past year because of the tremendous activity in shipbuilding, where electric welding seems likely to supplant riveting to a considerable extent, if not entirely. The present volume is the most complete on the subject that has yet appeared. Two chapters are devoted to butt-welding including a discussion of special machines and processes. Spot-welding is next considered, and it will be a surprise to many people to learn that plates ⅞ in. thick have been spot-welding. Seam-welding and riveting are compared in the next chapter. Percussion welding and electric soldering are then considered in turn. The last three chapters are devoted to electric-arc welding and cutting, including a comparison with similar work done by the oxy-acetylene torch. The book will be of value to anyone interested in welding, electric or otherwise.

Practical Oil Geology. By Dorsey Hager. Third edition. Pp. 243, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $2.50.

An edition every two years seems to be the settled rule for this useful handbook. The present edition has been thoroughly revised and considerable new material added to bring it up to date. The general arrangement, however, is the same as in the earlier editions. The chapter-headings are: Origin and Accumulation of Petroleum; Physical and Chemical Properties; Stratigraphy; Structural Geology; Prospecting and Mapping; Locating Drill-Hole Sites; Oil-Well Drilling; Oil Production; Water; Gas; Oil-Shales; Geological Field Methods and Instruments. The book will be of value to anyone interested in the oil business, from prospecting to production.

'The Genesis of the Ores at Tonopah, Nevada,' is the title of Prof. Paper 104 of the Geological Survey.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

POWDERED COAL AS A SUBSTITUTE FOR FUEL-OIL

For most of the past two or three years, the consumption of Californian fuel-oil has exceeded production to an alarming extent. Recently, consumption has decreased slightly, partly because a number of former users of fuel-oil have adopted coal, and partly because many of the less essential industries have been compelled to get along on reduced deliveries of oil. At the same time, the flush output of one new field has increased production. The result has been that, for the time being at least, production and consumption are approximately equal. However, the less-essential industries cannot be expected meekly to take what is given to them after peace is declared. At the same time the demand for Californian lubricants is increasing rapidly, and the refineries are taking an increasingly large amount of the oil formerly burned in a crude state. Users of Californian fuel-oil must expect higher prices in the future and increased difficulty ot obtaining supplies, and it behooves them to investigate other possible fuels.

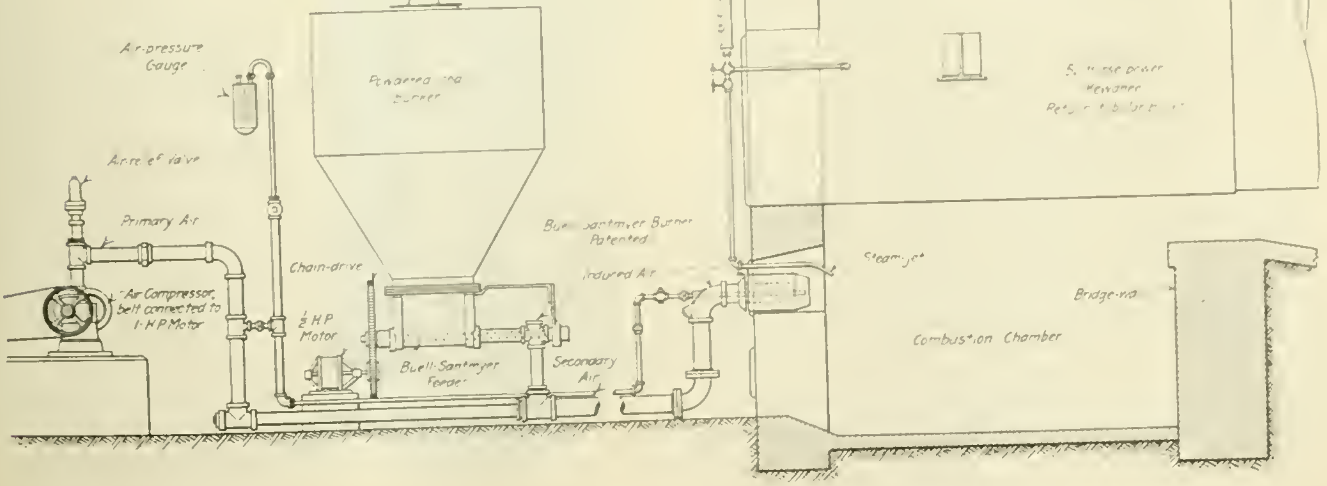
The lignites and semi-bituminous coals of California and other Pacific Coast States are poor fuels when burned in the lump state. Experiments with powdered fuel were made more than thirty years ago, both in the West and in other parts of the country, but the early results were not satisfactory. The processes now in use, however, are economical and efficient. The greatest advance in the use of powdered coal has been made in the cement industry. At the present time nearly 90% of the cement produced in the United States is made with powdered coal. Powdered coal is also being employed in metallurgical work and many other uses, and has even been tried with good results for firing locomotives, and, in one case, for ship propulsion.

The estimated available supply of lignite 'in sight' in California is 35,000,000 tons, divided as follows: Stone Canyon, 6,000,000; Tesla, 10,000,000; Ione, 10,000,000; Dos Rios, 6,000,000; and miscellaneous sources, 3,000,000 tons. It is probable that the total that can be obtained is considerably more than this amount. With the co-operation of officials of the Bureau of Mines, and of J. M. Wadsworth, of the Federal Fuel Administration, R. N. Buell, one of the patentees of the Buell-Santmyer system for using powdered coal, has been making some experiments with Western lignites, employing a disused boiler-plant at 330 Eleventh street, San Francisco. These experiments indicate that, at the present prices of both fuels, powdered coal is at least 10% cheaper than oil on the basis of pounds of water evaporated.

Lignite from Ione, California, is one of the fuels used in these experiments. The following analysis is a fair sample:

	As received	Dry
Moisture	22.44%	0.00%
Ash	14.78%	19.08%
Volatile matter	42.37%	54.60%
Fixed carbon	20.41%	26.32%
Sulphur	2.98%	3.85%
B.t.u. per pound	9322	12,016

The fuel is dried in a Ruggles drier. While good results can be obtained with as much as 6% moisture, it is better to reduce the moisture to 3%. A Williams crusher and a Raymond pulverizer are used to bring the coal to such a fineness that 90% will pass a 200-mesh sieve. Fineness of grinding is desirable, since it assists combustion. The pulverized coal is then transported in closed receptacles to the storage-bunker at the furnaces. No trouble has been experienced either here or at Seattle with explosives or spontaneous combustion. It is advisable, however, to see



GENERAL LAY-OUT OF EXPERIMENTAL PLANT USING BUELL-SANTMYER SYSTEM that the temperature of the coal is kept low, and that no conveying or other apparatus be used such that friction might create a spark.

Several good-sized commercial plants using the Buell-Santmyer system are in operation at Seattle, the largest being the Western Avenue plant of the Puget Sound Tramway Co. with a capacity of several thousand horse-power. There is also a 2500-hp. plant at a coal mine near Seattle, which supplies electric energy to several nearby industries. In all about 100 boilers, ranging from 100 to 600 hp., in Seattle are fired by powdered coal. Most of these plants used fuel-oil formerly.

The general lay-out of the experimental plant at San Francisco, which is typical of any plant using this system, is shown in the accompanying sketch. The fuel supply is regulated by a screw-feed. The combination of the coal and air takes place in a specially designed mixing-chamber. If desired, the bunker and mixing-chamber may be placed at a considerable distance from the boiler, and the fuel conveyed by means of a 'booster' service, without danger of separation or of clogging the pipes. In all, about 15% of excess air over that required for complete combustion is used. Where maximum combustion and consequently minimum length of flame is required, about 40% of the air is forced and the remainder induced. These proportions can be altered so as to give almost any length of flame desired.

At the San Francisco plant, using Ione lignite and similar fuels, an evaporation per pound of coal burned of 8.5 to 9.5 lb. of water from and at 212° F. has been obtained. The furnace temperature was 2000° F., the temperature of waste gases, 470° F. The CO_2 reading was 14.4%. The proportion of CO was negligible. Better results than these could probably be obtained with a new plant.

The owner of a small plant will probably find it more economical to purchase his fuel in a pulverized form. Where this is done, the cost of altering an oil-burning plant of two 150-hp. boilers to use pulverized coal will be about $1200, other sizes in proportion. For the larger plants, it would probably be better to construct an entire crushing and drying works. Such an outfit, for a plant using 100 tons per day, would cost, exclusive of building, from $25,000 to $30,000. The cost per ton used would decrease with the capacity of the plant. Thus a plant for preparing 200 tons per day would cost, exclusive of building, $35,000 to $40,000. The cost of processing, from freight car to furnace, will vary from $0.50 to $0.90 per ton. Another way of using the coal is to construct a steam-electric plant at the mine itself and burn the coal there.

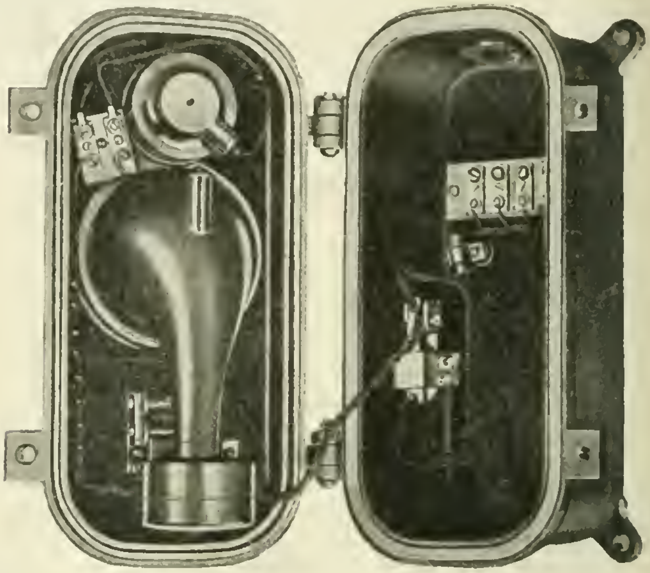
A test was conducted at the San Francisco experimental plant on December 5 in the presence of a number of engineers from the San Francisco Bay district. On December 16, at a meeting held at the Engineers' Club under the auspices of the local section of the American Society of Mechanical Engineers, the subject of powdered fuel was discussed by M. C. M. Hatch, of the Locomotive Pulverized Fuel Co., by Mr. Buell, and by several others.—'Metal Trades'.

IMPROVED MINE TELEPHONES

The entrance of the Klaxon Company, makers of 'Klaxon' auto-horns, into the field of inter-communication equipment is of special interest to mine, mill, and smelter operators, since it will afford an improvement over the ordinary mine-telephone for many purposes.

The Stentor Electric Mfg. Co., makers of 'Stentor' loud-speaking telephones, has recently been taken over by the Klaxon Company which will manufacture and distribute the Stentor products in connection with the Klaxon industrial signals through its industrial division with offices in New York. During the War, all of the inter-communication apparatus manufactured by this company was required by the United States government, and announcement of the change was withheld until individual concerns could be supplied. To meet the requirements of our Navy for inter-communication equipment that withstands all weather conditions and can be heard in noisy places, this company developed a transmitter and a receiver that can be heard even under gunfire.

The inter-communication apparatus for mines is fitted with these improved transmitters and receivers. The instruments are enclosed in sturdy, practically unbreakable, weather-proof housings. These need not be opened, as the Klaxon-Stentor loud-speaking telephone transmits messages in so loud and clear a tone that they can be heard at a distance from the instrument itself without the use of ear receivers.



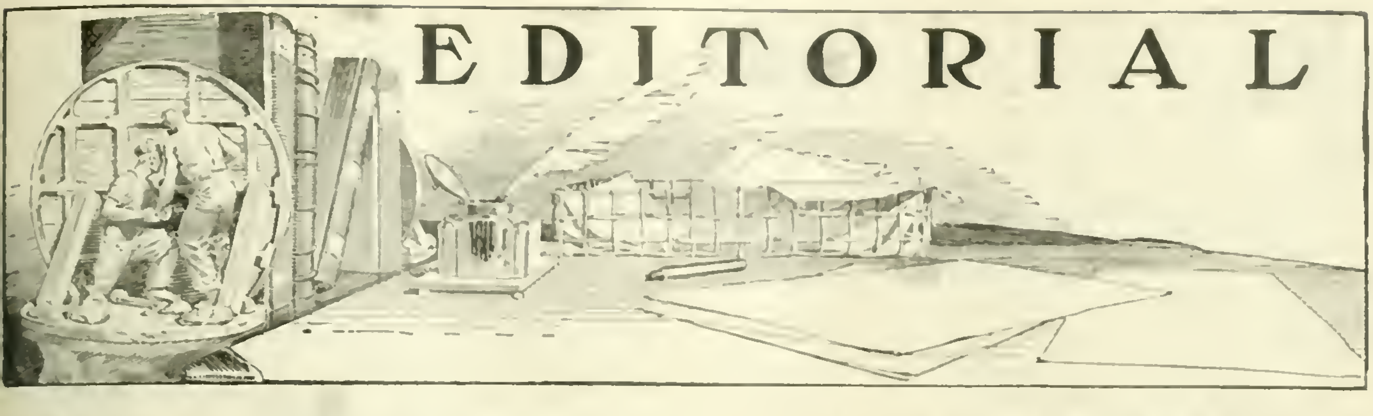
LOUD-SPEAKING MINE TELEPHONE IN CASE

The Klaxon Company was a pioneer in sound reproducing engineering. Klaxon industrial signals are in wide use not only for fire-alarms but also for replacing electric gongs, which must operate under extremely noisy conditions. The Klaxon signal gives a peculiarly raucous far-reaching sound which is readily heard above all the noise of concentrators or stamps and ball-mills.

While the tones of Klaxon-Stentor loud-speaking telephones are in no sense similar to the saw-tooth sounds of Klaxon horns, still their carrying power is developed along the same lines and is equally effective for their purpose.

The Klaxon Company has aggressively entered the inter-communication equipment field, extending its laboratory facilities for experimental research work and engaging several engineers of wide experience in this field to that end. It has employed one of the foremost authorities on telephony and sound reproduction in the United States, and the inventor of the Stentor loud-speaking telephones will devote all his time to development work on inter-communication apparatus. This should be useful in machine-shops.

TELEPHONE CASE CLOSED



SPEAKING of Germany's financial resources we note a letter in the 'Financial Times', of London, from Mr. F. Faithfull Begg, an authority on company finance, at least. He says truly that Germany cannot pay if the Allies ruin her, but he concludes, from careful investigation, that revenues to the amount of 1300 million dollars should be available for the purpose, for which Germany should be called upon to issue indemnity bonds.

OUR Spokane contemporary, the 'Spokesman-Review', has something kind to say concerning the management of the Bunker Hill & Sullivan company, and we are glad to read it. The company has decided not to cut the existing rate of wages, although this was fixed during war-time, when the price of lead was high; nor is the company making any large reduction in its force of workmen, although a suspension of operations might seem justified by the temporary collapse of the metal market. It appears that whereas wages were increased 50% during the War and the wholesale price of living supplies was raised 67%, the local storekeepers have absorbed 10% of this, selling at retail on an increase of 57%. Thus the miners absorb 7% and the retailers 10% of the difference created by the profiteers. In short, the local community shows a fine spirit, justifying the statement made by Mr. F. W. Bradley, the president of the company, "At Kellogg we have a community that stood by us and did not run off to the shipyards, so it is not more than fair that we should stand by it now." We are glad to learn that the Bunker Hill brand of lead is finding a ready market throughout the country.

COMPLAINT is general among those interested in the mines and oilfields of California, that a movement should have been started at Sacramento to re-organize the State government so as to include the administration of minerals along with fish, game, land-settlement, the animal industry, and State fairs, which latter comprise, among other things, jellies, jams, and pumpkin pies. We suppose the close connection between fish and the mineral industry is found in the character of the prospectuses issued by certain promoters, though we were under the impression that the 'blue-sky' laws had required such literature to be written, not in the form of romances, but in a dry statistical style. The relation to deer, ducks, and other undomesticated creatures sought after by the Nimrods is obvious, for who is there in California that has not pursued the mining game? The seemingly incongruous association of jellies, gold mines, wild ducks, copper smelters, hogs, tungsten, and rock cod is not as peculiar as some of our miners seem to think. The war-minerals relief bill, on being introduced recently into the House of Representatives, was referred to the Fisheries Committee, which would indicate some essential connection that the plain man of the hills has failed to grasp. The ways of politicians are past finding out, though there sometimes may be sound reason for their apparent anomalies. It is not many years ago that the legislature of Missouri lumped the State School of Mines with the State Asylum for the Insane in a committee-appointment for investigation. We are glad to know that the California Metal Producers' Association is sending representatives to Sacramento to see to it that the administration of the mineral industry shall be controlled in a manner commensurate with the magnitude of the interests involved. The value of the metal output of California last year exceeded $32,000,000, and that of oil and other substances included among the mineral resources of the State reached $159,000,000.

THE article on the possibilities of re-dredging the gravels of the Oroville district, in California, by Mr. Charles H. Thurman, which we publish this week, will create wide interest. Oroville witnessed the pioneer efforts at gold recovery by this method; many of the problems of dredge-construction for that particular service were there worked out, and the lessons, which have benefited other areas, were in many cases too late for application to the field where they were learned. Mr. Thurman is superintendent of gold dredges in the Feather River Division of the Natomas company's operations, so he speaks from fulness of knowledge. He shows that the earlier work was in many ways imperfect; that the old type of dredge often failed to dig all the gravel available, and that the recovery of gold was below the efficiency now attainable. There are other reasons given for not winning all that might be obtained from the gravels of the Feather River fan. He estimates that considerable portions of the ground may be dredged again, with modern equipment, and made to yield a profit. This will lead to scrutiny of other dredged areas. Incidentally, it is worth while to note that even the latest practice is still wanting in that degree of efficiency which practical men think should be realized, and that serious investigations are under way to correct the heavy losses that are known to take place. It is not unlikely that gold-dredging practice ten years hence will be as far in advance of that now followed as the present methods are superior to those of a decade ago. Despite all the sampling done, it appears that the content of gravel deposits has never yet been accurately determined, although the sampling methods have given results in fairly close accord with the results secured in dredging. No art ever reaches a state of final perfection, and gold-dredging standards change like every other.

Explosives

It is a pleasure to publish in this issue an article on explosives by Mr. Robert S. Lewis. With his customary thoroughness he presents a survey of all the leading explosive compounds now in general industrial and military use. It is a little compendium on the subject. The discussion is most timely on account of the interest in these materials awakened by the War. Important developments have taken place through the creation of new explosives, and it is nearly certain that the progress made will re-act upon the industrial application for blasting operations. A more extended use of tri-nitro-toluene is highly probable, as it is an exceptionally safe explosive, and the growth of by product coking will furnish the basic ingredients in larger amounts than heretofore. It is safe to assume that T.N.T., as it is commonly called, will play a more important rôle in future, despite the fact that the large quantities left in the hands of the Government at the close of the War proved so serious an embarrassment that it was proposed to dump thousands of tons of it into the sea. Actually about 5000 tons, which had been ordered by the French government but not yet shipped, was disposed of in that manner.

Mr. Lewis offers some valuable suggestions regarding the proper application of explosives in blasting, although this phase of the subject might be extended greatly. In the larger operations, especially in the great open-cast 'porphyry' mines, explosives are employed in a highly scientific manner by men of special training. Blasting under such conditions is no longer a matter of mere experience in rule-of-thumb methods; it is a question of the application of mechanical principles to utilize in the most effective manner the work developed by the explosive used under the conditions of the blast. In smaller mines, however, the older rude empirical methods still prevail, and the average miner and foreman, fixed in the habits handed down to them by their predecessors, persistently misapply the giant forces placed in their hands by the manufacturers of explosives. In no department of mining today is a greater waste of energy tolerated than in blasting in the way it is practised in the majority of small and medium-sized mines. Not only is this wastage the result of improper preparation of primers, wrong methods of loading holes, weak exploders, and incorrect ways of adjusting the cap to the fuse, but in an improper estimation of the amount, grade, and rapidity of action of the explosives loaded in order to secure the best results. Hints regarding these points may be gleaned from the instructive article by Mr. Lewis, which we hope will be elaborated later to cover more specifically the problems indicated. We may point out that the manufacturers of explosives themselves are not without a selfish interest in the economical application of their products. One of the great items of cost in mining is the powder used in blasting. If it is judiciously applied to loosen the maximum possible amount of ore or rock it is facilitating the expansion of enterprise; if wrongly, that is, uneconomically used, it is retarding enterprise.

The Business Outlook

In the last five years business has received two hard jolts, one on August 2, 1914, and the other on November 11, 1918. Business as usual, was unprepared. No one anticipated war when it burst without warning upon a stricken world, and no one anticipated peace when Germany's backbone broke with a crash in November last. The two crises are analogous, both in their psychological and physical aspects. The swing of the business pendulum in one direction in the first instance indicates the direction and character of the return swing in the second. In the solution of a mathematical problem, the task is to obtain the expression of an unknown quantity in terms of the known. In this case, the phenomena manifested in the transition from peace to war are the known quantity. These phenomena indicate the probable trend of business as the world gradually assumes a normal aspect. It will be remembered that a tremendous slump occurred during the first months of the War. Shock succeeded shock, and, as a realization of the enormity of the catastrophe broke through the crust of man's understanding, the confidence, the credit, and the actuating power that propelled the wheels of business seemed to dissolve. The slough of despond was filled to overflowing. When Lord Kitchener, in his famous interview with an American journalist, placed three years as the minimum duration of the War, a shudder followed by loud cries of incredulity burst forth from millions of throats. Judge Gary said that the War could not last more than six months, probably more for the purpose of allaying the panic that seized American business than as a real expression of his own mature judgment. It remained for Mr. James Farrell, himself an expert steel-maker and not a financier, to make the prediction that the War would bring about a business boom in the United States. Remember what happened, and the conditions that preceded. From the utter disruption of commercial business outside the United States, the collapse of all commercial export trade, the slump in industrials and mining securities, and no buying in consequence, to the meteoric career of the 'war babies' on Wall Street and the creation of that new species, the munitions millionaire, are all a matter of contemporaneous history, too recent to have been forgotten, crowded as the last four years have been with exciting events. It becomes increasingly evident, as we study the present situation, how strikingly similar the two periods of depression are, the pre-war and post-war periods. There is this difference, however, that while the necessities of war were immediate and resulted in an abnormal pressure to secure production of everything at unheard of speed, the pressure due to the return of commercial business will be less violent, but insistent nevertheless. The rate of increased activity will be steady; it will not produce those overload peaks in the curve; it will be rather a steady ascending line that means economical results as well as increasing quantity production. American industry has been heaving with all its might and main against the stone wall of Germanic military organization for nearly two years. Suddenly that wall collapsed, and we all fell forward in a heap; some of us even barked our shins and skinned our noses. Just now, we are picking ourselves up, dusting our clothes, and taking account of damages, still a little rattled at the suddenness of it all. The Government had just gotten into tune with industry; production of everything was under way at an abnormal rate. Now, the Government is trying to dam the stream it created. Industry is lopping off as fast as it reasonably can, in order that it may get its breath and readjust itself to meet the new conditions. The miners of the base metals, threatened with the two bugbears of business, an overstock and a falling market, are curtailing their output. They know perfectly that the need of metals for reconstruction will be enormous, but just when that demand will manifest itself, they don't know, and until they do the program is to mark time. Before the demand will begin to show in real earnest, order must be re-established in Europe, ocean transport must be resumed, war export and import restrictions must be removed, banking and credit machinery must be re-established, and the traveling salesman must again become a familiar figure in the smoking-rooms of ocean greyhounds and the capitals of the old world. The labor situation in one way is not reassuring, and in another way it is. Labor, carried away with the ease with which it put over the most exorbitant demands during the War, drunk with power, seems to have forgotten that on November 11 last the War ceased. The unions of Seattle, in flagrant disregard of all contracts, agreements, and everything else, temporarily succeeded in shutting-down a great city from one end to the other. A similar attempt in San Francisco has already cost millions of dollars in cancelled ship-contracts, and millions in wages to the workmen. One of the elementary rules of barter and trade lies in the fact that when one desires to sell something that is not actually essential at the time, it is well to be circumspect in one's conduct toward the buyer. The labor of the shipbuilder is no longer so essential as it was a few months ago. The action of the strikers will simply dry up the source of wages; that is all. The exorbitant rates of pay and the deliberate restriction of output are in a fair way to destroy themselves through the overmastering greed of the men. Profiteering in time of War is despicable; in times of peace it simply can't be done. No one wants a low wage-rate; no one wants to lower the scale of living for the American workman. A fair return for the dollar paid is essential, or the world's business will seek other sources of supply. We shall no longer be able to compete; the United States will sink to a second-rate power. The labor unions, however, show unmistakable signs of a return to reason. San Francisco is having strikes, but of comparatively minor importance compared with the great walk-out at Seattle. Attempts of Bolshevist agitators to stampede the unions into reckless action have met with scant success. A steady hand at the wheel is all that is needed for the successful passage of the rapids. All this instability, this uncertainty, which is just as present in the minds of those directing business affairs as in those of the rank and file, is but a stage in the transition from the collapse of the military mobilization of industry to the re-mobilization of peaceful commerce. England is in the throes of labor troubles worse than ours. It is a condition not confined to any geographic boundaries. In time, not so long a time either, these premonitory symptoms will pass. The transition will be gradual, perhaps imperceptible, but nevertheless positive. Within less than a year the product of American mines and factories will again find normal outlets, blocked for nearly two years. Look at the list of 'non-essential' industries, non-essential for war perhaps, but most essential in peace. They are waking from their long sleep and clamoring for recognition. Again we hear of good roads, new buildings, power projects, reclamation, irrigation, municipal improvements, and all sorts of development enterprises that have been quiescent for so many months. Europe's stock of metals has been worse than depleted, South America is waiting for American goods, the Orient beckons to the enterprise of American capital and energy. Buyers, who are holding off hungrily, waiting for the time when they think the falling markets have reached low water, will perforce soon be compelled to come through. Then the starter will work, a snort or two will come from under the hood, the black smoke from the exhaust will become colorless, indicating perfect combustion, the business motor of the United States will be shooting on all six.

The Banker and Mining

One of the most interesting addresses delivered before the recent meeting of the American Mining Congress in San Francisco was that of Mr. Frank B. Anderson, the president of the Bank of California. To those engaged in mining an address on the subject of the banker's relation to mining enterprise was bound to have a piquant interest when coming from the party of the first part, in this instance a financier of the highest reputation, not only in California but farther afield. We give the address on another page of this issue. The function of the banker in a young and growing commonwealth is outlined; it is more closely related to the commercial life of a Western community than is the case in the older communities on the Atlantic coast or on the other side of the same body of turbulent water. The banker is a more important person here than there because he plays a bigger part in the economic life of the region. He is expected to stimulate enterprise and to foster it when started; he plays the benevolent part of the right kind of uncle to a lively school-boy. Mr. Anderson is quick to draw the line at risky escapades; these the good uncle cannot sanction. He delegates the fostering of prospective ventures to syndicates and companies organized for that purpose—to exploration companies. He thinks the Pacific Coast has lacked the help of this type of organization, although he is aware that sundry small groups have done the same kind of work, namely, of selecting prospects and developing them into productive mines. That may be; but California has not entirely escaped the attention of exploration companies established in Boston and New York, in London and Paris. "Venturesome capital" has been available and it is still available, for the United States Smelting, Refining & Mining Company, the New England Exploration Company, the Goldfield Consolidated Mines Company, and Mr. D. C. Jackling—to mention a few—maintain offices in San Francisco for the purpose of investigating promising prospects. A market exists here, and it protects the banker from the importunities of the miner. Not until the enterprise has character, that is, dependability, and not unless the men in control have character, does the banker care to be drawn into the business. That seems proper, for no man—least of all a banker, who is a trustee—should use other people's money in a hazardous venture. Mining should not be done with borrowed money. That is a sound business axiom. We are referring here to working capital, the money that is risked in the effort to ascertain first the value of a mineral deposit and then to bring it to the productive stage. We might go a step further and say that a wise man would use in prospecting only the money that he could afford to lose. At least, no man unversed in mining should do so; let him leave such hazardous, but useful, ventures first to those having the experience required to minimize the risk and preferably to those who have made it their vocation to search for the plums in earth's great pudding. In drawing a distinction between the prospect and the dividend-paying mine Mr. Anderson made a slip; he talked about a "manufacturing proposition". No mining enterprise comes under that category. It is a phrase beloved of persons whom the banker abominates, the reckless promoter. A manufacturer buys raw material and converts it into a finished product; the miner's chief task is to find his own raw material and it is the uncertainty of the finding and the uncertainty as to the quantity of it when found that gives both zest and risk to his work. Mining is always risky; risk is inherent. It is neither a 'gamble', as some say, nor an 'investment', as others assert; at best, it is a sane speculation, in which the risk of great loss is balanced by the chances of exceptional gain. On that we have insisted in these columns many a time. Mr. Anderson quotes the Natomas and Anaconda flotations as examples of the friendly attitude of the banks toward mining. The Natomas was no ordinary mining deal; in that enterprise two phases of business were made complementary, namely, the wasting asset of gold-dredging ground and the accruing asset of land undergoing reclamation. It was expected that the exhaustion of the gold-bearing gravel would keep pace with the winning of cultivable land, but the progress of the two engineering processes did not quite connect, so that further financing became necessary, and it was done, but not without heart-burnings and sacrifices. Likewise the Anaconda Copper Mining Company's issue of bonds for its South American ventures cannot be regarded as a typical transaction, because the Anaconda's proved assets and the proved character of the men behind those assets placed that issue of bonds, for new properties concerning which ample and substantial information was available, on a plane far above that of ordinary mining finance. Mr. Anderson did not refer to a fact, which must have been in the minds of many of the older men listening to him, namely, that the old Bank of California came to grief in 1875 through the speculation of its president, William Ralston, in Comstock shares, notably those of the Ophir mine. We like, however, his insistence upon the basic value of the moral element—of reputation, of the known truthfulness and integrity of a man—as the decisive factor in loaning money, whether for mining or any other purpose. Let us revert to our axiom. Mining is neither an investment nor a gamble; an investment is held for the income that will accrue therefrom, the safety of the principal being deemed sure; a gamble is a game with chance, it bears no relation to business, because it depends upon luck, not sagacity. The test of an investment is to be willing to lock it in a safe for five years; no wise man would do that with mining stock. Speculation is the use of money on the expectation that the principal will enhance in value quickly; to the speculator the dividend is important, not as income or interest on his money, but as an indication of a rise in the market-price of his speculation. The simple-minded buy mining shares for income, the sagacious buy them to sell at a profit; the former are many, the latter are few. Speculation is based on judgment; a gamble is based on hazard. An investment supposes a minimum of risk and a small income return; a speculation involves a large risk, fully compensated by the possibility of a big gain. Risk is implicit in mining; that is why the banker, even if he knew more about it, would properly be wary of participation, as a lender of money; but the risk is no disgrace to mining; on the contrary, it is its chief attraction to those willing to use their money speculatively or adventurously, giving that word its fine old meaning. The sane speculation, after all, may prove not only more profitable than the wild gamble of the reckless and ignorant, but it often proves more profitable than the supposedly safe investment of the timid, for not even the gilt-edged security is immune from loss. A large risk for a large gain makes mining attractive to the adventurous.

DISCUSSION

The Trust Price of Copper

The Editor:

Sir—The above headline is due to the reading, in your issue of February 1, of the illuminating letter from W. W. Wishon. The caption you give his article is: 'The Market Price of Copper'.

Philosophers inform us that knowledge is limited by experience. From the encomiums passed on the Phelps Dodge Corporation by Mr. Wishon, and from his vivid exposition of the 'rank cussedness' of the A. S. & R. Co., I judge his experience has been limited largely to the latter concern. Certainly our own experience with both these corporations has conveyed the knowledge that the difference between them is precisely the same that exists between tweedledum and tweedledee.

Last April, when issuing the annual report of his company, Daniel Guggenheim took the Government of the United States to task for "interfering with the supply-and-demand price of copper," which late in 1917 had been fixed at 23½c. per pound. Irrefragable history, however, teaches us that on March 14, 1916, all copper producers subject to custom smelters—or in other words, the Little Fellows who were subject to the Big Fellows—awoke to the fact that the supply-and-demand price of copper, which had reached about 28c. per pound, would thenceforth be settled for on the basis of 14c. plus ¾c. for each cent additional that the said public market showed. This meant that the Big Fellows had entered into a brazen conspiracy to grab off the cream of the high prices induced by the World War. This "rank deduction" (note the mildness of the language of one of the victims) put a clear profit of 3½c. per pound in the pockets of the custom smelters *before* they began their usual and long-endured exactions, deductions, and hold-outs. The only excuse advanced by these price-fixers was that the high market might drop before they had sold what they had bought. It was a 'sure thing' deal. In *their* business they had discovered a way to eliminate business chances. The buck was successfully passed to the Little Fellows. The coup was so simple and resulted in such a harvest of profit on copper that the Big Fellows put over the same deal, within a few months, on silver and on lead. They 'fixed' the price of silver at 60c. per ounce and the price of lead at 4½c. per pound.

When this grab on copper occurred Mr. Wishon advises us: "Upon calling their attention to the fact that they might readjust their enforced quotations and deductions after they had marketed their copper, they refused to discuss it further." Certainly, there was nothing to discuss. And so, some of us in southern Arizona (who were "unhappily tributary to the Bisbee smelter," as well as to those of the A. S. & R.) determined to invoke the aid of the law. The situation and the records were submitted to the Federal Trade Commission at Washington. This was in September 1917. The hold-up had been going on for a year and a half. In January 1918 the Government sent a corps of examiners to Arizona to investigate. The chief examiner spent nearly two months in Tucson as headquarters. His whereabouts and personality were unknown to the Big Fellows (or supposed to be unknown). In the meantime the Government had stepped in (October 1917) and fixed the price of copper at 23½c. per pound. This action absolutely cut out the excuse given by the Big Fellows in March 1916, but they still withheld their quarter cent deduction, which on a fixed price of 23½c. amounted to almost 2½c. per pound.

While the Government's chief examiner was hard at his labors in Tucson, the Copper Queen smelter suddenly advised all the Little Fellows whose shipping contracts were expiring that they would accept no more of their ores unless they agreed to sign up for either three or five years. The contracts were signed under duress, hence they are voidable.

Upon completion of his work in Tucson the Government's chief examiner remarked: "From all I had seen and heard before reaching Arizona, I had expected to encounter evidence of unfairness and injustice on the part of the custom smelters, but what I have found amazes me. It is the rottenest record I have ever investigated."

Well, what happened? Some of the Little Fellows—those who meet death with their backs facing the wall—concluded to endeavor to lilliputianize our smelter profiteers. In March 1918, I was sent to Washington to confer with the Government's representative, who had finally determined the price of copper at 23½c. per pound. It was soon apparent that this representative knew little or nothing of the small producers' problems and hardships. He was weighted down with smelter 'dope'. Small producers had to journey three thousand miles to present their case. Smelter 'experts' were thick in Washington and New York. After replying to several stereotyped questions and remarks on the copper situation, I turned and asked some pertinent questions of said Government representative. One of the very first replies was: "I'll admit I haven't seen a producer in three months." When crowded on another phase of the matter the response was: "What am I to do when the smelter experts come here and tell me that out in Arizona you have all sorts and varieties of ore that necessitate all sorts and varieties of treatment, which means all sorts and varieties of price schedules?" The reply to that outbreak was: "I'll name you half a dozen mining men in southern Arizona and if you will confront any one of them with your smelter experts he will make 50% of what they have been telling you spell bunk."

On June 1, 1918, with "about the rottenest record ever investigated" in the hands of the Government, the Little Fellows fully anticipated that the contemplated action at Washington on copper would be favorable; that it would result not only in a rise of price but in the elimination of that arbitrary deduction based on 14c. copper. But June 1 came and went without any change whatever. Evidently the lid was diminutive and Barney Baruch was heavy. The lid failed to lift. Late in June the fighters went over Baruch's head and submitted the crucial points to the President. On July 2 (whatever the real reason) the price of copper was unexpectedly announced at 26c. per pound. No reference was made to the arbitrary deduction theretofore by custom smelters—and so the smelters continued to profiteer. Encouraged with the half-victory, the Little Fellows hitched up their pants and took another crack at the Big Fellows. It again resulted in a partial victory. The smelters were permitted to deduct 3½c. per pound instead of their old former basis of 2½c. from the New York price. They died hard and it took months to make them live up to this agreement. They hated to quit on any of their graft.

In March 1918, I had told the authorities at Washington that it would be a futile act, so far as the interests of the Little Fellows were concerned, to raise the price of copper and to shake the custom smelters loose from their 14c. basis steal, unless the other hand of the smelters was also tied. It was pointed out that unless specifically restrained, the custom smelters would equalize the situation again in their favor by raising treatment charges, increasing insoluble deductions, and raising the minimum copper deduction.

Within 48 hours after the Government action on July 2nd last, the custom smelters had issued new *printed* contract-schedules. They raised treatment charges a minimum of one dollar per ton. They raised the minimum deduction of the copper content in ores to 20 pounds from 12. With one stroke these smelters killed the production of any copper carrying less than 5% by the Little Fellows; and if there happened to be any considerable haul to reach a railroad station (as there usually is in the case of said Little Fellows, who cannot construct railroads or smelters) then such arbitrary action likewise killed off 5%, 6%, and even 7% copper ores. But as this would tend to reduce the quantity of copper produced, so much the better for the Big Fellows, who owned all the big copper mines. Not content with those two knockout punches, the smelters soon raised the insoluble deduction from a maximum of 10c. per unit to 18c. per unit. In the refined phrase of modern days: "Can you beat it?"

Yes, the smelters can still beat it. Listen. Mr. Wishon tells us that at the memorable meeting of the Big Fellows in Washington on November 15, 1918, with our old friend Barney presiding, the following decision was recorded: "The present level of prices of the metal and the wage-scale of labor are to be preserved." Just 30 days later the Copper Queen smelter notified the Little Fellows that they would settle for copper at 16c. per pound less that 3½c. deduction—or at 12½c. (and less, of course, treatment charges, insoluble deductions, minimum copper deductions, etc.), and no satisfaction was given as to when the arbitrarily withheld 7c. per pound would be refunded. So once again the Big Fellows are placing *their* business on a sure-thing foundation. Little pickings are not to be sneezed at, and the use of the other fellow's money, when interest rates are high and money all powerful, is worth, it seems, the Big Fellows' while.'

But, I regret to admit, that is not the end or the whole of the Little Fellows' story. You can kick a man for falling, after you have knocked him down, or you can keep beating a dog after it has died—on the theory that the lesson may be learned that there is such a thing as punishment after death. The Copper Queen smelter, in the face of that "decision" of November 15, 1918, "to preserve the present level of prices and the wage-scale of labor," coolly advised its little clients that the aforesaid reduced price settlement would be retroactive to December 1. Can you beat *that*? No. And so the Little Fellows have quit. They are mostly busy re-paying the local banks what they had drawn against car shipments from December 1, on the basis of their *contracts* with the Big Fellows. And what has become of all their laborers? Why their wages were *not* "preserved"—they were ruthlessly slaughtered. They are seeking jobs now from the Big Fellows *at reduced wages*. And so, you see, the Big Fellows killed two birds with a single throw. They reduced the production of copper and they increased the mine-labor supply. To the greed and crafty cunning thus displayed we are compelled to doff hats, but to such an exhibition of humanity and wisdom—well, we shall pause for a right decision. Can this nation go on indefinitely raising, side by side, patriots and profiteers?

But if this story be true—if these statements can be verified—then most assuredly a public outrage has been committed. Why do not Arizona newspapers exploit it? Why not unsheath that deadly weapon, pitiless publicity? Alack and alas! The newspapers of Arizona (those that really know these conditions) are like its United States senators—they lack either guts or freedom, or both. Why does the Copper Queen smelter own or control a string of newspapers in southern Arizona? Why does it own the 'Daily Morning Star' of Tucson? Who would you guess is the original sower of the national seeds that bloom into the scarlet flowers of sansculottism, bolshevism, and I. W. W.-ism? Does American law recognize a distinction between the wicked poor and the wicked rich?

BEN HENEY.

Tucson, Arizona, February 4.

[We publish this letter as expressing the feelings of the small-scale producer toward the smelting companies. Our readers will appreciate further enlightenment on both sides of the question.—EDITOR.]

The Position of Copper Analyzed

The present condition of the copper industry is clearly given in a statement issued by the Federal government on February 4, said Robert C. Gemmell, general manager for the Utah Copper Co., on February 8, according to the Salt Lake 'Tribune'. The official statement follows:

"No market since the armistice was signed. Sales for last 75 days do not amount to 5% of output. Copper stocks on hand at mill, smelter, in transit, and at refineries about 1,000,000,000 lb., representing over $175,000,000 tied-up in stock.

The seriousness of this surplus stock of 1,000,000,000 lb. of copper is the fact that it was all produced on the maximum basis of cost with the expectation of realizing 26c. per pound.

For every cent less than 26c. the producers will lose $10,000,000, so that 18-cent copper means a loss of $80,000,000, which is a very serious factor of demoralization apart from practically no sales for the last 90 days, and little in sight.

Copper production in 1918 averaged 200,000,000 lb. per month, or about 2,500,000,000 lb. for the year, against a pre-war production of 1,500,000,000 pounds.

Normal consumption before the War was about 125,000,000 lb. per month, divided nearly equally between home and export trade.

When peace is proclaimed and the necessary foreign credits are established in this country to finance foreign sales, the normal sales may be recovered and even exceeded, to say 150,000,000 lb. per month.

The problem now before us is how best to safeguard the industry to ensure continued operations and a living wage. Terms of the various sliding-scales automatically regulate wages according to the market price.

Current prices for January 1919 on the terms of the sliding-scale are paid on basis of 30-cent and 32-cent copper, although the December market price for copper was 26 cents, as fixed by the War Industries Board, but no sales.

Wages are therefore 50 to 75 cents higher on the war-basis than they would have been on a peace-basis, according to the sliding-scale.

The absence of any market necessitates reduced production.

Only the most favored operations could continue operations on the 18-cent copper at present cost, and then only if a market can be found for production, as all have reached the limit of their ability in carrying surplus stocks.

It must be realized that the end of the War destroyed the principal consuming market. The building-up of the peace market is being pushed as rapidly as possible, but necessarily requires a little time.

On the signing of the armistice the following conditions existed:

First—the copper producers had very little copper held ahead, as the needs of our Government and of the Allies, which were taking close to 80% of the entire production, were being supplied monthly as required.

Second—at the request of the War Industries Board, the mines continued to run from the middle of November until the end of the year at a fairly high production in order to keep the labor employed awaiting developments.

Third—there now exists an unsold stock of copper in process from the mine to the refinery or in finished form at the refinery of approximately 1,000,000,000 lb. This copper, it must be borne in mind, has been produced on a scale of wages of a 26-cent price, and none of it has been marketed or can be marketed at that price or anywhere near it.

Fourth—a stock of copper is found to be on hand in France, England, and Italy which, while small for war consumption, is a considerable amount in peace times. Amounts of scrap metals are for sale in connection with the cancellation of munitions manufacturing program.

Fifth—foreign governments having purchased their copper at 23 to 26 cents are re-marketing under Government control the stocks bought at those prices, and meanwhile are discouraging and in some cases prohibiting imports of new stocks.

Sixth—in the domestic market manufacturing industry finds itself suddenly cut-off from its business on account of the cancellation of the munitions programs. The renewal of peace industry takes time to bring about and a gap in the business is the result.

Seventh—the combination of the cessation of export trade and the interval required to turn war industries into peace industries has brought about declining prices in copper as well as other commodities, and, while prices are falling, buyers lack courage to purchase."

Commenting upon the evidence, Mr. Gemmell said:

"This is the summing-up of the conditions which have brought about the existing situation, but the present and future interests use even more than the past. It appears that:

First—the using-up of accumulated stocks is progressing, even though it may be slowly, in Europe and in America.

Second—with the coming of peace, northern neutrals and central empires, as well as the rest of the world, will need copper and the manufactured forms in which copper is an important part.

Third—telephone and telegraph companies have a large amount of postponed construction work which must soon be placed.

Fourth—with the coming of spring, considerable construction work may be expected and orders will undoubtedly be placed which require copper.

Fifth—with the better understanding of the very great increase in the cost of production that has occurred in the last five years, confidence will be restored to buyers and they will, accordingly, come into the market, probably at present level of prices.

Sixth giving credits to foreigners for exports will greatly facilitate marketing of copper and other American products. This is now being considered.''

The conference between the copper producers and labor delegates, under the auspices of the Department of Labor, also adopted the following resolution:

''Whereas, the copper industry in peace times has always depended upon export trade for over half its product; and

''Whereas, it appears upon reliable authority that foreign countries have great difficulty at the present time in financing purchases of the products of our country; and

''Whereas, we deem it to the best interest of labor and industry in this country to help remedy this temporary breakdown of the machinery of international trade; therefore, be it

''Resolved, that this meeting of representatives of the labor of the copper industry do urge and recommend that Congress pass such legislation authorizing Government aid as well as furnishing the necessary long-term credits to facilitate the resumption of our export trade in raw materials, agricultural products, and manufactured goods.''

''In the light of the foregoing,'' said Mr. Gemmell, ''it is apparent that we cannot continue to produce and finance the production of copper which we cannot now sell at any price. It was therefore imperative to reduce production, which action necessarily carries with it an increased production cost. In other words, as the production tonnage decreases, the cost per pound of copper increases. It should also be borne in mind that our costs have recently been and are now such, that even if there was a demand for our output at present prices, which there is not, I doubt very much that we would be doing any more than 'swapping' dollars, when the cost of permanent upkeep of the property is considered, and entirely regardless of the fact that these high production costs do not include anything in the way of return of investment for the copper in the ground, which we have paid for in the purchase and improvement of our property.

All these factors considered, it is an indisputable and irrefutable fact that true economy of operation, or what might be termed selfish interest, calls for the closing down of the property until the restoration of normal conditions. This we have no thought of doing, and sincerely hope that such action will not be necessary.

At Bingham we are continuing stripping operations, rather than lay-off men. Stripping means the removal of the overburden or waste rock to expose the ore. This work is always kept several years ahead of ore production, and the true economy of present operations demands its cessation.

At Magna we are operating the mill on a 50% capacity. Inasmuch as all of the ore now being produced could be treated at the Arthur mill, true economy of operations calls for the closing down of the Magna mill. It must be clear that it costs practically as much to operate the Magna mill on a 50% capacity as it does on a full capacity. The cost of treatment is greatly increased by this limited production distributed to the two mills, when one mill could treat the entire tonnage now being produced. Should we close the Magna mill it would mean one of two things, to wit: either no work for the entire working force at Magna, or consolidating the Magna force with the Arthur force and providing half-time work for the consolidated force. This will not be done unless stern necessity compels such action.

It is a matter of keen regret to me that a wage reduction was necessary at this time. I hope I have made it plain that conditions in no way controlled by the management forced such action. In this connection it should be borne in mind that the Utah Copper Co. voluntarily made seven wage increases between August 1, 1914, and July 1, 1918. The fourth increase was made on December 1, 1916, and was based on a selling price of copper at 27½ cents or more per pound. Although the price subsequently fixed by the Government was below 27½ cents per pound, three wage increases were made since December 1, 1916, to wit: July 1, 1917, February 1, 1918, and July 1, 1918, respectively. These three wage increases, amounting to $1 per day for skilled labor and 85 cents per day for unskilled labor, were based, not upon an advance in the price of copper, but in recognition of the increased cost of living expenses, and these three increases still remain in effect. In short, the present wages are based on the sliding-scale, assuming a quotation of 20 cents per pound for copper, and to the wages based upon 20-cent copper there is added the three wage increases aggregating $1 per day for skilled labor and 85 cents per day for unskilled labor in recognition of the increased cost of living. The outstanding fact is that our present wage schedule is today in excess of the schedule which became effective December 1, 1916, based on copper quoted at 27½ cents or more per pound.

The problem before the copper industry today is the preservation of its existence. It is fighting for its very life as an industry. I always have been, and always will be, an optimist as regards the industrial life of our nation; I have no fear of the ultimate results, but in the light of the facts presented, it must be apparent to every sane and reasonable person that until peace terms are definitely known and normal industrial conditions re-established upon a sound foundation, the ad interim period presents grave and perplexing problems. Calm judgment and mutual sacrifices are necessary to tide over this critical period and bring about a restoration of satisfactory and prosperous industrial conditions.

This matter has been the subject of much correspondence between D. C. Jackling, the managing director, and myself, and I may say that, in expressing the views herein stated, I do so with the knowledge and approval of Mr. Jackling.''

Explosives

By ROBERT S. LEWIS

INTRODUCTION. Explosives are divided into two classes: low explosives, such as gunpowder and blasting-powder, characterized by a relatively low rate of detonation and slow pushing effect upon the substances with which they come in contact, and high explosives, such as nitroglycerine, dynamite, and nitrotoluene, characterized by a very rapid rate of detonation and a sharp shattering effect upon the substances they touch.

In general, the energy of explosives is considered to be very great, yet, compared with fuels, explosives are costly and uneconomical sources of energy. Thus the energy furnished by one kilogramme of petroleum in burning to carbon dioxide and water is about 12,000 calories; for coal, about 8000 calories; and for dry wood, from 3500 to 4000 calories. The energy furnished by nitroglycerine is about 1580 calories; by gun-cotton, 1100; and for 75% dynamite, about 1290 calories. The great value of explosives is found in the fact that they liberate all their energy instantly. However, the full force of explosives will not be obtained unless they are properly detonated. Combustion, explosion, and detonation represent three steps of explosive reaction, increasing in violence in the order named. This may apply to high explosives. Dynamite will simply burn if sticks are ignited in the open air. The use of a weak cap or primer may cause dynamite to explode, but only detonation by a primer of suitable strength will bring into action its full explosive force. Nitrotoluene, used as a shell-filler and for demolitions in war, can be detonated only by the use of a very strong cap.

(HERCULES POWDER CO.)

BLACK POWDER is a low explosive. It is also called a progressive, or propelling, explosive. The composition of a good military black powder is 75 parts pulverized potassium nitrate, 15 parts pulverized charcoal, and 10 parts pulverized sulphur. The black charcoal used is made from wood thoroughly charred at about 350 C., and has a composition of 76% C, 4% H, 19% O, and 1% ash.

(HERCULES POWDER CO.)

All the ingredients are separately ground, sifted to ensure the desired fineness, and are then weighed out carefully into 50-lb. lots, in the relative proportions given above. Three lots at one time are run through a mechanical mixing-machine, after which the material goes to another grinding-machine, called the incorporating mill. Here, the ingredients must be most carefully and thoroughly blended to ensure that the powder will be satisfactory. The resultant product, called mill-cake, is placed in open tubs and exposed to the action of the air until the content of moisture is equalized throughout the entire mass. From 2 to 3% moisture should remain in the cake, when it is broken into lumps of approximately uniform size. This material is now pressed into solid and compact cakes. A granulating machine, fitted with toothed cylinders, breaks the press-cake into grains, the size of which is regulated by the length of the teeth and the apertures of the screens placed beneath the machine. The sharp corners of the grains are worn off and the adhering dust is removed in a revolving cylindrical framework covered with coarse canvas, called a dusting machine. If desired, the grains are glazed by revolving them in a barrel-like receptacle in which is placed a small amount of pulverized graphite. Glazing protects the grains to a certain extent from the action of moisture in the air and renders the powder less likely to form dust during storage and transportation. The final step in manufacture is to remove all excess moisture by drying for 16 to 18 hours at 130° F. in shallow canvas-bottomed trays. After drying, the powder is packed in containers holding 100 pounds.

A good black powder should be of even grain, of suitable hardness and density, and free from dust. A small quantity should leave little or no dust when poured upon the back of the hand. Little water should be absorbed from the air, and 10 grains flashed on a copper plate should leave no bead or excessive residue.

Perfect combustion of black powder would give carbon dioxide, nitrogen, and potassium sulphide as products, but in practice combustion is always more or less incomplete. Peele gives the following reaction for the combustion of black powder:

$$20KNO_3 + 30C + 10S = 6K_2CO_3 + K_2SO_4 + 3K_2S_3 + 14CO_2 + 10CO + 10N_2$$

On account of incomplete combustion, carbon monoxide, hydrogen sulphide, nitrate and hyposulphite of potassium may be given off. These products are poisonous when breathed and render it dangerous to carry open lights into the fume.

Military black powders are made only from potassium nitrate, but sodium nitrate, owing to its cheapness, is often used for the manufacture of commercial blasting-powders. It has the disadvantage of readily absorbing moisture, thereby causing rapid deterioration of the powder. Such powders have a composition of 73% sodium nitrate, 16% charcoal, and 11% sulphur. They are made in the following sizes:

Size of grains	Through round holes	On round holes
CCC	40/64 in	32/64 in
CC	36/64	24/64
C	27/64	18/64
F	20/64	12/64
FF	14/64	7/64
FFF	9/64	3/64
FFFF	5/64	2/64

The smaller sizes burn more quickly than the coarser grains, and are used for blasting rock and hard material. The larger sizes are used for blasting coal, shale, and especially for earthwork. Military powder, or gunpowder, is generally smaller in size than blasting-powder except that for large guns balls of powder two inches in diameter may be used. Fuse-powder is a finely granulated (−40 to 100 mesh) black powder having potassium nitrate as the oxidizing agent.

The advantages of black powder are cheapness, non-freezing character, comparative safety for shipping, easy explosion by ignition, and slow action. Its disadvantages are that it requires much tamping, it is easily spoiled by moisture (the nitrate is readily soluble in water), it has a long flame, it yields harmful gases, and it can be easily exploded by blows or friction, especially of iron on iron.

BROWN POWDER is made from under-charred rye-straw. The ingredients are proportioned approximately as follows: potassium nitrate 80 parts, charcoal 16 parts, sulphur 3 parts, and moisture 1 part. This mixture burns more slowly than black powder. Though no longer used as a service powder by the United States, it is interesting to note that the shape of the grains of modern smokeless cannon-powders was evolved from a long series of experiments on brown powder. The fundamental idea involved was to so control the combustion of a charge of powder that there would be a uniformly increasing evolution of gas. As a result, the projectile would be started from rest under a minimum pressure, with the quantity of gas evolved in consecutive instants of time gradually increasing until the projectile reached a certain point in the bore of the gun. The pressure in the gun increases to a maximum soon after the projectile is started, and then falls regularly. The velocity increases to a maximum at a point just beyond the muzzle. Slow combustion was obtained by increasing the density and the size of the grains. The rate of evolution of gas was controlled by perforating the grains. Thus, from the interior outward, the powder burns on an increasing surface, giving for this portion of the grain increasing quantities of gas in successive intervals of time. Uniformity of rate of burning was obtained by molding grains in hexagonal form and producing a higher density on the surface than at the interior. The form of grain most generally used is that of a right hexagonal prism with seven perforations, one opposite each angle and one in the centre. The portion of the grain between the perforations is called the web. Its thickness is the determining factor in the time of combustion.

NITRO-CELLULOSE POWDERS. When substances containing cellulose, such as cotton, flax, and wood fibre, are treated with nitric and sulphuric acids the product is called nitro-cellulose. This is an explosive material that may be considered the base of all forms of smokeless powders. By varying the composition and concentration of the acid mixtures a series of nitro-cellulose can be obtained. Those of highest nitration, having a nitrogen content about 13% or over, are called 'guncottons' and are characterized by their insolubility in a mixture of ether and alcohol. They are soluble in acetone and glacial acetic acid. The nitro-celluloses of lower nitration are called collodion cottons, pyro-collodions, or pyrocelluloses, and are soluble in ether-alcohol solutions. Vielle, as a result of extended research carried out in

1883, concluded that there were eight varieties of nitro-cellulose. He wrote the formula for cellulose $C_{24}H_{40}O_{20}$, quadrupling the common formula $C_6H_{10}O_5$ to account for the amount of NO_2 given by the products of his experiments. He named the different nitro-celluloses as follows:

Cellulose	tetra-nitrate,	$C_{24}H_{36}O_{20}(NO_2)_4$,	having	6.76	nitrogen	
	penta- "	$C_{24}H_{35}O_{20}(NO_2)_5$,		8.02		
	hexa- "	$C_{24}H_{34}O_{20}(NO_2)_6$,		9.15	"	Slightly attacked by ether alcohol
	hepta- "	$C_{24}H_{33}O_{20}(NO_2)_7$,		10.18		Becomes gelatinous in ether alcohol
	octo- "	$C_{24}H_{32}O_{20}(NO_2)_8$,	"	11.11	"	Soluble in ether alcohol
	ennea- "	$C_{24}H_{31}O_{20}(NO_2)_9$,		11.96	"	Highly soluble in ether alcohol
	deca- "	$C_{24}H_{30}O_{20}(NO_2)_{10}$,	"	12.75	"	Highly soluble in ether alcohol
	endeca- "	$C_{24}H_{29}O_{20}(NO_2)_{11}$,	"	13.47	"	Insoluble in ether alcohol

A FACE IN A MASCOT, TENNESSEE, ZINC MINE PREPARED FOR BLASTING (DU PONT CO.)

The French chemist Bruly has made what is undoubtedly the most complete investigation of the nitration of cellulose. He states that the various grades of nitro-cellulose have given rise to many varied uses such as photographic films, celluloid, artificial silk, smokeless powder, and guncotton. As ordinarily made nitro-cellulose is not a single definite chemical compound but is a mixture of guncottons (endeca and deca-nitrates), collodions (ennea, octo, and hepta-nitrates), and friable cottons (penta and tetra-nitrates). One class predominates according to the composition of the nitrating acid-mixture. Since the nitro-celluloses have different properties and are used for various purposes, his experiments had for their object the determination of a method by which any desired degree of nitration could be obtained. He gives the necessary composition of the nitrating mixture to obtain a desired result, and classifies the nitro-celluloses according to their nitrogen content, thus:

Guncottons.	Nitrogen content over 12.9%.
Higher colloids.	Nitrogen content between 12 and 12.9%.
Inferior colloids.	Nitrogen content between 10 and 12%.

Nitro-cellulose has the important property of being soluble in certain liquids in which it was not soluble as cellulose. The most important of these liquids are, as stated above, acetone and a mixture of two parts of ether to one part of alcohol. If an excess of the solvent is used a true solution is formed. Evaporation of the liquid leaves the nitro-cellulose in a horn-like mass called a colloid. No evidence of the cellular structure of the cellulose remains. Acetone dissolves nitro-cellulose of highest nitration, but gives colloids that are brittle and consequently not desirable for gunpowders. The shock of explosion would cause the grains to disintegrate and the rate of combustion would be greatly increased, causing excessive pressures in the gun. The ether-alcohol solution colloids are characterized by their toughness and elasticity. Most smokeless powders are made from this class of colloids, but some satisfactory powders are made from a mixture of the two colloids.

For making military powders short-fibered and clean cotton is generally used. It is stated that the Germans have discovered that wood-pulp gives a higher nitrification and forms a better base for smokeless powder than cotton. The details of making the various grades of smokeless powder vary, but a brief general outline will be given to show the complexity of the process.

Baled cotton is picked apart in a carding machine, boiled in a caustic soda solution to remove grease, and is then bleached in a solution of calcium hypochlorate to remove lignine substances, as these form unstable nitrates. The cotton is then rolled into felt-like sheets, is again picked apart, and is dried at 105° to 110°C. It is now nitrated with the acid mixture in a centrifugal machine. The nitrated cotton does not appear to the eye to have undergone any change, but its weight has increased from 150 to 165%, depending upon the degree of nitration. After boiling in water, the nitro-cellulose is pulped in a machine similar to those used by paper manufacturers. The pulp goes to 'poachers', or large deep tanks, where it is subjected to several boilings (some sodium carbonate being added to the water), stirrings, and washings with cold water. Certain nitro-celluloses receive as many as ten washings with cold water. It is in these poachers that various nitro-celluloses may be mixed or blended to give a product of any desired nitrogen content. After poaching, the material is screened to remove knots, large fibres, sticks, and dirt. It is then dried in a centrifugal wringer. Dehydration is accomplished in a press, in which the nitro-cellulose is first subjected to a pressure of about 3000 lb. per square inch to squeeze out most of the water. Alcohol is then forced in to drive out the remaining water. The cakes are removed from the press, weighed, and immediately placed in tight cans to stop evaporation of the alcohol, enough of which remains in the cake to bring about colloidization when the necessary amount of ether is added in the next step in the process. The resultant colloid is pressed into small cylindrical blocks and then goes to the macaroni press, so called because it gives out its product in long perforated strings. The dies of the press impart the proper size and shape to the strings, which are then cut into suitable lengths to make the grains of powder. This now goes to the solvent-recovery house, where warm air carries off most of the ether and alcohol as vapors. These are condensed on refrigerating-coils. The grains are then 'wet dried' in water at 65°C. This serves to remove the remaining alcohol and ether. After passing through a drying-house the grains are given a coating of trinitrotoluene, which greatly improves the powder. Another wet drying is necessary to remove the solvent used in coating. The final step, before packing and sealing, is to coat the grains with graphite. This protects the grains from sudden shock and also forms a protecting skin to carry off the static electricity caused by friction of the grains against each other.

A pure colloid powder as described above may have other substances added to it for the purpose of obtaining a better ballistic effect. The English cordite originally contained 37% guncotton (acetone colloided), 58% nitro-glycerine, and 5% vaseline. Nitro-glycerine has an excess of oxygen, while guncotton does not contain sufficient oxygen to burn all its carbon to carbon dioxide. The high temperature of the explosion caused rapid erosion of guns, and cordite was replaced by a powder having about 38% nitro-glycerine. The French 'poudre BN' contains 38.67% of guncotton, 33.23% of nitro-cellulose, 18.74% of barium nitrate, 5.54% of potassium nitrate, 3.65% of sodium carbonate, and 1.29% of solvents. The powder for American army and navy guns is a pure nitro-cellulose of not less than 12.6% nitrogen. The well-known E.C. sporting powder contains 26% guncotton, 28% of nitro-cellulose, 4% of cellulose, 38% of potassium nitrate, 2% of camphor, and 2% volatile matter.

GUNCOTTON is a nitro-cellulose of high nitration and contains more than 12.9% nitrogen. The nitro-cellulose is taken from the poacher to the stuff chest, a large vat with an air-tight top. Feathered paddles mounted on a vertical shaft keep the pulp evenly suspended in the liquid. From the stuff chest the pulp is drawn into the molding-press. This makes blocks for the next and final pressing during which operation a maximum pressure of 7000 lb. per square inch is attained. Even then the blocks as they come from the press contain about 15% moisture. Before being placed in storage or put in service they should be soaked in pure water until they contain about 35% moisture. After nitrating, but before pulping, guncotton retains the complete cotton structure, even when viewed under the microscope. The density of the pulp is 0.8 and compressed blocks 1.2.

Nitro-glycerine will not dissolve guncotton, but both guncotton and nitro-glycerine are soluble in acetone, and a combined colloid can be made in this way. Nitro-cellulose soluble in alcohol-ether is partly soluble in nitro-glycerine. The manufacture of blasting gelatine and gelatine dynamites is based upon this property of nitro-cellulose.

Guncotton is used for filling shells, for charging torpedoes, and for various kinds of demolitions. It is pressed into the requisite form in wet state, in which condition it is safe to handle, requiring a powerful primer or a small piece of dry guncotton to effect its detonation. It will keep almost indefinitely when thoroughly purified, and will withstand temperatures as high as 200° F. for a long time, if stored under water or in a damp magazine.

Sodium carbonate in small amount is generally contained in guncotton used for demolitions. It is used to neutralize any free acid that may form in storage and thus prevents decomposition. However, it is not used in finished smokeless powders, as it would cause some smoke and would increase the solid residue in guns.

Cold has no effect on dry guncotton, but wet guncotton when frozen is less compact than dry guncotton owing to the expansion of the mass of the block. Unpulped dry guncotton burns with great rapidity. A small quantity can be burned on top of black powder without igniting it, or in the open hand without injury. Berthelot writes the reaction for guncotton exploded in a closed vessel, as in torpedoes, thus:

$$C_{24}H_{18}O_9(HNO_3)_{11} = 24CO + 24CO_2 + 17H_2 + 12H_2O + 11N_2$$

The value of guncotton as a disrupting agent is due to the fact that it has great force, yet is safe to manufacture, handle, and store. Burning guncotton can be extinguished with water. Wet guncotton cannot be ignited by a flame. A wet disk will dry on the surface and then burn. This process will continue through the whole disk. As much as a ton of guncotton has been safely burned in this way. It has been estimated that the explosion of guncotton in its own volume will give a pressure of 160 tons per square inch. The rate of propagation of explosion in rigid tubes is from 16,000 to 19,000 ft. per second. The violence of the explosion is increased by confinement or tamping. A torpedo does little damage if it explodes against the side of a ship at the water-line.

NITRO-GLYCERINE. The process of making nitro-glycerine is comparatively simple. Well purified glycerine is treated with about 8 parts of nitric acid and 14 parts of sulphuric acid. The time required for nitrating is about one hour. Only a small quantity of nitro-glycerine is made at one time, otherwise it would be impossible to keep the temperature within safe limits because the reaction is very energetic and much heat is produced. Jets of compressed air are used for cooling. The temperature must be held between 60° and 86° F. After nitration, the nitro-glycerine is washed first with cold water, and then with a dilute alkaline solution to remove all remaining traces of acid.

Commercial nitro-glycerine has a yellowish color, but pure nitro-glycerine is a water-white oily liquid and is without odor at ordinary temperatures. It has a slightly sweetish taste and is highly poisonous. A small quantity absorbed through the mouth, nose, or skin will produce symptoms of giddiness and a severe headache. Nitro-glycerine freezes at from 37° to 46° F., and does not melt from the frozen condition until at about 51° F. It is soluble in alcohol of 90% strength and over, ether, chloroform, benzene, methyl and amyl, alcohol, carbolic acid, acetone, and olive oil, but it is insoluble in cold water, 50% alcohol, caustic soda solution, and kerosene. The freezing of nitro-glycerine makes it less sensitive to shock. When frozen it should never be thawed over a naked flame, as such a procedure is likely to cause an explosion. Thawing should be done over steam-pipes at a temperature not above 122° F. or in water-tight vessels at the same temperature. If not pure, nitro-glycerine will decompose spontaneously, changing into a greenish gelatinous substance composed chiefly of oxalic acid, ammonia, and water. A mass of nitro-glycerine will explode if struck by a bullet. Heating it to 356° F. or above will also cause an explosion. The explosive reaction is

$$2C_3H_5O_3(NO_2)_3 = 6CO_2 + 5H_2O + 3N_2 + O$$

It should be noted that no poisonous gases are formed. Nitro-glycerine is about eight times more powerful than gunpowder, weight for weight. When exploded in its own volume it gives a pressure of about 165 tons per square inch. It can be shipped in safety by dissolving it in 15 to 20% wood-alcohol whereupon it loses its explosive properties. The addition of from six to eight times its volume of water to the solution will precipitate the nitro-glycerine. Outside of 'shooting' oil-wells, nitro-glycerine is seldom used in its pure state. It is too dangerous to handle in this form. Its chief use is in the manufacture of dynamites and some smokeless powders. When used in compositions, it has the disadvantage of liquefying at moderately high temperatures and evaporates from explosive substances when they are exposed to a continually varying temperature and a moist atmosphere at the same time. When necessary, nitro-glycerine can be destroyed by chemical action. Any alkaline sulphide solution is satisfactory. An excellent solution is made by dissolving flowers of sulphur in a solution of sodium carbonate.

PICRIC ACID is obtained by the nitration of carbolic acid. Equal quantities of sulphuric and carbolic acids are heated to from 212° to 259° F. in an iron vessel until the mixture becomes readily soluble in cold water. The resultant phenol-sulphuric acid is then treated with nitric acid. After the rather violent action has subsided and the solution has cooled, the picric acid settles out as bright-yellow crystalline flakes. It is purified and dried at 95° F. Picric acid is sparingly soluble in cold water. It dissolves in hot water and benzene and is easily soluble in alcohol. It melts at 252.5° F. without decomposing, and this characteristic is taken advantage of in filling shells and explosive bombs, though picric acid alone is not so much used as are some of its derivatives and mixtures with other substances. The Austrian ecrasite, the English lyddite, the French melinite, the Japanese shimose, the American explosive D, and one form of rackarock are derivatives of picric acid. Experiments have shown that picric acid coming in contact with some metals or their oxides or nitrates, such as lead, iron,

A COYOTE BLAST IN SOUTHERN CALIFORNIA. 95,950 LB. OF TROJAN POWDER BROKE 897,000 TONS OF LIMESTONE

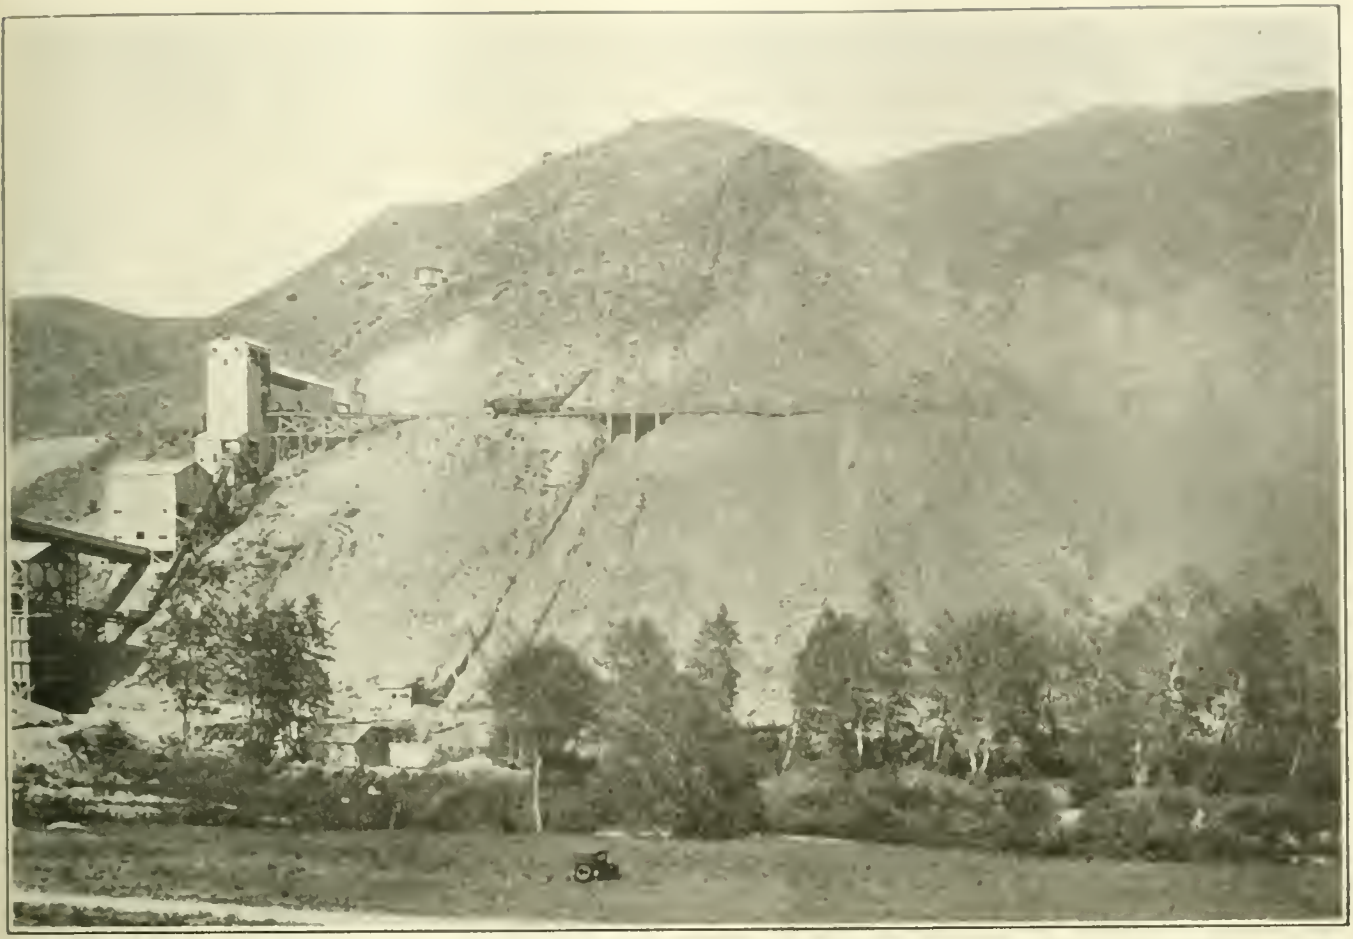
strontium, or potassium, is quite likely to form sensitive explosive salts. Many accidents in handling shells are presumed to be due to red or white lead being used to seal the threads of shell-plugs. The explosive reaction is

$$2C_6H_2(NO_2)_3OH = CO_2 + H_2O + 11CO + 2H_2 + 3N_2$$

Tri-nitro-toluene, tri-nitro-methyl-benzene, or T. N. T., for short, is made by nitrating toluene, a by-product from the manufacture of illuminating gas or obtained by 'cracking' or distilling petroleum. The nitration is done in stages, mono-nitro-toluene and di-nitro-toluene being intermediate products. T. N. T. behaves in a stable manner when exposed to the air under varying conditions of temperature. It is not affected by contact with metals and forms no sensitive compounds with them. Though a powerful explosive when detonated, it cannot be exploded by flame or a blow. A rifle-bullet may be fired through it without effect. Its ignition point is 356° F. Upon being exposed to a flame, the explosive melts, takes fire, and burns with a heavy black smoke. Because of these advantages, T. N. T. is now largely used as a shell-filler and for demolitions, for which use it is cast into blocks, which are then copper-plated to protect the corners. Pure T. N. T. is a slightly yellow fine crystalline powder. It melts at about 177° F. Its explosive force is somewhat less than that of guncotton, nitro-glycerine, or the picrates. Its chemical formula is $C_6H_2CH_3(NO_2)_3$ and the products of its explosion are much like those of picric acid and nitro-celluloses of low nitration.

Blasting gelatine is a yellow or light-brown elastic mixture. It is made by mixing from 5 to 7 parts of soluble nitro-cellulose with from 93 to 95 parts of nitro-glycerine. These two materials are agitated in troughs by means of wooden paddles. When too hard to work with the paddles, the mixture is kneaded by hand until it has a smooth and even consistence. It is then allowed to cool, when the mass becomes a firm compact jelly-like substance soft enough to be easily cut with a knife. It is forced through a circular opening by a screw-conveyor forming a rope or cable that is cut into definite lengths and then wrapped in paraffined paper like ordinary dynamite cartridges. Theoretically it is the most powerful explosive known. From a chemical standpoint more complete combustion takes place with the mixture than with either ingredient. The nitro-glycerine has an excess of oxygen and this supplies the deficiency of oxygen in the nitro-cellulose, causing all the carbon to burn to carbon dioxide instead of to carbon monoxide. Heated slowly to 400° F. blasting gelatine will explode, but small quantities can be burned in the air without exploding.

Blasting gelatine differs from common dynamite in that ordinary pressure does not cause the nitro-glycerine to exude, and it is not affected by the action of water, except at the surface, where it turns white due to the dis-



SAME AS OPPOSITE, AFTER THE DUST HAD SETTLED, SHOWING ROCK BROKEN (TROJAN POWDER CO.)

placement of the nitro-glycerine in the outer layer. At ordinary temperatures it is much less sensitive than common dynamite. However, when frozen it is very sensitive to shock, and, in this respect, is the opposite of common dynamite. If from 1 to 4% of camphor is added to blasting gelatine, it is rendered insensitive to ordinary shock and friction, and requires a very powerful primer for detonation. Owing to its violent action, blasting gelatine is usually mixed with other substances in order to deaden the violence or prolong the duration of the explosive force.

GRANULATED NITRO-GLYCERINE POWDER. The composition of this powder is somewhat similar to that of black blasting powder, but the grains are formed by first melting the ingredients and then forcing the mass through a fine mesh screen. This method of manufacture produces a hard and porous grain. The nitro-glycerine is then added; part of it remains on the surface and part is taken into the pores of the grains. The rate of detonation of this powder is about double that of black blasting powder, and hence it is more suitable for use in rock that is soft and full of seams.

Analysis of a Typical Granulated Nitro-glycerine Powder

	%
Nitro-glycerine	5
Combustible (sulphur, coal, and resin)	35
Sodium nitrate	60

DYNAMITES are a means of utilizing the powerful explosive force of nitro-glycerine and at the same time of avoiding the handling of that substance in its dangerous liquid form by absorbing it in some porous material. The absorbing medium is called a dope. A dope may be inactive as infusiorial earth, or it may be active, as wood pulp, flour, or even black powder, in which case it takes part in the explosion of the dynamite.

Composition of Typical Straight Dynamites

Calcium or magnesium carbonate	1	1	1	1	1	1	1	1	1	1

*Wood pulp, flour, and sulphur for grades below 40%; wood pulp only for others.

The combustible material is the absorbing dope. The principal function of the sodium nitrate is to supply oxygen for burning the combustible. The alkali carbonates are for the purpose of neutralizing any traces of acid that might be present, and which would affect the keeping qualities of the nitro-glycerine. These dynamites are powerful explosives. In fact from a practical standpoint they are the strongest of any of the dynamites. Their action is a quick shattering one, making them suitable for very tough or hard rock. The rate of detonation of 30% dynamite is 14,920 ft. per second and of 64% dynamite 20,490 ft. per second.

AMMONIA DYNAMITES. In this type of dynamite, ammonium nitrate is used to replace part of the nitro-glycerine of the straight dynamites. Upon explosion the ammonium nitrate forms a large amount of water and thus lowers the temperature of the products of explosion. Such a dynamite has a slower rate of detonation and is weaker than straight dynamite. Its great disadvantage is found in the tendency of the ammonium nitrate to absorb moisture from the air. For this reason ammonia dynamites should never be stored in damp or wet places.

Composition of Typical Ammonia Dynamites

	%30	35%	40%	50%	60%
Nitro-glycerine	15	20	22	27	35
Ammonium nitrate	15	15	20	25	30
Sodium nitrate	51	48	42	36	24
Combustible	18	16	15	11	10
Calcium carbonate or zinc oxide	1	1	1	1	1

LOW-FREEZING DYNAMITES. The nitro-glycerine in straight dynamites crystallizes or freezes at a temperature of about 52° F. Once frozen, dynamite should be carefully thawed before using. It has been found that the addition of certain substances, called nitro-substitution compounds, will lower the freezing point to 35° F. or less. These compounds are formed by the action of nitric acid on products derived from coal tar, and all form explosives when mixed with oxidizing agents such as ammonium nitrate, sodium nitrate, or potassium chlorate. Common nitro-substitution compounds are picric acid and derivatives, nitro-toluene, nitro-benzene, and nitro-naphthalene.

Composition of Typical Low-Freezing Dynamites

	30%	35%	40%	45%	50%	55%	60%
Nitro-glycerine	23	26	30	34	38	41	45
Nitro-substitution compounds	7	9	10	11	12	14	15
Combustible	17	16	15	14	14	15	16
Sodium nitrate	52	48	44	40	35	29	23
Calcium or magnesium carbonate	1	1	1	1	1	1	1

Low-freezing dynamites also have a slower rate of detonation than straight dynamites. Their action is more of a simple propulsion or pushing effect, and they are used where the action of straight dynamite would be too violent.

Composition of Low-Freezing Ammonia Dynamites

	30%	35%	40%	50%	60%
Nitro-glycerine	13	17	17	21	27
Nitro-substitution compounds	3	4	4	5	6
Ammonium nitrate	15	15	20	25	30
Sodium nitrate	53	49	45	36	27
Combustible	15	14	13	12	9
Calcium carbonate, or zinc oxide	1	1	1	1	1

GELATINE DYNAMITES. Because of their imperviousness to moisture and the relatively small quantity of poisonous gases produced by their detonation, gelatine dynamites are commonly used in wet or submarine blasting and for blasting in many mines and tunnels. Theoretically gelatine dynamites are the most powerful of dynamites, but practically they are not the equal of straight dynamites in explosive force. This is probably due to the difficulty of securing complete detonation, and also because they are more or less elastic and consequently cannot well be made to completely fill a drill hole.

Composition of Typical Gelatine Dynamites

	30%	35%	40%	50%	55%	60%	70%
Nitro-glycerine	23.0	28.0	33.0	42.0	46.0	50.0	60.0
Nitro-cellulose	0.7	0.9	1.0	1.5	1.7	1.9	2.4
Sodium nitrate	62.3	58.1	52.0	45.5	42.3	38.1	20.0
Combustible*	13.0	12.0	13.0	10.0	9.0	9.0	7.0
Calcium carbonate	1.0	1.0	1.0	1.0	1.0	1.0	1.0

*Wood pulp in 60 and 70% grades; flour, wood pulp, and, in some makes, resin and sulphur in the other grades.

POISONOUS GASES. Practically all dynamites and blasting powders give off poisonous gases upon exploding. The most important of these gases are carbon monoxide and hydrogen sulphide. The following table shows the results of some tests carried out by the U. S. Bureau of Mines:

	Carbon monoxide, %	Hydrogen sulphide, %
Granulated nitro-glycerine powder	2.7	15.7
Black blasting powder	10.8	8.7
Straight dynamite	26.9 to 34.6	not determined
Low-freezing dynamite	47.5	not determined
Ammonia dynamite	3.8	5.4
Gelatine dynamite	3.0	4.1

Fatal accidents due to breathing these fumes have occurred in mines and tunnels. Gelatine dynamite produces the least amount of harmful gases, but even this quantity is dangerous. Workings should be thoroughly ventilated after blasting before men are allowed to return to work. If explosives are not in good condition or are not fully detonated very great quantities of poisonous gases will be evolved.

STRENGTH OF VARIOUS EXPLOSIVES. The following table gives the potential energy and disruptive and propulsive effects of dynamites and blasting powders. These are given in percentages and in all cases 40% straight dynamite is taken as unity or 100%.

	Potential strength	Disruptive effect	Propulsive effect
30% straight dynamite	93.1	84.1	96.8
40% " "	100.0	100.0	100.0
50% " "	111.0	109.2	107.4
60% " "	104.0	119.8	114.9
60% low-freezing dynamite	60.2	93.5	91.2
40% ammonia dynamite	101.8	67.0	99.1
40% gelatine dynamite	105.7	78.4	95.8
5% granulated nitro-glycerine powder	67.6	21.6	53.3
Black blasting powder	71.6	6.8	58.0

Potential energy is determined in the bomb calorimeter and represents the maximum energy that can be produced by the explosive. However, the useful work done by the explosive is a small fraction of this theoretical maximum, consequently a knowledge of the potential energy of an explosive is of little help as a guide in selecting a suitable explosive. The disruptive effect, which is closely related to the shattering force of an explosive, is determined by a rate of detonation apparatus and the expansion of lead blocks from the detonation of internal charges of explosives. The propulsive effect corresponds to the heaving or pushing force of the explosives, and is found by means of pressure gauges and the arc through which a heavy pendulum is swung by the explosion of a definite charge of the explosive. The two latter characteristics are useful guides for comparing the practical value of explosives.

The Du Pont Co. gives the following table for getting the number of cartridges of any given strength required to equal one cartridge of any other strength.

One cartridge, %	60%	50%	45%	40%	35%	30%	25%	20%	15%
60	1.00	1.12	1.20	1.28	1.38	1.50	1.63	1.80	2.08
50	0.89	1.00	1.07	1.14	1.23	1.34	1.45	1.60	1.85
45	0.83	0.93	1.00	1.07	1.15	1.25	1.36	1.50	1.73
40	0.78	0.87	0.94	1.00	1.08	1.17	1.27	1.40	1.59
35	0.72	0.81	0.87	0.93	1.00	1.09	1.18	1.30	1.50
30	0.67	0.75	0.80	0.85	0.92	1.00	1.09	1.20	1.38
25	0.61	0.69	0.74	0.78	0.85	0.92	1.00	1.10	1.27
20	0.55	0.62	0.67	0.71	0.77	0.83	0.90	1.00	1.15
15	0.48	0.54	0.58	0.61	0.66	0.72	0.78	0.86	1.00

Thus 2.08 cartridges of 15% strength would equal 1

cartridge of 60% strength and 1.38 cartridges of 15% would be equivalent to 1 cartridge of 30% strength. The table is, of course, an approximately accurate one, and should be used in connection with some actual tests on the rock to be blasted, in which case it will enable the blaster to select an explosive that will do the work efficiently and satisfactorily.

Unfortunately the trade names of different kinds of dynamites does not truly represent their comparative strengths. A 60% straight dynamite and a 60% low-freezing dynamite will not have the same strength. The potential energy of 40% ammonia dynamite and 40% gelatine dynamite is greater than that of 40% straight dynamite, but the useful work that can be done, represented by the propulsive and disruptive effects, is less. The strength of 60% low-freezing dynamite is not quite equal to that of 40% straight dynamite.

The writer is indebted to the publications listed below for much of the information presented in this article. The subject matter is so arranged that it is impractical to give detailed credit. All the tables but one have been taken from the Bulletins of the U. S. Bureau of Mines.

Dressing Bismuthinite-Molybdenite Ore

At the Kingsgate mine, New South Wales, Australia, a mill to dress 25 tons daily of sorted Bi_2S_3-MoS_2 ore is being erected, to be ready early in April.

The ore occurs as small 'pipes' scattered through a large area of ground, making mining costs rather high. Out of every 100 tons of material mined, sorting reduces this to 40 tons for the concentrating plant.

The power-plant consists of two 100-hp. multitubular boilers, 160-hp. cross-compound engine driving the mill and 14 by 12-in. Ingersoll-Rand compressor, 4 jack-hammers, 1 stope-hammer, Little Tugger hoist for hauling ore from the various deposits, and pumps.

The mill flow-sheet is as follows:

The ore passes over a timber-bridge roadway to an elevated ore-paddock, thence through a No. 1 Dodge breaker into a 50-ton ore-bin. A Challenge ore-feeder (water is added at this point) feeds a pair of 25 by 14-in. rolls. An 8-in. balata belt bucket-elevator delivers to 14 by 14-in. rolls, followed by a shaking-screen, 14 by 14-in. rolls, another 8-in. elevator, May brothers' 2-hutch jig, 2 sets of 14 by 14-in. rolls, and 3 Wilfley tables. This comprises the coarse concentrating portion of the plant. The pulp then flows on to two 5-ft. Forwood-Down grinding-pans, being reduced to 30 or 40-mesh, then over 1 Wiltley table and 2 Frue vanners. This completes the bismuth recovery. Spitzkasten are used throughout for classification. The molybdenite is recovered by the latest type Minerals Separation 8-cell sub-aeration machine. The first concentrate is raised to 80% MoS_2 or over, by means of a single-cell sub-aerator.

Manganese Ore in Uruguay

*Manganese is found in practically all parts of Uruguay. Numerous small and some larger deposits have been examined by, or are known to, the Bureau of Geology, and are mentioned in a report on the mineral resources of the country published in 1916. Most of the deposits are too small or too poor in quality to make exploitation worth while. In other cases, lack of transportation and timber stand in the way of successful operation.

One of the principal deposits is found in the Department of Rivera, near the Arroyo Zapucay. Here there are two hills almost entirely of ore, and it is estimated that 80,000,000 tons could be extracted by open-cuts. The deposit is covered by nine concessions extending over 22,000 acres, and is the property of the Uruguay Manganese Co. Analysis shows an average content of 34.8% iron, 22.7% manganese, 9% silica, 0.03% phosphorus, and 0.05% sulphur. The Uruguay Manganese Co. was formed at Montevideo several years ago, the capital being subscribed largely in Great Britain. It was planned to build a 75-mile branch of the Central Uruguay railroad to the deposit, and the venture aroused much interest. Little development has been done, however, and the deposit is not being worked. There are at present no transportation facilities, and the necessary fuel and timber for such a manganiferous-iron property are lacking. The same difficulties stand in the way of working a similar deposit at Caraguatá, in the Department of Tucuarembó.

There are a number of smaller deposits of manganese in other departments. One of these is at Carrasco, 9 miles east of Montevideo on the coast. It has been examined by representatives of British and German interests, and is being worked at present on a small scale, the ore being used by glass factories. The outcrops are small and scattered, and the deposit appears to extend north and south from 500 to 650 ft., with a width of 165 ft. The ore is stated to contain from 30 to 40% manganese.

As far as is known, the only manganese in Uruguay being worked on any scale at present is a 16-ft. vein composed of small stringers at the Pantanoso, in the immediate vicinity of Montevideo. The owners, who are Argentines, claim to have invested $100,000. Ore is being extracted at a depth of 90 ft. Most of the ore is hand-picked.

The Banker and Mining

By FRANK B. ANDERSON

[*]Your chairman has given me two suggestions—one the duty of the banks, and the other the duty of the clients of the banks. The banks in a locality are charged with the duty of seeing that the resources of that locality are financed in some way. Whether or not it is possible for the banks to directly engage in that financing is another question. We are living in a comparatively young country—in a comparatively young section of that country. We are living under a democracy, and sometimes I think of the story that was once told me of the discussions of, I think, the Constitutional Convention, when there seemed to be so much doubt as to the nature of the different classes of government. One of the delegates from New England got up and made a speech on the subject of what constituted a monarchy, and what constituted a limited monarchy, and finally what constituted a democracy. He said that a monarchy was like a great ship that plowed across a smooth ocean, lights burning, bands playing and the passengers all happy, and struck a rock and went down; that a democracy was like a raft: you could not sink it, but your feet were in the water all the time. That applies as well to the banking business of the United States in the past. We have in this country about 28,000 banks. Unfortunately we are a few shy of 28,000 bankers. The prime duty of the men sitting at the head of those banks is to keep their institutions in such shape that they can respond to the demands of the people whose money they are loaning. Their prime duty is to keep their investment in such liquid form that they will be able to respond to the demands of the community, the demands of their depositors, and so that they will not bring about a failure on their part which will be reflected in every walk of life in that particular community.

The banks of a city like San Francisco have a peculiar duty, as the reserves of all the country banks are entrusted to the city banks, and their duty to keep their funds in liquid shape is a much sterner duty than the duty of the country banker, who has no such obligation to perform. I was brought up in that wicked street called Wall Street. I came to California in 1903. In looking over the banking situation it was perfectly clear to me that the banks were called upon to do a great deal of financing which was not proper financing for commercial banks to do. At the same time they had to do it in order to perform the duty that your chairman speaks of, and that is to bring to a high point of development the resources of this territory. The Coast lacked a number of different pieces of financial machinery: the bond-broker, the note-broker, for instance. We induced those men to come out to the Coast. We told them of the opportunity there was on this Coast. They came; and I remember with some amusement that some of the bankers rather resented this foreign money being brought into this territory for the purpose of competing with their money. The answer seemed to me to be perfectly obvious, that if their money came into these fields, and plowed any of these fields, I get my share of the worms. You gentlemen know that these different agencies have brought into the community many hundreds of millions of dollars, and you know that these dollars, working, seeking the reward that they were after, have aided in building up a great many of the industries of the Coast. This Coast has never had anything in the nature of an exploration company. It has always needed something in the nature of an exploration company, a company formed by men whose character was high, whose capital was large, whose capital was subscribed for the purpose of taking risks, subscribed for the purpose of investigating prospects, bringing them into being, and bringing them to a point where the banks were justified in making loans, and bringing them to a point where they were justified in offering the securities to the public. There have been small groups on this Coast who have taken those risks as individuals. There have been large groups that have come from the older parts of the country—New England, for instance. There have been large groups that have come from England and from France; but the mining industry, beginning at the point of development, is one that has got to be carried on by venturesome capital. It finally passes that stage, and it gets to a point where it is nothing but a manufacturing proposition, a question of whether or not intelligence is used in directing the enterprise, and whether the costs are kept down, and whether there is character sufficient to keep enough of the reserve back of you so that you can continue to conduct your enterprise when your ore is pinching out. The attitude of the bank that I happen to represent toward the mining industry is practically the same that it is toward any other industry. If there is character back of the management, if the men have the reputation of being experts, if they have the reputation of being honest—in other words, if they have character—the bank that I represent has aided those men, and the other banks in the city of San Francisco have aided many of them. I can think of instances where the banks, traveling along the line of least resistance, when mining enterprises have gotten into difficulties, would have exercised a banker's lien, taken the deposit that happened to be there, to cancel the loan and say, "We are sorry. Go ahead and work yourself out." I have known of several instances where the banks have refrained from doing that, and have put their shoulders to the wheel, and have carried the undertaking to a sound reorganization. Most people think that the banks lend against collateral entirely. That is a false idea. The commercial banks, very few of them, lend against collateral. The banks loan against the statement of men in whom they have gained confidence and whom they trust.

---

[*] An address delivered before the California chapter of the American Mining Congress at San Francisco on January 16.

So far as the duty of the client goes, I do not know that I can blame all bankers, Mr. Chairman, for measuring every line of effort with the same yard-stick There are few business men who realize the value of one asset that they have got. Their are very few of them that will take the trouble to educate their banker in their particular line of business, and by educating him unconsciously make him become interested in their problems. A number of people resent even the questions that their bankers ask. I don't know exactly why; but there is no more valuable asset that any business man has, I will say over again, than that of forcing his banker to know his business and to unconsciously become interested in his problems. So much for the duty of the client.

The banks of the country have recently given evidence of their attitude toward mining in the large flotation of the bonds by the Anaconda. The banks of this community have given evidence of their attitude toward mining investments in connection with such companies as the Natomas Company and the General Petroleum Corporation. The type of mine that my friend over here represents, if it ever needed money, would have no difficulty in getting it; and the type of mine that all of you gentlemen represent, if you run along the same lines. You never had any difficulty in getting money from your bankers, and you never will; but the banker cannot loan its funds to exploit or develop a mining enterprise, whether it be gold or oil or what it may be; but the individual who wants to exploit that particular prospect, if those individuals are known to have the expert knowledge, if they have formed a habit of telling the truth and keeping their word, they can be helped, and they have been helped in the past; and there are men in this room who can testify to the fact.

The problem that confronts us in the future is a difficult one. I have no solution for it. It is extremely interesting to me to sit down and listen to the guesses of the men who have solutions for them. They are no better than guesses. Some of them are fascinating guesses. The situation in which we stand today is one where we have got to pick up each day as it comes and solve the problems of that day, and to keep our heads, keep our courage, and exercise our usual common-sense. We have successfully solved the problems of the past; we may have made a good deal of noise about it and made a lot of waste, but we have solved them, and I think we will solve the problems of the future in the same way. I hope and pray that men who have the influence that you gentlemen have will make it known in no uncertain terms that this country was made through personal initiative, and we want to get back to personal initiative as quickly as we can. The demands on the Government for all sorts of expenditures and commissions for reconstruction problems are insistent; some of them sound logical; some of them should be undertaken; but the Government has got to be made to understand that it has got to live inside of its income, and live inside of an income that the business man can contribute without paralyzing his business. You gentlemen are interested in the thing that interests the whole people, and that is to see the dollar get back to its purchasing power. The expenditures of the Government during the War have exceeded the amount that can be raised by taxation or by loans from the actual savings of the people. The expenditures have been upon a scale that has never yet been attempted; necessarily so; and because the object that we were trying to attain was so high up—hung up so high that everybody could see it and understand it—the population got back of it, and had no patience with the theorist or the politician or anyone who objected or tried to work against it. The people could see the object and they went for it. But we were forced into a position where we had to spend money in a year and a half a lot of which we ought to have been spending over the last twenty or twenty-five or forty years. The father of every generation in this country since the foundation of the country has either had to put the uniform on his back or he has had to sit by and look at a war. There is no doubt there are men in this room who can go back to their family record and find that the father of every generation has had to put the uniform on his back. There are men sitting in this room that have seen this country in three wars, and yet there has been no sentiment whatever to make any preparation, or to give any of the young men growing up any teaching that would aid them to carry out the duties that were going to be thrust upon them as it was thrust upon their fathers. Necessarily we had to spend a great deal more money than would have been necessary if we had thought ahead a little.

Now that is not only true in regard to the question of preparedness. It is true in regard to practically everything that we have to undertake. We have been busy during all these generations settling and developing a great big, vast, rich territory. The rewards for that development right under our nose were more attractive than the rewards from the outside. We were too busy to care very much about the character of people that were elected to office, many of them earnest men, but men whose knowledge was confined to the needs of their own localities; and practically all the laws that we have on the statute-books are laws which were put there by brains and minds that understood local problems only. We have reached a point where, in order to keep our great manufacturing institutions going, to keep up the purchasing power of the people that have been built up around those great manufacturing institutions, we have got to seek the trade of the world, and we have got to go out and compete with peoples who have spent hundreds of years and thousands of lives and millions of dollars in entrenching themselves in strategical points (from the commercial standpoint) and we have to compete with them with laws that practically make it impossible for us to compete. We have got to get that thing hung up so that the population can see and understand it, and then sweep aside the theorist and demand laws that will allow us to compete successfully.

To go back a minute, I said that the Government had exceeded the amount that could be raised by taxation or by loans from the actual savings of the people, necessitating the creation of credits with the banks direct, and through the people with the banks, to enable them to carry out their duty in purchasing these new credits, with the result that the purchasing power created has exceeded the purchasable goods and services, resulting in competition for those goods and services between the Government and its own people, and consequently driving up prices, which has created a hardship for the people of the country, and particularly for the gold-mining industry, whose product is at a fixed price. A sound permanent cure can come only through an absorption of that credit which has been created, by actual savings, by a cessation of borrowing on the part of the Government as soon as it is practicable, and by an understanding on the part of the Government that it must reduce its activities to a point where it can live within its income, and within an income, as I said before, that can be collected without paralyzing every line of effort. The situation can only be cured, as I said, through genuine savings. Continued borrowing beyond the power of the people to absorb will only retard the return to normal prices and aggravate the situation that exists at present. Abnormal taxation, such taxation as we have today, will kill initiative and paralyze business. I know of institutions which, if they could liquidate today, would be in a much better position than if they continue to do the business because of the fact that the day is coming that they will have to liquidate their high-priced assets at declining prices. The quick solution of the problem, again, I say, is economy on the part of the nation and the people; and to the extent that this is observed the purchasing power of the dollar will be restored. To the extent that it is ignored the purchasing power of the dollar will decline. Mere creation of money and credits will not solve the problem. The bills of the past have got to be paid by goods and services, and the nation that works the hardest, that produces the most, and that consumes the least, will be the nation that gets out of its problems the quickest.

The December bulletin of the National Bank of New York, in the course of some interesting remarks anent the great accumulation of gold in the United States, contains the following: There are people who will listen with amazement to the suggestion that we ought to get rid of some of our gold. It seems altogether inconsistent with our embargo, still in effect, under which we forbid the exportation of gold even to pay our legitimate debts. But it was pointed out two years ago when the heavy importations were made that they involved an after-the-war problem. The perils of having more than our rightful share of the world's gold were pointed out at that time. They exist in the fact that in the long run there is a relationship between the gold reserves, the state of credit, and the level of prices. Gold does not lie indefinitely idle. While it is idle it is harmless, but when it is used in excess it works mischief. Nothing but a condition of industrial activity and level of prices approximating that which we have been experiencing during the War can keep this stock of gold employed, and at this level of prices it is very doubtful whether we can sell anything abroad after Europe has resumed production at the normal rate. In other words, this stock of gold seems likely to be either idle on our hands, in which case it is dead capital, or, if in use as the basis of credit, the means of elevating us to a trade position so far above the rest of the world outside that it will be untenable.

Analysis of Graphite Ore

[*]The method of analyzing graphite products or ores has never been standardized to the extent of defining volatile and fixed carbon in a manner acceptable to all analysts. Accurate methods used in determining carbon in graphite products are tedious. Work recently done by the Pittsburgh Experiment Station of the U. S. Bureau of Mines on the chemical analysis of graphite products had in view the devising of a rapid, accurate, and simple method of analysis with a fair degree of accuracy.

A sample, weighing 0.2 to 1 gramme, depending upon the relative amount of graphitic carbon, is placed in a 100-cc. evaporating dish with 25 cc. of 1 to 1 HCl, heated over a hot plate for 15 minutes, filtered through a filter of ignited asbestos, and washed with hot water until free from chlorides. The filter and the residue are then transferred to a porcelain or platinum boat, and dried on the hot plate. The boat containing the residue is transferred to the tube of a combustion furnace and burned in a stream of oxygen gas, the CO_2 formed being collected in a potash bulb with a 30% KOH solution, and the amount of CO_2 weighed. The combustion tube should contain some fused lead chromate to retain any sulphur that may be present.

Concentrates are likely to contain flotation oils, which must, of course, be removed before combustion, or too high results will be obtained for graphitic carbon. This may be done by placing a sample weighing 0.2 to 0.5 gramme in a small Erlenmeyer flask, adding 25 cc. of ether, corking loosely, and allowing to stand for about a half hour, shaking at intervals. This mixture is filtered onto asbestos in a Gooch crucible, the asbestos having previously been washed with hydrochloric acid and ignited. The residue on the filter is then washed with alcohol and finally with distilled water; it is then ready to be treated with acid for the removal of possible carbonates, as is done in the treatment of ores.

---

[*] Abstract from U. S. Bureau of Mines publication 'Preparation of Crucible Graphite', by G. C. Dub.

Possibilities of Dredging in the Oroville District, California

By CHARLES H. THURMAN

The possibility of re-dredging profitably the Oroville field has been the subject of much interest to gold miners, especially those who were active in the district during its early days.

There were three reasons why the earlier type of dredge did not recover all of the gold:

1. Inability to dig all of the gold-bearing gravel from any given area.
2. Inadequate gold-saving appliances.
3. Limited storage for tailing at the rear of the dredge on account of short sluices and stackers.

On account of the light weight of the digging-ladder on the older dredges they could not dig efficiently at a greater depth than 22 ft. below water-level. In many cases the constant danger of running the bucket-line off the lower tumbler prevented digging to a greater depth. Where the dredge was set stationary and the buckets were lowered straight down, the gravel was excavated to a depth of 30 ft. Then the buckets would be raised and the dredge moved sideways the width of the bucket-line, becoming chored in a stationary position once more while the operation of 'chopping down' was continued.

In stiff ground this did not work well, because the hubs of the lower tumbler would ride on the side of the gravel-bank. This had a tendency to cause the digging-ladder to slip sideways into the cut out of which it had just been moved. In such cases it became necessary to move sideways more than the width of the bucket-line, which resulted in leaving ridges or peaks of un-dredged ground between 'settings'. These ridges had a height of from 1 to 10 ft., with a corresponding width at the base. This condition was noticeable in 106 acres that were re-dredged from September 1916 to date. The same results were produced with both the dipper type of dredge and the continuous bucket-line type, the latter of which then dug on a head-line instead of a spud.

Many of the head-line dredges endeavored to clean-up the bottom by the side-swinging method, as now practised on newer dredges, but, on account of the light digging-ladders in use at that time, and the limited distance that the dredge could swing on account of the head-line, it was impossible to clean-up the bedrock thoroughly.

All the gold-bearing material brought up by the bucket-lines did not reach the gold-saving devices, as the flat-shaped buckets of the open-link type spilled much of the gravel back into the pond in the first 30 ft. of travel up the ladder.

Another great waste occurred when the buckets began to turn on the upper tumbler. The shape of the buckets allowed the gravel to spill too soon, and the receiving end of the hopper was set so far aft that considerable material fell back into the pond. This spill in the well-hole was excessive at times, filling up the pond until the hull of the dredge became grounded. Usually only sufficient overburden was removed to float the dredge, in some cases not over 10 ft. in depth. These abandoned strips of ground varied in size from 20 to 30 ft. wide to the full length of the hull, which was approximately 100 feet.

Much ground was left undredged on account of short tail-sluices, which dumped the fine so close to the hull that the dredges were crowded ahead before the bedrock was cleaned-up. Short stacking-conveyors for heavy gravel were another cause of abandoned ground. These conveyors fouled against the high tailing-piles in the rear and necessitated the moving of the dredge ahead before all of the ground was cleaned-up. On the modern dredges there is a drip-pan that extends the full length of the digging-ladder. This carries the spilled material back to the face of the cut, where the buckets can pick it up again. At the receiving-hopper the bucket-idler below the upper tumbler holds the slack of the bucket-line in order that the receiving-hopper can be built out far enough under the buckets to catch material with as little spill as possible. Furthermore, the newer dredges have a much more elaborate 'save-all' than the earlier ones; also, spray nozzles to wash out gold-bearing material that might stick to the inside or outside of the buckets after they have dumped. It may be well at this point to state that enough gold is caught in the 'save-all' alone to pay for the power required to operate the modern dredge. This furnishes an idea of the gold lost at this point alone on the earlier dredges.

On the old dredges the screens for separating sand and gold from the gravel were adequate, but the gold-saving riffles were inefficient on two different counts:

1. The system for the distribution of water and fine allowed 75% of the fine to flow out of the first two riffle-sluices on the tables, while it should have been distributed equally between 16 riffle-sluices. In many cases, this caused the fine sediment to collect to a depth of three inches and the fine gold had little chance to settle on the quicksilver in the riffles.

2. The fine passed over only from 30 to 50 ft. of gold-saving riffles, whereas, by actual test made on the Oroville property of the Natomas company, in 1915, it was proved that the fine should pass over not less than 90 ft. of gold-saving riffles in order to save the major portion of the fine gold.

This last point was demonstrated by me several years ago with a 6-ft. Bucyrus dredge that had a very efficient digging apparatus but a length of riffle insufficient to treat the fine sediment. After this dredge had been operated ten years at a profit, riffles were put in a drop-extension tail-sluice and an average of $125 per month was saved during the remaining life of the dredging operation.

Another waste of ground was caused in some instances by crowding the dredge-masters and winch-men for heavy yardages. This had a tendency to cause careless winch-men to move ahead without thoroughly cleaning up the bedrock, often leaving several feet of the best gravel on the bottom. Areas dredged in this manner may be detected easily today by the unevenness of the tailing-piles, showing that the maximum depth was reached in some places only every 25 ft., as the dredge advanced.

The main reason why it appears possible to re-dredge successfully in certain portions of the Oroville district is the fact that 106 acres have been re-dredged since September 1916 by the Natomas company. In this work there were used two 7½-ft. dredges and a satisfactory profit was made. There can be little doubt that there remains a large area of the same character of tailing.

In the re-dredging operations of the Natomas company, ground has been found untouched and in the condition indicated in previous paragraphs. The net profit from re-dredging is much less than was won at the first dredging, but it has been proved that the tailing can be re-dredged at a cost 33⅓% less than the work in virgin ground, and that 99% of the remaining gold can be saved with riffle-sluices that are ample in length.

It should not be difficult to determine what part of the Oroville area would yield a profit from re-dredging, for the first ground dredged was close to the mouth of the cañyon and this was the richest in gold and principally worked by the type of dredge that could not recover all of the gravel nor save all of the gold. The decision of the proper type of dredge to re-dredge this ground is easily made. It should be the Hopfield type, which leaves the ground level and would make it possible to derive some revenue from the reclaimed land.

SHORTAGE of potash during the War demonstrated the fact that extremely injurious effects are produced by the want of a suitable quantity of this material available in the soil for plant food. Despite the efforts that have been made to produce potash in this country, which will probably result in the continuance of the industry under some proper form of protection, the possibilities of releasing more potash from the mineral constituents of the soil by proper treatment has also assumed a new importance. This subject was recently discussed by D. K. Tressler in 'Soil Science'. He found that calcium sulphate in solution increases the solubility of K_2O in some soils. It is more marked in clay than in silt or sand. Certain silt-loam soils showed a higher degree of solubility for potash in the presence of large amounts of CO_2 and $CaCO_3$. Sodium salts are very active in dissolving K_2O from the soil minerals.

The Crushing of Steel Caps

By A. C. STODDARD

At the Inspiration Consolidated Copper Co. there was a main haulage-drift into one side of which there holed a branch haulage-drift; also, from this main haulage-drift there was another branch haulage-drift that was on the same line as the one first-mentioned. This arrangement threw one pair of raises into the main haulage-drift and made a train go to this one pair instead of drawing from them in succession; therefore, it was decided to drive through from the drift that holed into the main haulage to another branch haulage. When this was done it was found that there was no pillar left, this was due to a number of causes, which, in detail, were:

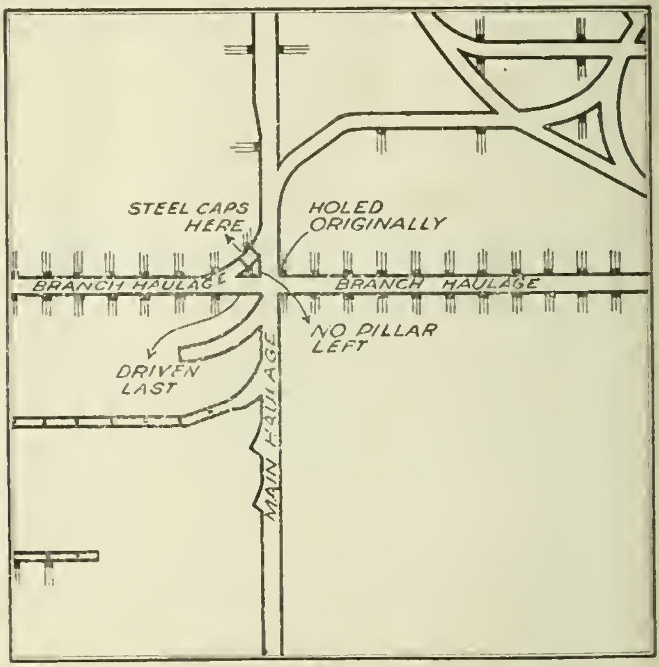

DIAGRAM SHOWING AREA OF HEAVY PRESSURES

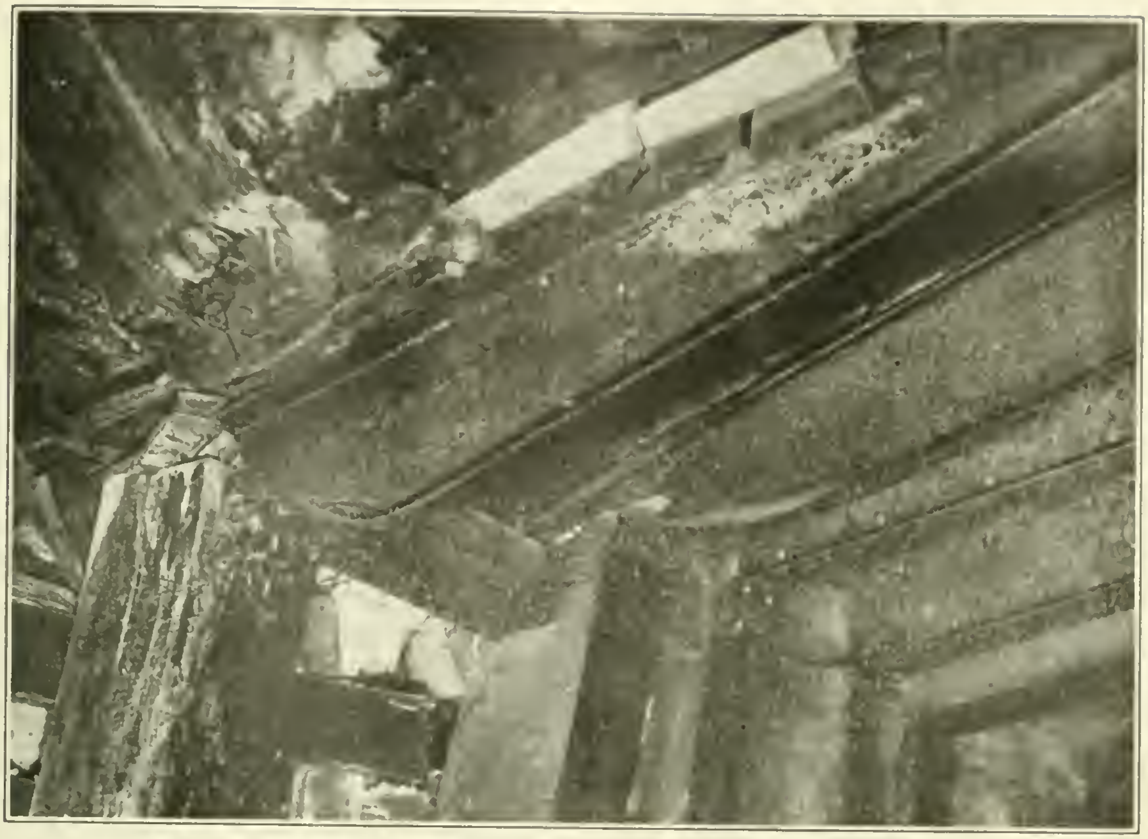
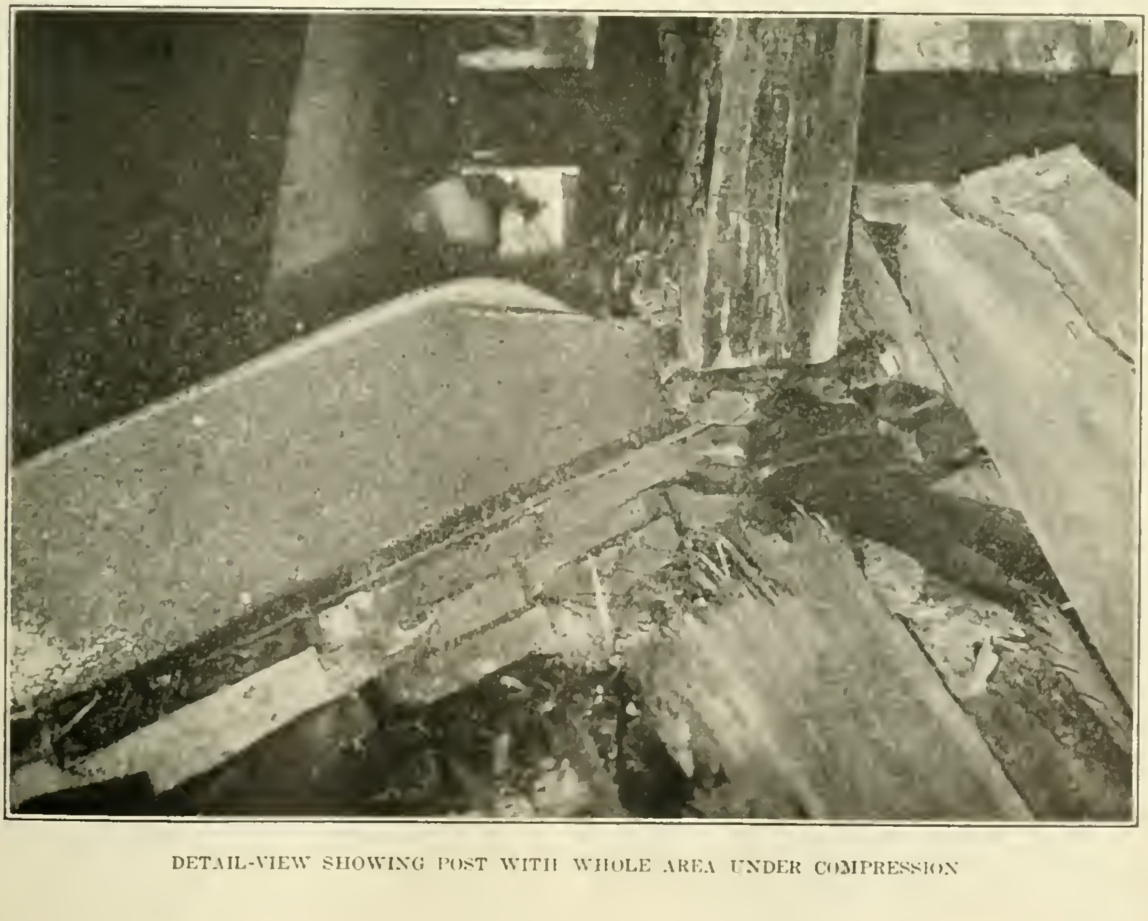
The size of the drifts left a very small area standing; almost immediately over this area a cross-cut had been driven on the first level above, and on the second level above there had been a pillar left in stoping, which allowed the weight to be transferred to the haulage and branch-haulage levels. This weight was almost straight down and it was found that it could not be held by wooden caps. It was decided, therefore, to use steel caps, and wooden 12 by 12-in. posts. The posts were framed flat on the top and a steel bearing-plate was put on the surface. The caps were made of 12-in. I-beams that had a riveted shoulder of 2½ by 2½-in. angles on them. These caps were put in place on the bearing-plates, and, although they deformed, they took and held the weight. The posts, owing to the bearing-plates, had their whole area in compression and did not fail, although the plates pushed down into them. The sets were put in about June 1916, took the weight immediately, and have stood ever since.



WOODEN POSTS WITH STEEL CAPS REPLACING ORE-PILLARS

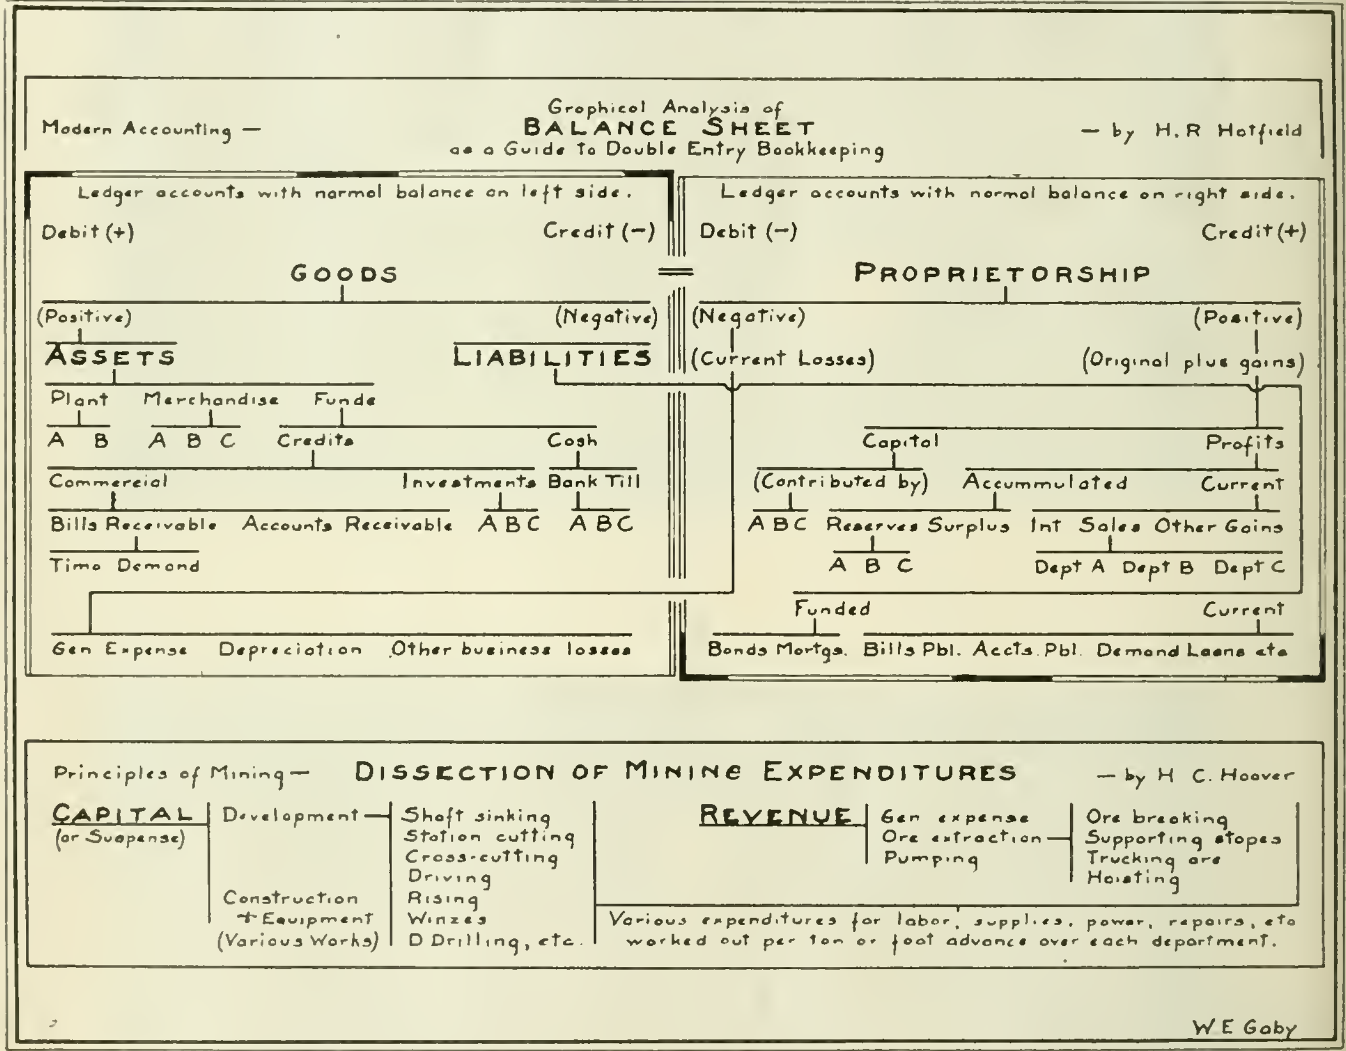


DETAIL-VIEW SHOWING POST WITH WHOLE AREA UNDER COMPRESSION

Graphical Analysis of Accounting

By WALTER E. GABY

While recently reviewing texts on accounting, I hit upon a scheme of representing somewhat in the form of a flow-sheet the elements of double-entry book-keeping. Engineering and mining geology hardly fit one to offer an instructive article on such a subject, but as the chart here given may help others to a firmer grasp of some of the principles of accounting, it is presented with this hope.



Industrial accounting is based on the indicated system, in which there is a constant balancing of the equation:

Goods = Proprietorship

By following the lines of the diagram it will also be seen that there are positive and negative goods (assets and liabilities), and positive and negative proprietorship (represented by items showing worth). The algebraic sum of goods is equal to proprietorship or net worth, and is the equation shown by the balance-sheet, transpositions of the negative accounts being made as indicated in order to avoid subtractions. For the purpose of securing a balance, it is obvious that a negative proprietorship account is equivalent to a positive goods account, and hence is listed on the same side of the balance-sheet.

The sub-titles in the diagram are the names of the various customary accounts or classes thereof. When all ledger entries are properly made these accounts normally divide themselves according to the above principles, one division with balances on the left (debit) side and the other with balances on the right (credit) side. The confusion often experienced by the novice in using the terms 'debit' and 'credit' may be avoided if it is remembered that they are merely the names of sides of an equation, which for every transaction is satisfied by an even number (four) of equivalent balanced entries in the ledger. With a clear conception of how every item should enter into the balance-sheet, and why, there should be little difficulty in handling accounts in the ledger. This is the logic—the secret—of double-entry book-keeping.

Questions sometimes arise as to the classification of expenditures, and for the convenience of those desiring something definite on these points in the mining industry there has been added such an authoritative dissection of mining costs.

SLIME from the Balaghat, Champion Reef, Mysore, Nundydroog, and Ooregum mills on the Kolar goldfield, India, is now utilized in the manufacture of brick of excellent quality. A plant was erected by the principal companies, the product being used at the mines.

REVIEW OF MINING

BUTTE, MONTANA

Strike Notes.—A. I. M. E. Meeting.—Boston & Montana Development Company.

The strike at Butte has reached serious proportions; operations at the mines are at a standstill therefrom. The striking miners are picketing all roads and trails leading to the mines, and were successful in stopping the street-car service entirely throughout the city, thus making it practically impossible for loyal men to go to work. None of the other unions have voted on the strike, but many of their members are out in sympathy with the miners. In handbills, which the I. W. W. strikers are circulating, they demand a six-hour day—from collar to collar—with $6 as minimum pay; but so far they have not made any formal demands on the companies. Major A. M. Jones is here with part of the 44th U. S. Infantry, and while martial law has not been declared, the soldiers are assisting local authorities in preventing lawlessness. [Further notes on the strike will be found in The Mining Summary.]

The sixth annual meeting of the Montana Section of the A. I. M. E. was held at the Silver Bow club on February 7. The following officers were elected for the ensuing year: Frederick Laist, president; F. W. Bacon, vice-chairman; E. B. Young (re-elected), secretary-treasurer; C. H. Clapp and C. D. Demond, additional members of executive committee. H. B. Pulsifer, professor in the Montana School of Mines at Butte, then read a paper on the 'Metallurgy of Aluminum and Magnesium'; and J. C. Horgan, of the Du Pont Powder Co. read a paper on the manufacture of 'High Explosives and Their Use in Metal Mining'. J. J. Carrigan, in discussion of Mr. Horgan's paper, told how the Anaconda had saved many thousands of dollars through 'propaganda', inducing the miners to make proper use of tamping.

The Boston & Montana Development Co. is designing a 500-ton concentrator for its property near the head of Wise river in the Elkhorn district, Beaverhead county. Construction will start as soon as practicable in the spring. The Montana-Southern railway, connecting the company's property with the Oregon Short Line at Divide, will be completed early in the spring. Part of the equipment is already on the ground. Work has also been started on the transmission-line from the Montana Power Co.'s plant on the Big Hole river. The mine and mill are to be electrically equipped

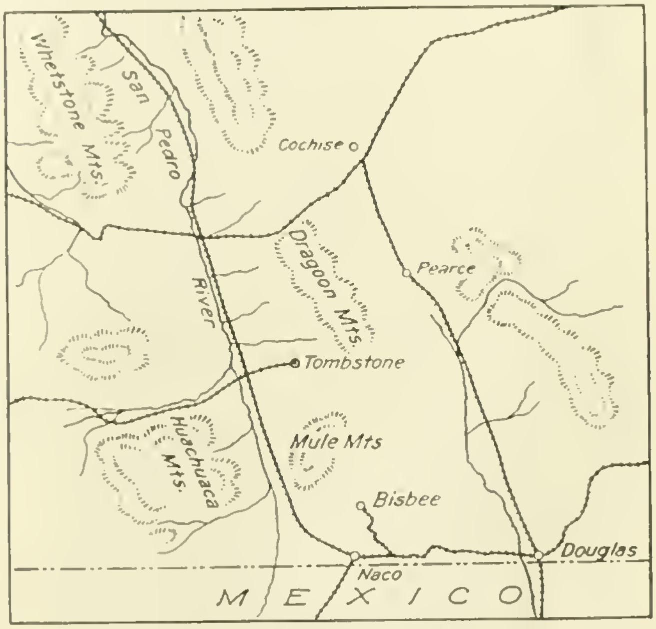
BISBEE, ARIZONA

General Exploration.—Treatment of Mineral Water.—Work at Tombstone.—Placer Gold in Ash Canyon.—California District.—Pearce and Middlemarch.

The shaft of the Denn-Arizona Copper Co. has passed the 1800-ft. level, which, with the exception of a sump 30 ft deep, is the bottom for the present. Stations are to be cut at 1700 and 1800 ft., and exploration drifts started on both levels. It is confidently expected that the orebodies partly developed between the 1000 and 1600-ft. levels will be found at this depth. Results are being watched with great interest by the Warren district, as through this property alone can the ground in the extreme north-eastern zone be explored.

At the Shattuck Arizona copper production for January was a trifle less than that for December, and it is rumored that there is likelihood of further decrease for February. Operations are now more limited than during December or in early January, owing to the cessation of extraction of lead-silver ores, closing of the flotation plant, and the discharge of men employed in this division.

As a result of the recent flooding of the shaft of the Great Western mine at Courtland, when so heavy a head of water was encountered between the 200 and 300-ft. levels that it could not be handled by the pumping equipment, the property is now practically closed. In the meantime engineers have investigated the position, and more pumps may be put in. So strong is the head of water that a well at the foot of the slope in which the shaft was sunk, in which the water formerly stood a number of feet below the surface, has developed a considerable artesian flow. The shaft is a new one, upon which and its equipment the company is reported to have expended considerable money.



PART OF SOUTHERN ARIZONA.

One of the most interesting developments in the Warren district was the starting of a Reisert water-treating plant by the Phelps Dodge Corporation, Copper Queen branch, late in January. The water, obtained from the Junction mine of the Calumet & Arizona company, when treated, will be used in the steam-shovels and locomotives on Sacramento hill. Treatment of the water consists of the use of barium carbonate and lime which precipitate the soluble sulphates, the scale-forming constituents of the water in its natural state. Scaling of boiler tubing and its consequent short life in service has been a problem of more than ordinary vexation to the mining companies of Bisbee. Its elimination will mean a great saving. No announcement as to results from the plant have been made.

The Night Hawk Leasing Co., composed of Bisbee capital, shipped a carload of ore from its property near Don Luis in the south-eastern corner of the Warren district, to the Copper Queen smelter at Douglas last week. This is the third lot of ore sent from development, which has been encouraging.

Reports from Tombstone state that a number of Bisbee miners, presumably anticipating a long lull in copper activity, with possible reduction in mining forces, have made inquiries of the management of the Bunker Hill company relative to leases on portions of its ground. In part these inquiries are attributed to the high price of silver and the fact that several small deposits of good-grade ore are known to be on the Bunker Hill near the surface.

The Hershel Mining Co. at Tombstone is about to start work at its mill, the machinery having been overhauled and put in shape for a run by the manager, Douglas Gray.

One effect of the cessation of the copper boom has been to send many miners to the hills between Tombstone and the old camp of Charleston. At the latter several prospectors are working old silver-lead mines in a small way.

An effort to develop a sufficient head of water for sluicing operations, by which it is believed gold could be recovered in Ash canyon in the Huachuca mountains, 40 miles from Bisbee and 14 miles south-west of Hereford, is now being made by A. R. Bergquist, Dan Leedy, and Charles Morgan of Bisbee. A few men are driving a tunnel. For some time Ash canyon has been known to contain placer gold, several nuggets having been picked up in the bed of the small stream flowing through it. However, the sand was too wet for dry washing, while the water was insufficient for sluicing. A number of Bisbee people hold placer or lode claims in the canyon or on the hills surrounding it.

In the California mining district, surrounding Paradise in the eastern part of Cochise county, near the New Mexico border, several mines are working successfully. The Hill Top Metal Mines Co., a Kansas City corporation, has cut a vein in its second tunnel on the south side of the Chiricahua mountains, at a distance of 200 ft. from the mouth. Indications are favorable for a large body of ore to be developed by further driving in the lower tunnel, which has a total vertical depth of 900 ft. The orebody already has been proved from the upper tunnel, which extends entirely through the mountain, to the second tunnel 400 ft. down the mountain side. The third tunnel is in 1350 ft. and must be driven approximately 3000 ft. before finding the ore, which is dipping away from the tunnel mouth. The middle tunnel has developed a fine flow of water, making 1000 gal. per min. Approximately $750,000 has been spent on the property of which J. O. Fife is manager. Good wagon-roads have been built by the company to Rodeo, New Mexico, its present shipping point. It is currently reported that a railroad is to be built by the company, but whether it will tap the El Paso & Southwestern at Rodeo, or the Southern Pacific at Dos Cabezos, is not known. The company also is reported to be considering a smelter. Machinery, including a large engine of the Diesel type and a compressor, were installed some time ago. There is ample timber in the hills close-by for general use. The ore carries copper, lead, and silver. About 30 men are employed.

At the Hill Top Extension, adjoining the Hill Top, under the management of John Blumberg, the tunnel is in 750 ft. on the vein. At present a carload of lead-silver carbonates, carrying 60% lead and 50 oz. silver, it awaiting shipment, but recent heavy snows froze the ore in bins, delaying matters.

The King Copper mine, operated by C. E. Welch, a merchant of Paradise, is driving on the 300-ft. level on the main vein. A good grade of copper ore has been opened for 80 feet.

The old surface workings of the Commonwealth company at Pearce, Cochise county, are being exploited by lessees under the direction of A. Y. Smith, manager for the Commonwealth. Approximately 750 tons of highly silicious ore is shipped each month to the C. & A. smelter at Douglas, where it is ground and used mostly for converter lining.

The Middlemarch Copper Co. has finished sinking its new shaft, according to arrivals at Bisbee, who say the present intention is to drive on the lower levels to the contact where ore has been developed on upper levels. The shaft was sunk both to develop ore and bring in a supply of water, if possible, for the mill. A lack of water has been felt keenly in the past. The flotation mill has operated with unusual success as far as recovery is concerned, it is reported. E. L. Elson is manager. The mill was described in the 'Press' of February 8, 1919.

PLATTEVILLE, WISCONSIN

Zinc, Lead, and Pyrite During January.

January as a rule is not responsible for large production in the zinc-lead districts, and this year a combination of restrictive influences preclude the possibility of even a fair showing. Prices for ores declined. Local mining exchanges, ordinarily looked to for current weekly quotations, deliberately avoided publishing figures in the first two weeks of the month. Buying was restricted, two prominent smelter companies, locally represented, withdrew for a time. Operating costs have become unendurable, and since no relief is being afforded through lower costs of mine and mill supplies, many consistent low-grade producers have shut-down. Some are gradually working off enough surplus product to keep mines dewatered and plants ready in case of an improvement. The spring-like weather experienced through the month, in one of the mildest winters this field has known in 30 years, offered sufficient incentive for a large yield; but operators were content to go along as conservatively as circumstances would permit, and both recoveries and shipments were exceptionally light when compared with previous records. Physically, the industry is better organized than in a great many years, and new high outputs are possible under fairly normal conditions.

Lead-ore producers suffered adversity, prices declining abruptly at times, bringing quotations down to $55 per ton, base, 80% lead, with a poor demand. The mild weather has enabled small operators to continue gophering through shallow and surface diggings, with the result that at the end of the month a fair surplus was held in bins.

Carbonate of zinc producers enjoyed a fair month, the price holding at about $25 to $35 per ton, 40% metal, all the month. New strikes made in the northern districts of the field, in virgin soil, of more than ordinary importance, give better prospects of an increased output. The outlet too, is of a more substantial nature, the ore going almost entirely to the Mineral Point Zinc Co. for the manufacture of zinc oxide. Prices for the latter rule high, and until white lead makes a sufficient fall to make inroads here it is believed that mining will be conducted at maximum capacity. More miners were taken on, and no attempt was made at any point, in the field, in fact, to reduce wages.

Shippers of pyrite, although regaled with high prices for sulphuric acid, found the markets for this ore entirely to their dislike and not a pound of ore of this class was marketed during the month, something that has not occurred in the field in a dozen years. A fair reserve has accumulated, held, mainly, at refinery plants engaged in zinc-ore separation.

Deliveries of zinc ore from mines to refining plants in the field, and from mines direct to smelter for January amounted to 12,826 tons; and of lead ore, 331 tons. Refiners delivered to smelters 3659 tons of blende. The Mineral Point Zinc Co.'s output and purchases totaled 5227 tons.

TELLURIDE, COLORADO

General Conditions in This Part of the San Juan.

The sharp decline in the price of lead and copper will not affect this district as seriously as adjoining ones, owing to the nature of the ores, which carry high gold and silver contents, and comparatively small low quantities of base metals. During the past month there has been a steady influx of labor, both common and skilled, due to the shut-down in the Rico district, the laying-off of miners in Arizona, and the return of soldiers. Although the labor supply now exceeds the demand, the present wage-scale will be maintained until such a time as the lower cost of living permits less wages. The relieving of the acute labor shortage is shown by heavier production and development work.

The Tomboy Gold Mines Co. is now shipping 50 cars of concentrate per month, and as the ore carries mainly gold and silver, the drop in other metal prices will not seriously affect earnings of this company. Work on the new flotation plant is to be started as soon as snow conditions permit. The plant will recover the zinc in the ore, which hitherto has been lost.

The Smuggler Union company is producing larger quantities, as all properties are working. The Black Bear is shipping 5 cars per week; the Humboldt, 5 cars; the Colorado Superior, 13 cars; and the Caruthers Lease, operated by Inamo & Perino, 1 car.

The Belmont-Wagner company continues extensive development at the Alta mine, and is rapidly getting the mine in condition for the season's run. As there is now plenty of labor to draw upon, the mine and mill will be operated at full capacity as soon as snow conditions permit resumption of outside work.

The Mt. Blaine Oil Shale Co. has everything ready to resume operations in the spring. An abundant supply of good water is now assured at the plant, as a large tank has been constructed of 7000-gal. capacity, water being piped thereto from a nearby creek.

VICTORIA, BRITISH COLUMBIA

Smelter Investigation.—Work at Trail.—Ladysmith Smelter.—Mining Convention.—Closed Towns.—Mine-Rescue Apparatus.

At the opening session of the committee appointed to inquire into the fairness or otherwise of the treatment rates charged on custom ores by the Consolidated Mining & Smelting Co. at Trail it was explained by S. S. Fowler, the chairman, that evidence either in the nature of criticism or suggestion would be heard from anyone. Such evidence might be given orally or in writing. It had been decided that, where witnesses made the request, their testimony would be heard en camera and would be treated confidentially. Members of the committee, after taking the evidence of one witness behind closed doors, decided that they would visit the Trail smelter and meet representatives of the company in order that necessary arrangements might be made for investigation into operation of the plant.

Notwithstanding the present unsettled condition of the metal markets, the smelter of the Consolidated M. & S. Co. is as busy now as it was some months ago and has more men on its payroll. The explanation of this is briefly that the management is preparing for the time, expected soon, when there will be a big demand for the products of the plant. One of the most important projects is the construction of a concentrating plant in connection with the zinc plant for dressing the tailing of the Sullivan mine and other silver-lead-zinc ores after they have passed through the electrolytic process. There is an immense quantity of this residue, which has been accumulating ever since the electric process was started, because there was no known practical method of extracting the lead. This problem has been solved by the company's chemists.

Progress is being made in development of the fluorspar property of the Consolidated M. & S. Co. near Grand Forks. Eighty two men are employed there. The tram-line being built to convey ore from the mine to bunkers for shipment is nearly completed. At the bunkers a mill is being erected to grind the ore before shipment. The mill-site is to be connected with the Kettle Valley railway by a branch line, which is under construction.

There is a prospect that the Ladysmith smelter will be in operation again before long. W. J. Watson, in charge of the plant, has just returned from a conference with F. A. Seiberling, of Akron, Ohio, and associates. He states that it is Mr. Seiberling's intention to commence, without delay, the development of several good mining properties. One of these is on Latouche Island. Other first-class prospects have been secured and will be opened as fast as possible.

The president of the Associated Boards of Trade of eastern British Columbia, Fred A. Starkey, has announced that the Northwest International Mining Convention will be held at Nelson this year.

Legislation is proposed by the Hon. T. D. Pattullo, Minister of Lands for British Columbia, that will affect the policy of the Granby Consolidated M. & S. Co., as well as other mining and manufacturing companies, of maintaining what are termed 'closed towns' in those areas near their plants where homes are provided for officials and employees. The companies' explanation for their course in this regard is that it is in the interest of their business that agitators, idlers, and people with no particular business, shall be kept out of such centres. On the other hand, the Minister of Lands takes the position that the right of any private corporation to arbitrarily prohibit intercourse between the members of its particular community with the outside world is questionable, that it results in the restraint of free competitive trade, and is an unjustifiable interference with the freedom of the subject. It is not proposed by the Government, however, to place any law on the statutes that will force the companies to throw open their towns to the same extent as are the usual run of municipal corporations. The Lieutenant-Governor-in-Council will be given power to declare certain communities company towns, within the limits of which the public shall have free right of ingress and egress over the ways and roads used by the companies as avenues of traffic, but it is not intended that the ways immediately adjacent to the works themselves and used solely in connection with actual industrial operations shall be deemed avenues of traffic. In other words the prohibition will be lifted as regards avenues of traffic that are in the townsite proper and on which are located the various public offices, public buildings, etc. Provision also will be made for wharf accommodation for public traffic and use in cases of those towns where water transportation is the only means of approach.

Notice has been posted at the Grand Forks smelter of the Granby Consolidated to the effect that it proposes to reduce wages of its employees.

The mining companies of the Golden and Windermere districts are organizing the Northwest Kootenay Mining Association, the object of which will be to encourage mining in that region.

Mining men and citizens generally of the Canadian West propose once more to ask the Dominion government to secure the passage of legislation placing a bounty of 50c. per ton on the production of pig-iron in Canada.

Acting on instructions from the Minister of Mines, the Chief Inspector of Mines has arranged for a series of practical tests of the Gibbs mine-rescue apparatus and the Paul breathing apparatus. These began on January 28 at the Government mine-rescue station at Nanaimo.

THE MINING SUMMARY

ALASKA

Jualin.—Work will be resumed at once on the property of the Jualin Alaska Mines Co. at Jualin. This property was taken over in 1912 by the Aigunican Development Co., a Belgian and French company with head office at Brussels, Belgium. At the time a 7800-ft. tunnel was started, intended to cross-cut the vein system at a lower depth, also to drain the mine. This tunnel, which had advanced 2000 ft., was discontinued when war broke out, attention being confined to the actual production of the mine. All work was suspended in November 1917, owing to labor shortage and extreme operating conditions. During the last year of its operations the mine produced nearly $200,000 of gold from a 10-stamp mill. It is now proposed to complete the tunnel, at the same time carry out extensive development from the present workings. Until the tunnel is completed no ore except that obtained from the development will be milled. Jean Vanophem, Brussels, Belgium, is president, and Charles G. Titus, Juneau, Alaska, is general manager.

Kennecott.—Copper production of the Kennecott company has been reduced by about 50%.

ARIZONA

Ajo.—New Cornelia produced 4,318,000 lb. of copper in January, an increase of 70,000 pounds.

Bisbee.—The Oliver shaft of the Calumet & Arizona Copper Co. has been closed for an indefinite period. This shaft was opened at the commencement of the War. The ore extracted was low-grade, however. The January output was 2,284,000 lb., a reduction of 620,000 pounds.

Globe.—Old Dominion produced 2,812,000 lb. of copper in January, a gain of 130,000 pounds.

Jerome.—Charles H. Moyer, president of the Industrial Union of Mine, Mill, and Smelter Workers, in a statement made at Denver on the 11th on the action of miners in the Jerome copper district in striking as a result of a cut in wages, said: "These men are members of the I. W. W., and are in no manner connected with the Mine Workers' Union. Our men in the Jerome district are satisfied with their contract with the mine-owners, and have been expecting a wage reduction. The men responsible for the disturbances at Jerome are members of the same branch of the I. W. W. that has created all of the trouble in Butte."

Several I. W. W's were arrested on the 12th and 13th. The United Verde Copper and United Verde Extension mines and works were closed indefinitely during the week.

Miami.—The Miami Copper Co. has so far not reduced its scale of operations.

Inspiration produced 6,500,000 lb. in January, a drop of 850,000 lb. from December.

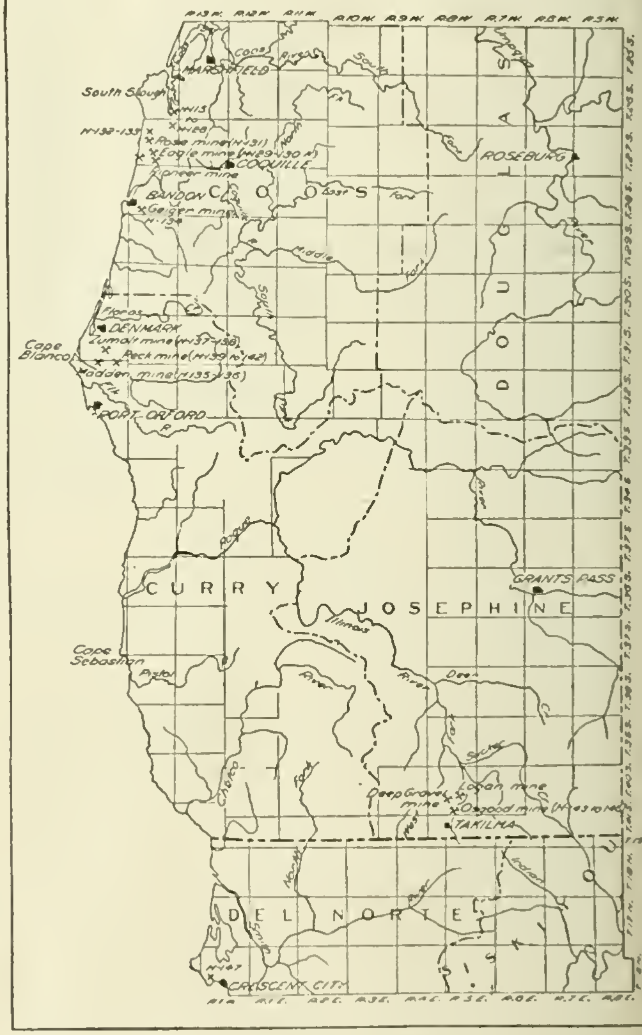
Tombstone.—A few men are at work at the Hershal mine opening lead-silver ore. Shipments are expected to be started in the near future. In the past, ore valued at $5000 per car has been shipped from this property.

The high price of silver is encouraging prospecting in the old Charleston district.

Wenden.—Officers of the Black Reef Copper Co., operating near here, have been requested by the Arizona Corporation Commission to make explanation of the alleged sale of shares after the expiration of its selling-permit of July 1, 1917.

CALIFORNIA

Crescent.—Mention was made editorially in the issue of February 1 of the views of R. R. Horner in Technical Paper 196 of the U. S. Bureau of Mines on platinum in the black-sand deposits of northern California and southern Oregon, wherein he considered that this metal did not exist in payable quantities, save in a few spots, so now a map is appended to show where the investigations were made. The chief difficulties in the profitable exploitation of the sand is lack of uniformity in occurrence and metallic content, and the high cost of mining and treating the minerals.



MAP OF PART OF OREGON AND PART OF CALIFORNIA SHOWING SITUATION OF BLACK-SAND DEPOSITS SAMPLED.

Engelmine.—The Engels Copper Mining Co. held its annual meeting at San Francisco on the 11th. Gross earnings totaled $1,781,637, of which $479,173 was profit. Dividends totaled $269,979. Improvements and investments in Liberty bonds amounted to $424,560. The general manager, E. E. Paxton, estimates reserves in the mine as 2,275,000 tons, a large increase; while drilling has disclosed much more, so that 5,000,000 tons is confidently expected in 1919. The mill treated 265,000 tons of ore, yielding 9,500,000 lb. of copper. Recovery was 78%. The total production cost was 19.58c. per lb., but this is now 16½ cents. "Electric power, rail transportation, and tailing disposal having been provided, three ot our big problems have been solved," says Mr. Paxton. "The company is now fully equipped for successful and economical operation, and with mill additions to be made in 1919 we will rank among the country's largest producers of the red metal. With the natural advantages of timber and water-supply, and attractive living conditions on the property, results of the company's operations should compare favorably with any of the large mines of the country."

Grass Valley.—After months of negotiation a merger of the Idaho-Maryland and Union Hill companies and several lesser claims have been united in one corporation known as the Gold Point Consolidated Mines. The land involved extends over two miles in length on the Idaho-Maryland lode, and embraces an extensive vein system, the greater part of which is virgin ground. A new vertical shaft is to be sunk at some central point. Prior to the War, Errol MacBoyle and associates took over the Union Hill mine. Later the Gold Point company absorbed all interests and elected Bulkeley Wells as president with the following directorate: Bulkeley Wells, Edwin L. Oliver, F. W. McNear, John McCrossen, Roy H. Elliott, Rufus Thayer, and Errol MacBoyle. No change in the present operations at Union Hill is contemplated, but the trend of the new development will be toward the Idaho-Maryland ground. To Mr. MacBoyle is due the credit of bringing the various interests together.

Kennett.—On February 14 the Mammoth Copper and Balaklala Copper companies posted notices that on February 16 wages would be reduced 50 cents per day all around. The Mammoth employs 550 men, the Balaklala 170. The present wage-scale base on 30-cent copper gives miners $4.50, shovelers $4, and common laborers $3.52 per shift. The Mountain Copper Co. has not made any announcement so far.

Redding.—A contour survey is being made of the Greenhorn group of copper mines near Tower House, under the direction of the general manager, Albert Hanford. There are 10 full claims, 2 fractions, and 260 acres outside of the mining ground. Fifteen men are employed underground on development. No attempt is being made to extract and ship ore.

Weaverville.—High water in the Trinity river carried away the levee protecting the Valdor dredge on the Heurtevant claim below Junction City. No damage was done to the dredge, further than that it was left high on the sand, and a rubber belt costing $1800 was swept away. It will take 10 days to re-build the levee and sluice away the sand around the boat.

COLORADO

Boulder.—The Colorado Pitchblende Co., in full-page advertisements in Denver papers, states that the Jimtown radium and uranium find is vindicated, according to the report of M. S. MacCarthy, who was appointed by an outside association to make an examination. With a 1000-ton plant, a daily profit of $9140 is expected. This matter will be discussed editorially in another issue of the 'Press'. People are now advised by the company to buy shares, and make each dollar invested earn an indicated $3.29 per annum.

A company is being formed at Boulder to purchase the Chamberlin sampler, the purchase-price being $10,000. Employment will be given to 75 men.

A rich 'vein' of platinum is reported from Pandora mountain, near Caribou. J. I. Elsberry and E. E. Smith are part owners with Denver people. Assays from 10 in. of ore returned $.50 silver, $20 gold, some lead, and $8 to $15.80 per ton in platinum.

Central City.—The Fairfield mine, at the head of Russell gulch, recently unwatered after being unworked for over 10 years, is being opened by J. Thouveneil for Eastern people. Some rich gold ore is being extracted.

The 'Gilpin Observer' is rather pessimistic about gold, and said in part: "There is no use of our trying to reason that things in a mining way will be any better during the coming year than they have been in 1918, unless there is a re-adjustment of conditions to a pre-war basis. . . ."

Durango.—The local smelter is working three shifts. According to the manager, R. P. Raynolds, in 1918 there was received 470,256 tons of ore, yielding 132,253 oz. of gold, 9,236,058 oz. of silver, 86,575,999 lb. of lead, and 6,169,057 lb. of copper, Colorado ores accounting for 126,927 oz., 5,239,318 oz., 54,131,063 lb., and 5,350,094 lb., respectively.

Leadville.—The Down Town Mines Co. in 1918 produced 70,000 tons of ore, valued at $755,000. There was a great variety of ores marketed, the Penrose shaft yielding silver-lead carbonate, zinc carbonate, silver-copper-lead carbonate, silver-copper-lead sulphide, manganese and silver-iron; and contained seven metals; gold, silver, lead, copper, zinc, manganese, and iron. A fair tonnage, which is included in the company total, was extracted through the Bohn, Hibschle, Grey Eagle, and P. O. S. shafts, where small syndicates operated sub-leases.

IDAHO

Mullan.—The Copper King M. & S. Co. has optioned its property to Tacoma and other people, represented by J. M. Jackson, for $250,000, on terms. Certain development is to be done, also a 50-ton mill erected. H. W. Ingalls is secretary of the Copper King.

Wallace.—The Success has been closed, pumps were withdrawn, and the workings will be allowed to fill with water, until the lead and zinc markets improve. About 75 men are affected. A new orebody has been opened for over 100 ft. on the 1400, 1500, and 1600-ft. levels. An assessment of 2 cents per share was levied recently.

MISSOURI

Joplin.—In Bulletin 154 of the U. S. Bureau of Mines, mining and milling of lead and zinc ores in the Missouri-Kansas-Oklahoma zinc district is fully described by Clarence A. Wright, who co-operated with the Missouri Bureau of Mines and Geology. The publication covers 134 pages and is well illustrated.

Production of the Tri-State region last week was as under:

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	1,744	...	350	$93,242
Missouri	2,707	398	131	88,209
Oklahoma	7,012	...	764	343,536
Average price..	$42	$25	$54	......

MONTANA

Anaconda.—By the probable construction of a highway from Anaconda to Hamilton, the old Moose Lake mining district will be re-opened; also the Frog Pond district, immediately south. The ore carries gold.

Butte.—A summary of events in the labor dispute last week includes the following:

Early in the week troops arrived to maintain order if necessary.

Practically no ore is being sent to the Washoe and Great Falls reduction works.

The Anaconda company's acid plant was stopped on the 12th, dispensing with 50 men.

Open warfare on the high cost of living was declared by the mining companies, when a committee from the mine-owners visited local merchants and asked that they make some move to reduce the price of merchandise, rents, and other necessities. Unwillingness to do so on the part of Butte dealers will probably mean that either the local mines will announce an indefinite closing of the properties or that stores will be opened for the sale of goods at cost to all employees. This action was determined upon by mine operators after they had met with Major A. M. Jones of the 44th Infantry.

The strike was declared off on the 17th.

Zinc output of Butte & Superior in January was 9,450,000 lb., also 178,000 oz. of silver. This is a reduction of 1,200,000 lb. when compared with December.

NEVADA

Ely.—Nevada Consolidated reduced wages 75 cents per day last week. The notice posted by C. B. Lakenan, the general manager, includes the following wage reductions when copper is under 26 cents per pound:

	Over $4.35 per shift	Under $4.35 per shift
Between 26 and 25 cents......	12.5c.	12.5c.
" 25 " 24 "	12.5c,	12.5c.
" 24 " 23 "	12.5c.	12.5c.
" 23 " 22 "	12.5c.	12.5c.
" 22 " 21 "	12.5c.	7.5c.
" 21 " 20 "	12.5c.	7.5c.
" 20 " 19 "	12.5c.	7.5c.
" 19 " 18 "	12.5c.	7.5c.

The above scale takes into account the present cost of living, and is subject to revision as living costs decrease. When copper sells below 18 cents there will be a further consideration of the wage-scale.

Goldfield.—An agreement between the Spearhead and Booth companies, whereby the latter receives 250,000 shares of the former in consideration of surrendering all extra-lateral and apex rights, was signed in Reno on the 13th. The Spearhead followed the example of the Jumbo Extension, Merger Mines, Kewanas, and others which made share settlements rather than engage in apex litigation.

The new company taking over the Goldfield Consolidated properties is the Goldfield Development Co. A charter under the name of the Goldfield Mining Co. was refused by the Secretary of State because of the former existence of a company with a similar name. Officers and directors are Corrin Barnes, president; A. I. D'Arcy, vice-president and manager; H. G. McMahon, secretary and treasurer; with A. H. Howe and Ben J. Henley.

Tonopah.—The East Divide company has acquired the Alto claims in the Divide district. R. G. Williams was the owner, while the buyers were C. S. Sprague and others. The Alto claims are around the east end of the Gold Zone property. The ground is considered to have good possibilities.

Production of the district last week was 7229 tons of ore valued at $122,893. Of this, 210 tons came from the Tonopah Divide.

The Belmont in January treated 9290 tons for 1130 oz. of gold and 114,998 oz. of silver, giving a profit of $57,092.

The Tonopah Mining Co. sent 4925 tons to the Belmont mill, yielding 950 oz. of gold and 85,300 oz. of silver, and a profit of $42,000.

The Extension is preparing to sink its Victor Shaft below 1760 feet.

The Jim Butler is also to sink deeper, starting at the 800-ft level.

OKLAHOMA

Picher.—While a good number of mines are closed, there are still many at work. Stocks of concentrate are rapidly decreasing.

Tailing from the Netta mine here is now delivered into railroad cars by a flume, erected by the Independent Gravel Co. The daily shipment is 23 carloads from the flume, and two from the conveying system. The tailing (flint or chert) is used as ballast, in concrete, and on highways.

OREGON

Bandon.—From this place in Coos county small quantities—300 to 500 lb.—of chromite are being sent to San Francisco by H. M. Axtell, superintendent of the black-sand plant at Camp Day. The chromite is separated from the black sand. David T. Day of the U. S. Geological Survey is said to be owner of the plant.

TEXAS

Austin.—The new mining bill before the Legislature is expected to pass. It provides for the location of minerals on all State land or lands on which the mineral rights have been reserved by the State. All placers, veins, lodes, or any rocks, or aqueous solutions carrying metallic or non-metallic substances of value, except oil, natural gas, coal, and lignite, can be located under the provisions of this act. The size of claims is placed at 1500 ft. in length by 600 ft. in width as the maximum. The extra-lateral rights are excluded, saving the endless litigation under the United States law.

UTAH

Alta.—The Emma Consolidated and Old Emma Mines companies are to be amalgamated. The latter and the Emma Copper Co. were controlled by Emma Consolidated, which arrangement tended to oppress the others, the only remedy being to eliminate the holding company. A new company with 5,000,000 shares is suggested.

The South Hecla Mining Co. had net current assets amounting to $113,363 at the end of 1918. Ore production was 6912 tons, valued at $180,021, of which $69,849 was profit. The metal contents were 104 oz. of gold, 89,173 oz of silver, 111,616 lb. of lead, 502,924 lb. of copper, 71,560 lb. of zinc, and 3,961,781 lb. of iron. Lessees produced 2322 tons of ore, worth $35,472, of which the company's share was $3855.

Bingham.—The Utah Copper Co. continues to strip over-burden, in spite of the fact that the work is a long way ahead of ore extraction.

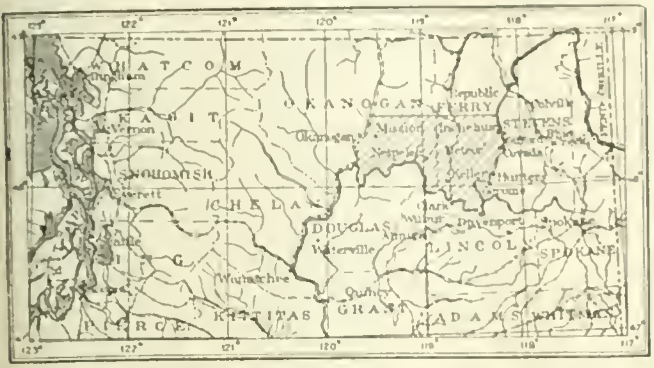
Morrissey.—The Utah Sulphur Co. is to construct a railway to its property here, according to M. S. Morrissey, general manager. More equipment is to be added.

Park City.—Production of this district in January totaled 10,880 tons of ore and concentrate, compared with 8468 tons in December. The producers were: Judge M. & S., 2880 tons; Ontario-Silver, 2779; Silver King Coalition, 2220; Daly, 1012; Daly Mining, 700; Naildriver, 360; Silver King Con., 185; and miscellaneous 500 tons.

WASHINGTON

Spokane.—The blue sky law presented to the State Legislature by Representatives from Chehalis county has been condemned by the Northwest Mining Association. "The bill contains some points that are good," said F. C. Bailey, secretary of the Association, "also it contains some that are vicious. It would permit me to dispose of 1000 shares of personal stock for a personal benefit, but would deny me the right to sell 100,000 shares for the benefit of the mine and its stockholders, unless I submitted to a burdensome and expensive investigation."

Keller.—Geology and mineral deposits of the Colville Indian reservation in Okanogan and Ferry counties are discussed by J. T. Pardee in Bulletin 677 of the U. S. Geological Survey. The total metal output, excepting placer gold, up to 1912 was not over $25,000. The placers are of relatively little economic importance. The metal-bearing lodes are those of most interest at present. Silver is the principal constituent in most of the veins and shear-zones. As a rule, lead is associated with the silver, in some deposits of equal value. Zinc is almost as widely distributed as lead, but at present it is commonly penalized by smelters. Copper is present in many deposits, but save in some shear-zones and disseminated deposits it is of little value. Gold occurs sparingly in most of the lodes, but in few does it add materially to the value of the ores. Antimony and molybdenum are possibly important in exceptional localities. The Nespelem, Park City, Sanpoil (Keller), and Covada (Enterprise) district possibilities are described in detail in this 186-page publication.



MAP SHOWING COLVILLE INDIAN RESERVATION, WASHINGTON.

CANADA

British Columbia

Ainsworth.—The Florence Silver Mining Co. pays 1½ cents per share, equal to $16,500, on March 20. It is expected that from now on monthly disbursements will be made. The mill produces lead-silver-zinc concentrate.

Anyox.—Mine operators and prospectors interested in the Alice Arm district were pleased to read a recent Toronto press dispatch regarding the ownership of the Dolly Varden mine that reads as follows: "The shareholders of the Temiskaming Mining Co. at their annual meeting yesterday (February 4) consented to the proposal of the directors to extend the operations of the company by taking over the Dolly Varden and Wolf silver mines in British Columbia. These mines have been handicapped for some time owing to lack of finances and the Temiskaming company has entered into an agreement whereby operations will be resumed. The purchase price of the properties is $900,000, but the obligation to the former holders of the mines is only $450,000, because of the liabilities the Temiskaming company has to assume." The railroad from the beach at Alice Arm to the Dolly Varden mine was practically re-built and nearing completion when the construction company went into liquidation, with the result that most of the mining properties and prospects of the district were tied-up. Hopes were entertained, however, that an early adjustment of the railroad difficulties would be arranged and negotiations to that end were started. The Dolly Varden Mines Co.'s mine is 18 miles from tidewater, on the west bank of the Kitsault river, while the Wolf mine is two miles farther up on the east bank of the Kitsault. The former has been extensively opened underground, and is therefore in condition to start shipping at any time. The orebodies have been exposed by much diamond-drilling. At the Wolf a tunnel proves the orebody for a width of 60 ft., with neither wall in sight. Several thousand feet of diamond-drilling has been done showing ore to be of good milling grade.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

G. C. Bateman, of Cobalt, Ontario, was in San Francisco last week.

D'Arcy Weatherbe returned from China on February 12, and has gone to London.

John Wellington Finch was here on his way from China, and has gone to New York.

James B. Pearce has been appointed engineer with the Inspiration Copper Co., at Inspiration, Arizona.

Chester B. Neiswender is connected with the concentrator of the Inspiration Copper Co., at Inspiration, Arizona.

Jerome J. Day, of Moscow, was elected president of the State Mining Association to succeed **Stanly Easton** on February 12.

Horace F. Lunt has been honorably discharged from the Engineer Corps of the Army and has returned to Colorado Springs.

J. W. Crowdus, First Lieutenant of Engineers, has received his discharge and has returned to his consulting practice at El Paso, Texas.

S. J. Kidder has resumed the management of the Mogollon Mines Co., at Mogollon, New Mexico, having completed his work with the Engineer Corps.

E. W. Bullard, Lieutenant in the U. S. Army since the beginning of the War, has returned from France, and will take up his old position with his father, E. D. Bullard, in the mine lamp and mine safety supply business.

J. H. McMillan, Provincial District Inspector of Mines for the Prince Rupert district, has resigned in order to become general manager for the Jasper Park Collieries, Ltd., operating in the Province of Alberta, with headquarters at Pocahontas.

The Utah Society of Engineers held its regular meeting February 19 when there was given a symposium on potash. The papers were: 'The General Potash Situation,' by F. L. Cameron, U. S. Bureau of Soils; 'Recovery of Potash at the Ogden Portland Cement Plant,' by O. C. Hart; 'Potash from Leucite Rock,' by Guy Sterling; Nebraska Potash Brines,' by Dr. W. D. Bonner; 'Potash from Alunite,' by Mr. Cohen, chemist for Mineral Products Co.; 'Agricultural Uses of Potash,' by E. M. Ledyard, agricultural director for U. S. Smelting Co.; 'Potash from the Great Lakes,' by H. A. Margetts, superintendent for the Solvay Process Co.; 'Proposed Government Syndicate,' by A. E. Wells, U. S. Bureau of Mines; 'Recovery of Potash from Blast-Furnaces by the Cottrell Process,' also 'The Possibilities of Getting Potash as a By-Product from Other Industries,' by other speakers.

Obituary

D. T. Leonard, metallurgist in Rhodesia, died in November from pneumonia.

Dennis Reardon, prominent in the Coeur d'Alene, Idaho, district, died at Los Angeles on February 1. His wife died two weeks previously.

Sherman H. Boright, mining engineer at the Lonely Reef mine, Rhodesia, died from pneumonia last November. He was born in Canada in 1881, receiving his education at McGill University.

Elmer Higginbotham, mill superintendent at the Oronogo Circle mine, near Joplin, Missouri, for 10 years, died from pneumonia on February 9. He was born in Illinois in 1879. He leaves a wife and four children.

THE METAL MARKET

METAL PRICES

San Francisco, February 18

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	17.50
Lead, pig, cents per pound	5.25— 6.25
Platinum, per ounce	$108
Quicksilver, per flask of 75 lb	$90
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	16.00

EASTERN METAL MARKET

(By wire from New York)

February 18.—Copper is quiet and lower. Lead is dull though steady. Spelter is inactive and weak.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1 01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price(as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 40.05 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾ pence, and on December 13 to 48 7/16 pence.

The price of sheet-zinc has been reduced 2 cents per pound to the basis of 11c. for sheets and 10c., for plates, subject to extras and discounts. The market is now 4c. below the official price ruling when the War ended. Extreme annual fluctuations for the past 10 years are as under, in cents:

	High	Low		High	Low
1919	13.00	11.00	1914	8.75	7.00
1918	19.00	15.00	1913	9.00	7.00

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

The War Trade Board announced on February 1 that licenses for the importation of wolfram will be issued freely when the applications therefor are otherwise in order.

Announcement was made in Washington on the 17th that it had been decided to throw on the market surplus stocks of copper, brass, and lead held by the War Department. This decision was reached at meetings attended by officials of the Director of Sales' office, representatives of the lead and copper industries and officials of the U. S. Geological Survey. This will be done gradually, however, in order that prices may not be affected. Details of the plan for marketing the surplus metal stocks will be worked out later in a series of conferences at which producers will have full representation.

Eastern Metal Market

New York, February 11.

The markets all continue to be inactive, with consumers playing the waiting game. As bearing on the American situation, it is interesting to note that, taking the three major metals—copper, spelter, and lead—England today has stocks equal to over 66% of its annual pre-war imports of copper, over three times its normal import of lead, and over 110% of its imports of spelter.

Antimony is lower with demand light.

Copper continues to sell at lower prices on small transactions.

Lead is believed to have reached bottom, but demand is still light.

Tin market is dead and demoralized.

Zinc is a little firmer, but sales are not large.

ALUMINUM

The market is quiet. While Government maximum prices are to continue until March 1, the metal is obtainable at about 1c. per lb. under those levels, which were from 33 to 33.50c. per lb. in lots of 50 tons to 1 ton. This applies to No. 1 virgin metal and scrap.

ANTIMONY

The market is quiet with wholesale lots, duty paid, obtainable at 7 to 7.12½c. per lb., New York, for early delivery.

COPPER

Fundamentally the copper position is regarded by many as better. This is so because at the meeting at Washington last week virtually all the bad news came out. The worst is therefore unknown, and the situation is somewhat clarified. Representatives of producers and others laid their cards on the table, and showed the miners that among other things not more than 5% of the net output had been sold in the preceding 75 days, and at falling prices; also that there was probably 1,000,000,000 lb. of copper at smelters, refineries, in transit and otherwise, representing a sum of over $175,000,000. This has been interpreted as meaning that the cost to produce this was about 17.50 cents per lb. A further inference has been that this is an irreducible minimum as to selling-price. A billion pounds is said to represent over eight months' domestic consumption and export. The result of this meeting has been that miners' wages will be put on a sliding-scale with copper at 18c. During the last week the market has fallen further on sales of small amounts. The quantity disposed of would not be regarded by some as sufficient to make a market in normal times. Today, electrolytic copper is quoted at 18c., New York, and this could probably be shaded. Lake copper is nominal at 18.50c., New York. It is the opinion of some that the market has nearly if not quite reached a stable basis. Copper stocks in Great Britain on February 1 were 41,882 tons, an increase of 5882 tons over those on January 1.

LEAD

It appears not improbable that the lead market has reached the bottom, or close to it. Many regard the present level as attractive, and some consumers are displaying more interest than for some time. On Friday of last week, February 7, the American Smelting & Refining Co. again reduced its price to the level of the outside market or to 5c., New York, or 4.70c., St. Louis. The Independents have not cut this price, and the market is generally quotable at 5c., New York, or 4.70c., St. Louis, for early delivery. A buying movement is expected by some in the near future. If the market holds, buying is probable, if it goes down, it is also likely to start. One difficulty is the slow sales of lead products. Stocks of lead in Great Britain on February 1 were 76,193 tons, an increase of 13,641 tons over January 1.

IRON AND STEEL

Buyers still remain only indifferently interested, and it is being admitted that a further lowering of prices may be necessary to kindle a purchasing interest. There has been a lack of inquiry for about nine weeks, this being explained by some as due to the maintenance of too high a level of prices. How to get labor to recognize its share in any such readjustment is a problem. Steel ingot output in January, as estimated by the American Iron and Steel Institute, was 3,082,427 tons, or 90,000 tons more than in December. The January output was at the rate of 43,047,585 tons per year. Unfilled orders of the United States Steel Corporation on January 31 were 694,884 tons less than on December 31. The total was 6,684,268 tons, or the lowest for any month since October 1915.

TIN

There is no tin market, nor is any possible under present Government restricted conditions. Tin enjoys (?) the distinction of being the only metal still under control. If a rumor that is current proves true, there will be still less trading. It is to the effect that the authorities at present restricting the tin market may decide or have decided that there will be no further trading in outside lots by dealers, importers, or American smelters, until the unabsorbed allocated metal is disposed of. If this should be so, some predict violent opposition. It is stated that already purchase licenses for lots of over five tons of American 99% tin have been refused. The market is dull and devoid of interest. Straits tin is quoted at 72.50c., New York, the fixed price, as practically all the metal outside of the allocated tin has been sold. American tin, at least in small lots, under five tons possibly, is obtainable at 66 to 67c., New York. So far in February only 50 tons has arrived. Straits tin in London was quoted yesterday at £225 10s. for spot delivery.

ZINC

The market is a little firmer than a week ago, with prime Western quoted at 6.50c., St. Louis, or 6.85c., New York, for early delivery. The better tone is not particularly significant, although some think the market has touched bottom. The slightly higher level is attributed to the failure of a speculative movement late last week when spelter was sold as low as 6.25c., St. Louis, and also to a somewhat better inquiry from galvanizers. Grade A spelter is in poor demand, but is probably obtainable at 8 to 8.50c., base, compared with the former Government maximum price of 12c. The British stocks of ordinary spelter on February 1 were 23,905 tons, an increase of 1732 tons over those on January 1.

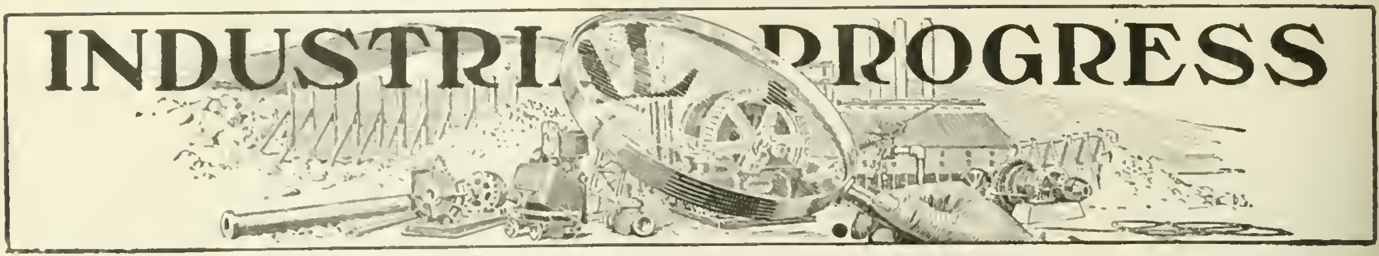
ORES

Antimony: No developments or quotations.

Manganese Alloys: Ferro is still quoted by producers at $225 per ton delivered, but carload lots of re-sale material are going now and then at $175 to $200 for early delivery. Small lots of spiegel have been sold in the past week at about $60 delivered for early shipment.

Molybdenum: Quotations continue nominal at 80c. to $1 per lb. of MoS_2 in 90% material.

Tungsten: There have been no developments, and quotations are absent because of no testing of the market. It is stated that ferro-tungsten can probably be bought as low as $1.50 per lb. of contained tungsten. If this is so, high-grade ore would sell at about $15 to $17 per unit in 60% concentrate.



INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

INSPECTION OF METALLIC-ELECTRODE ARC-WELDS

By O. S. Escholz*

Determining the character of welded joints is of prime importance. The lack of a satisfactory method, more than any other factor, has been responsible for the hesitancy met with among the engineering profession toward the extensive adoption of arc-welding.

The four factors that determine the physical characteristics of metallic electrode arc-welds are: fusion, slag content, porosity, and crystal structure. Some of the other important methods that have been suggested and used for indicating these characteristics are:

1. Examination of the weld by visual means to determine: (a) Finish of the surface as an index to workmanship; (b) length of deposits, which indicates the frequency of breaking arc, and therefore, the ability to control the arc; (c) uniformity of the deposits, as an indication of the faithfulness with which the filler metal is placed in position: (d) fusion of deposited metal to bottom of weld scrap as shown by appearance of under side of welded joint; and (e) predominance of surface porosity and slag.

2. The edges of the deposited layers chipped with a cold chisel or calking-tool to determine the relative adhesion of deposit.

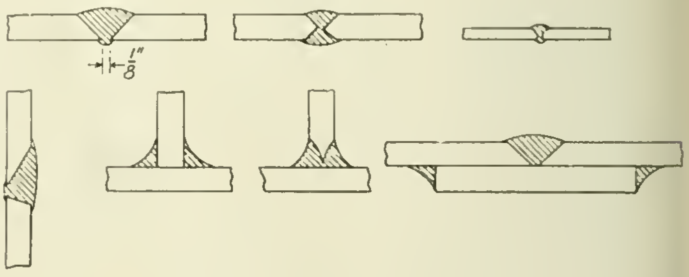
3. Penetration tests to indicate the linked unfused zones, slag-pockets, and porosity by: (a) X-ray penetration; (b) rate of gas penetration; and (c) rate of liquid penetration.

4. Electric tests (as a result of incomplete fusion, slag inclusions, and porosity), showing variations in: (a) electric conductivity; and (b) magnetic induction.

These tests, if used to the best advantage, would involve their application to each layer of deposited metal as well as to the finished weld. This, excepting in unusual instances, would not be required by commercial practice in which a perscribing welding process is carried out.

Of the above methods, the visual examination is of more importance than generally admitted. Together with it, the chipping and calking tests are of particular usefulness. The latter test serves to indicate gross neglect by the operator of the cardinal welding principles, due to the fact that only a very poor joint will respond to the tests. The most reliable indication of the soundness of the weld is offered by the penetration tests. Obviously, the presence of unfused oxide surfaces, slag deposits, and blow-holes will offer a varying degree of penetration. Excellent results in the testing of small samples are made possible by the use of the X-ray. However, due to the nature of the apparatus, the amount of time required, and the difficulty of manipulating and interpreting results, it can hardly be considered at the present time as a successful means to be used on the large scale production.

Kerosene, of the various liquids that may be applied, has marked advantages, due to its availability, low volatility, and high surface-tension. Sprayed on a welded surface it is rapidly drawn into any capillaries produced by incomplete fusion between deposited metal and weld scarf, or between succeeding deposits, slag inclusions, gas pockets, etc., penetrating through the weld and showing the existence of an unsatisfactory structure by a stain on the emerging side. A bright red stain can be produced by dissolving suitable oil soluble dyes in the kerosene. By the means of this test, the presence of faults have been found that could not be detected with hydraulic pressure or other methods. By the kerosene penetration, a sequence of imperfect structures linked through the weld, which presents the greatest hazard in welded joints, could be found immediately. This method is not applicable to the detection of isolated slag or gas pockets, nor small disconnected unfused areas. It has been shown by various tests, however, that a weld may contain a considerable amount of distributed small imperfections, without affecting, to a great extent, its characteristics. If a bad fault is betrayed by the kerosene test, it is advisable to burn out the metal with a carbon arc before re-welding under proper supervision. By means of the sand-blast, steam, gasolene, etc., large quantities of kerosene are preferably removed. No difficulty, however, has been encountered on welding over a thin film of the liquid.



COMMON TYPES OF ARC-WELD SCARFS

Electric test methods by which the homogeneity of welds are determined, are still in the evolutionary stages.

The inspector of metallic-arc electrode welds may consider that through the proper use of visual, chipping, and penetrating tests, a more definite appraisal of the finished joint may be secured than is possible in either riveting or concrete construction. The operation may be still further safeguarded by rigid adherence to a specified process.

Regardless of the metal welded with the arc, the cardinal in welding steps are: (1) Preparation of weld; (2) electrode selection; (3) arc-current adjustment; (4) arc-length maintenance; and (5) heat treatment.

The Holt Manufacturing Co., of Stockton, California, announces the appointment of Sutherland G. Taylor, Jr., as export manager. He assumed his duties at the Peoria plant on January 1. For several years he was vice-president and New York manager of Cyrus Robinson & Co., engineers and exporters of New York and London. Ever since the winter of 1914 the Holt plant has worked on British war contracts.

EDITORIAL

CONGRESS is still squabbling over the distinction between the Government's moral obligation toward the producers of chrome and manganese and toward those who supplied other materials without formal contract. The hair-splitters come chiefly from Missouri, Pennsylvania, and Ohio. The distinction depends upon whose ox is gored.

WHILE we hear so much about the increased cost of producing copper, it is refreshing to note that during 1918 the Engels Copper Mining Co. in California reduced its operating charges from 19.58 cents per pound to 16.50 cents on an output of over 9,000,000 pounds. This mine is one of great possibilities, where much interesting work is being done under the management of Mr. E. E. Paxton.

TUNGSTEN producers in this country will be interested to learn that the Burmese miners admit that ninety per cent of their output would cease if the price should fall below £3 per unit for 60% ore. The Portuguese mines continue in operation because of their long-time contracts with the French government at a price of £4 10s. per unit. The Burmese production comes almost wholly from the detrital deposits, the lodes having proved expensive to work. The opinion of foreign producers is that tungsten would become scarce if an attempt were made to reduce the price below the present level.

GEORGES CLEMENCEAU still lives! Let the world be thankful! To have lost the grand old man of France at this moment, when his clear understanding and sound philosophy are required to help restore an aching world to health and strength, would have been one of the calamities of the ages. He, in his own person, is the expression of France, of her mourning for those lost in the struggle for the survival of civilization, of her yearning for a safe and durable peace, of her indestructible faith in mankind to build better in the future. He also expresses more than that, for he is the needed coadjutor to help our own statesmen frame a universal democratic society of nations. Through his eyes are seen, as few others can see them, the political perils of Europe, for Clemenceau has grappled with them in the flesh for decades. It is with a feeling that Providence is guiding our destinies that we behold the great Premier laughing at his wounds, and returning with unclouded intellect to the paramount problems of peace.

IT is pleasing to note that the Bureau of Mines objected to the removal of restrictions upon the importation of graphite, thus displaying proper concern for an American industry which was created largely in response to the needs of the country in time of war. It appears that the War Trade Board disregarded this objection. The result will be helpful to foreign countries in the recuperation of their business. A circular issued by the Bureau of Mines says that large stocks of graphite had accumulated in France. Shipments of Ceylon graphite are also available. Our friends in Alabama and Pennsylvania would like to know what reciprocity arrangements are pending to cover the damage that is done to their investments for the production of graphite.

ON November 11 last year a truce was signed, and the nations rested on their arms, save for those that Germany had to deliver to the Entente Powers as an earnest of good faith. Meanwhile questions of internationalization have been discussed and an informal draft of a platform for a new body of international law has been read to the Peace Congress in Paris. Now the great question of a treaty of peace will come forward for discussion, and it is to be hoped that some progress in that direction soon may be assured. The future of business is deeply concerned with the extent and character of competition and demand that will follow the determination of future trade relations. These will come through the ratification of a peace treaty, putting an end to the War and giving a firmer basis for commercial and political reconstruction.

FOREIGN trade is assuming increased importance in American industry. The National Foreign Trade Council, which will hold its sixth convention in Chicago beginning April 24, is an expression of the conviction among business men throughout the country that a struggle for markets abroad is essential to our national welfare. The drift of population to manufacturing centres has been intensified during the War. This means that a surplus of labor is available for manufacturing, and that the domestic demand cannot absorb the output of the workers. That is the situation, reduced to its simplest terms. Business at home is tending toward a normal volume because the stocks of general commodities are low. It is the surplus production for which a market must be found. The National Foreign Trade Convention will discuss this problem, and seek a practical solution. The chairman, Mr. James A. Farrell, who is president of the United States Steel Corporation, will bring to the debate the ripened thought of a man in a position to judge the needs of big business, and to estimate at their true value the opportunities for expansion into foreign fields. Every manufacturer of mining machinery is concerned in these efforts, and should contribute to the deliberations.

AMONG the papers read before the recent meeting of the Californian chapter of the American Mining Congress was one, by Mr. David M. Folsom, on the oil industry. We take pleasure in publishing it, because the writer is particularly well qualified on the subject, having been Professor of Mining in Stanford University and Oil Director for the Pacific Coast for the Fuel Administration before he became assistant to the president of the General Petroleum Company of California. Mr. Folsom makes clear the important part played by oil in our industrial system, for the economic welfare of the Pacific Coast is dependent upon an ample supply of cheap fuel-oil. He deplores the disadvantages to which the development of oil-lands is subjected and arraigns the administrative policy under which such development has been blocked during recent years. Since he spoke the Minerals Leasing Bill has been pushed nearly to enactment and it is hoped that many of the anomalies and handicaps crippling work on the oilfields of California will be removed. His objection to Government ownership was heartily applauded. Undoubtedly the mining community is extremely anxious to be relieved from the attentions of the halo-hatted gentlemen at Washington. The spirit of the pioneers is not dead; the sons of the frontiersmen resent the impact of paternalism. They want to be let alone to proceed on their own initiative, under the law, as their fathers did, and they are heartily tired of the policy of repression that hinders the legitimate play of that individualism to which the West owes its economic existence.

MR. JULIUS KAHN, who will be chairman of the Military Affairs Committee of the House in the Sixty-sixth Congress, has announced his firm belief in the need of universal military training. It is impossible, when writing on Washington's birthday, not to recall that we owe to our first President the slogan "In time of peace prepare for War." America has learned anew the value of that advice, and it is encouraging to know that eminent leaders in Congress are disposed to follow it. The disturbed conditions in American life today, the hardships of industrial re-adjustment, the taxes that will oppress the people for years to come, are partly the result of failure to adhere to the doctrines pronounced by George Washington in his great address of political warning. Had we been ready to defend our rights, and determined to preserve world peace by forceful persuasion if necessary, had we shown it in our dealings with irresponsible revolutionaries in Mexico and elsewhere, it is almost certain that the German madness would have been restrained by considerations of prudence. Even in designing the league for peace it was recognized in the course of debate that this country must maintain a military establishment larger than we had ever seriously considered in the days before the War, all which indicates that we do well to apply the old lessons for the maintenance of happy international relations, uncontaminated by peace, and undisfigured by war.

PRODUCERS of silver will be interested in the Annual Bullion Letter of Samuel Montagu & Co. of London. The concluding paragraph should please our friends in Colorado, Idaho, Montana, Nevada, and Utah. It says: "Although the output [of the world] may be accelerated, the needs of India and China, the obligation of the United States government to re-purchase, and the cumulated demand for the trade will ensure a high level of prices for some time." We note that Mr. Edward Brush, vice-president of the American Smelting & Refining Company, which recovers more than 60,000,000 ounces of silver annually at its refineries, recently took a favorable view of the future of silver, although he considered it doubtful if England would continue to purchase "dollar coins" for any great time. Neither did he think it probable that the United States Mint would complete the purchase of 200,000,000 ounces of silver for many years to come. Mr. Brush estimates an annual shortage of silver amounting to 170,000,000 ounces. These factors point to the continuance of high prices for that metal. On the other hand, Mr. J. K. Lynch, governor of the Federal Reserve Bank at San Francisco, recently stated as his opinion that when all embargoes on gold are removed there would be a drop in price. At present most of the silver for the Orient is shipped across the Pacific. This is the result of war. Now that the danger of losing shipments is past, and that England's control of India is confirmed, the metal may resume its movement to London and thence to the Far East. Four times since September last the price was reduced there, the latest being last week, when it was lowered to 47¾ pence, equal to 95 cents. However, the immediate future for producers of silver appears to be bright. This view is substantiated by the fact that the output of silver in the United States during 1918 was 68,000,000 ounces, notwithstanding the stimulus afforded by an increased price and the extraordinary output of by-product silver, caused by the abnormal production of copper and lead. About 70% of the total silver marketed in the United States has been derived from the refining of these two metals. The politico-economic emergency in India, which prompted the call from England that resulted in special legislation in this country to release large quantities of silver for export, has passed, but there remain large balances in favor of the Orient to be settled.

Exporting the Alien Firebrands

Bolshevik agitators by the carload are being shipped to the Atlantic seaboard for re-export. We have no equipment in this country for utilizing such raw material, and it displayed poor business judgment on the part of the Russians to ship it here. The American laboring man is not a cut-throat and a firebrand; he is an industrial worker, a gentleman in a good old uncorrupted sense of that word, the father of children who still, as in the days of Jefferson, Madison, Jackson, and Buchanan, become trained in the duties of honorable citizenship, with the thought encouraged in their minds that before them leads, as the reward of industry and culture, the ascending highway through local offices to the opportunity of serving their country in the highest positions within the gift of the people. It was in no jesting spirit that the poorest little ragamuffins were told that they might aspire to the presidency. They believed it; they aimed at it; and they achieved it. It was an inspiration, in the month of February, when we celebrated the man who made and that other who saved the United States of America, to contrast the alien doctrine howled at our laboring men from the harsh throats of the crazed fiends of anarchy, with those uplifting principles upon which this country has been nourished and which endure vitally today in the hearts of all who are in deed and in truth Americans. Every citizen feels the dignity of partnership in a nation that enabled a Millard Fillmore, the 'bound-boy', to buy his freedom to enter a lawyer's office from which he should rise to the seat of the Chief Executive, or that recognized a master in Andrew Jackson after he had, by his own native intelligence, pulled himself out of the obscurity of Waxhaw, or that discerned the power in that self-made giant, Abraham Lincoln, who labored with axe and plough without counting the hours, and then studied by the light of the fat-pine on the hearth in preparation for a work that proved to be the rescue of these United States from rupture and disaster.

Of such men is the galaxy of American heroes constituted; of laboring men, of workers, who cultivated and strengthened both hand and brain that they might devote them to the service and protection of their countrymen. That has ever been the way of the true American. He is constructive, not destructive; he is a citizen, not a pillaging carpet-bagger; he accepts civic responsibility and is found always with the forces that sustain law and order. The times have not changed, save in the imagination of some who are confused with the disorders of a world that has suffered restrictions, in political privilege and material resources, such as we cannot experience in America if we hold to the birthright God has given us. It is a corrupted view, an alien conception, that opportunity here has narrowed, and that simple ability cannot win, as in the days when every man regarded his daily wage merely as the stepping-stone to a business of his own. We have but to look at our captains of industry to find refutation. Were they not workers, laborers with their own hands? Was not Mr. Charles M. Schwab reared as a humble boy serving in a Pennsylvanian livery stable? Did he not select as his chief of staff Mr. E. G. Grace, who had to work his way through Lehigh University? Did not Mr. F. A. Vanderlip earn his bread in the sweat of his brow before he became the great figure that he is, a leader in the broadening of America's banking and financial relations to cover the whole wide world?

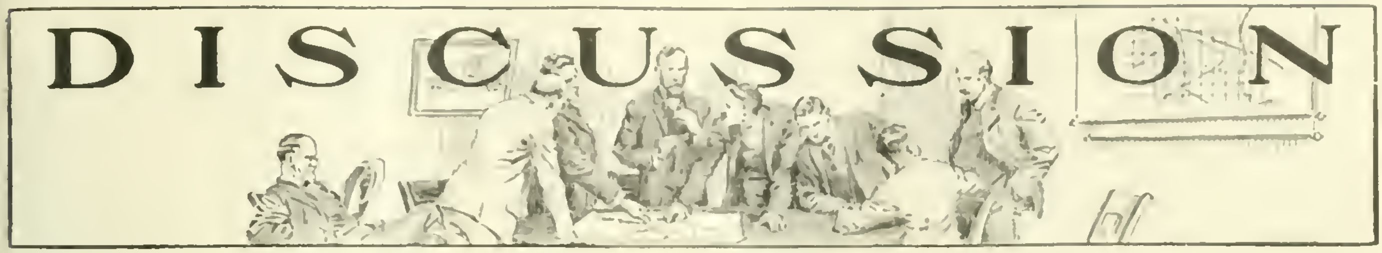
The wholesome days of the individualists, who believed in their own personal capability to rise, and who held fast to their Government as the safeguard of their sacred rights to political protection, are not ended. They have been clouded at times by dark teachings brought to us from abroad, but bright ideals have come also with crowds of immigrants who recognized the possibilities of free America for the uplift of men. America has been generous in admitting the hordes of Europe; they were welcomed as home-seekers, and lavishly the lands of a continent were given to them, but when they come as destroyers of home and industry they must be treated as the firebrand has ever been. The instigators of riot in Seattle prove to have been professional foreign agitators; the outlaws at Butte were mostly aliens of a type that should have been barred at Ellis Island and never permitted to contaminate a democracy by their presence. The peaceful miners at Jerome, though complaining because of reduced pay, were prevented from going to work by the mob of alien I. W. W. miscreants, who made it impossible for the mines safely to continue in operation. It is evident that the time has come to safeguard America by drastic restriction of immigration. There is no fear of those who have received benefit from the liberal opportunities accorded them to make money in America; the peril of the hour is in revolution taught by the Russian tools of the German 'imperial republic', encouraged for the purpose of crippling American industry so as to make easier the new commercial war that the Germans are preparing. Bolshevism is now the weapon with which the Teuton seeks to crush those whom he failed to conquer on the battlefield. Let no one for a single moment confound the propaganda of the Bolshevist I. W. W. with the honest purposes of the American laboring man.

An International Gold Reserve

Proposals, offered tentatively by the Federal Reserve Board, for the establishment of an international gold fund, to be used for balancing the credits and debits between the nations without the actual exchange of bullion, is another of the interesting idealistic suggestions that give so peculiar a flavor to the politics of the period. The first reason for creating such an international gold reserve is that losses are thereby obviated; not alone the losses that take place in minting, melting, and handling, but those arising from the cost of transportation also. On similar grounds the rationality of creating national gold reserves as a basis for currency issues has resulted finally in driving gold coin out of general circulation. To extend the idea to international exchange is, therefore, but to take the next logical step. That was foreseen many years ago. It is a familiar conception, but hitherto regarded as only another of the brilliant Utopian dreams that no one expected would take form and substance in a world of hard reality. It had been discussed as a fanciful trust for a new order of St. John, laboring for the safety of the world in what concerned its vital commercial needs, that is, its need to be fed and clothed, as the Knights of Malta defended the citadel of Valetta from which the Christian world once made good its commands of peaceful intercourse on the Mediterranean. An international gold reserve would require a body of custodians, trusted, authorized, sustained, by the common need and faith of all nations, in short, a new method of finance. How might their sacred responsibility be assured? Where should be the monetary Valetta, and what nation or group of nations should supply the defensive equipment competent to exert an effective offensive against a would-be aggressor? Will England consent that we hold the treasure of the world, or that France guard it, or will we surrender our own expectations of becoming, in this newer fashion, the world's banker? We initiated something suggestive of this custodianship during the War, when we held gold deposits for the credit of the Argentine against which she issued currency at home; but will the world accept our guardianship of the universal stock of gold? It is not in levity that we ask these questions, but the mere asking of them turns the proposal into a jest. Sober sense teaches that, if gold have any use as a basis for exchange, and thereby have any command over the resources and products of the world, the jealousies of self-determined separate nations will not agree upon any custodian possessed of actual power in commerce and in population. If they should agree upon a lesser nation, a petty internationalized Malta, then the centre of imminent international political vulcanism would surely be found at that spot. In practice it might prove possible to accomplish nearly the same thing on the principle of our own distributed gold reserve, where bullion in San Francisco, under control of the Federal Reserve Bank, may be considered for financial purposes as being in New York, merely by crediting it to the account of that branch. Similarly, gold in Ottawa has been treated by the British government as if on deposit in the Bank of England. This would be one way of solving the question of custody, but it would not alter the relations of gold to the currency employed by the man in the street. The conception involves one more step in financial evolution. Just as soon as an international treasury for an international gold reserve should become established, gold would cease to be the real basis of exchange. Its present function would of necessity automatically cease. Adjustments then would be in terms of the so-called market-gauge dollar, for if an agreement for an internationalized gold-reserve could be reached between the nations, the qualities of density, indestructibility, and the rest, that so long have marked gold as the acceptable medium of exchange, would cease to be important. It would instantly appear that the settlement of balances was actually being effected on the basis of the ratios subsisting in commerce from day to day or from week to week between the volumes of production and consumption of essential commodities. The Federal Reserve officials, East and West, are developing a new cult; they tell us that gold more and more is being pushed into the background. Such indeed is the tendency of the moment, and it should not be obscured that this is a fact. It concerns deeply the business man, the investor of savings, and all those who still entertain sufficient doubt concerning the eternal wisdom of law-makers and law-making at this stage of the world's progress as to insist upon writing into bonds and contracts the time-honored phrase, "payable in gold." It is of vital moment likewise to the gold miner, for he has been counting upon the need of that metal as a basis for currency-expansion by the treasuries of this or other countries. The Government was his market, but the logical outcome of the new financial policy proposed would be to dispense with gold as a basis for credit-money. The single consideration that serves to convert gold in the Treasury into a basis on which paper money may be put into circulation is the fact that the paper is a warrant with which the holder may draw out its nominal equivalent in the metallic money with the ring to it that has made seductive music down the ages. Except for that, currency would stand on a political basis, and the value of the certificates of service, or whatsoever they might be called, would depend on acts of Congress, national or international. With gold held as a trust in a world treasury, it would be practically as if it had disappeared from the face of the earth, and then the miner's market would be the public, at advanced rates, for hoarding, unless the governments should commandeer the output.

Idealism often presents the defect of perfection that destroys adaptability to the unbalanced and indeterminate conditions of mundane affairs. As long as human nature remains inferior to the lofty plans that the human brain can evolve, and until the schemes for a society of nations gain the assurance of survival through long-continued practical test, the attempt to concentrate the world's gold in the vaults of an international custodian will be fruitless. To undertake it would mean the frank acceptance of credit-money as the sole medium for commercial transactions. Until confidence in such credits should become established by decades of proof that society was firmly planted on the new foundation, this inevitably would check the expansion of those forms of enterprise that are characteristic of modern civilization. It would once again divert men from the mechanic arts to the ancient solid basis for existence that is found in agriculture, but a new set of industrial conditions also would follow, tending, for good or ill, to bring back the land baron as a dominant factor in human society. Despite the fanciful notion of a gold-reserve league to match a league of nations, the world will long cling to the feeling of safety that the individuals in it cherish when their currency reads as a promise to pay on demand in the yellow coin of the realm.

DISCUSSION



In Behalf of the Prospector

The Editor:

Sir—Your paper, with other mining journals, has given much space to discussions about prospecting and of the causes leading to its decline. Nearly all the articles have regretted the passing of the prospector, and not a few have touched upon one or more valid reasons for his disappearance as a class. But it seems to me that no mention has been made of one of the most vital points of the subject, which, to put it briefly, is that the prospector's domain is being taken away from him by such adverse legislation as the 640-acre stock-raising homestead law. In other words, no new mining discoveries are being made for the all-sufficient reason that the territory wherein they might be made is rapidly being patented to stockmen and put under fence. And you know, and I know, and every man raised in the West who has had any dealings with prospectors knows, that they will not go inside a fence to prospect.

This is a fact of human nature Congress did not take into consideration when it framed that law. It presumed that it was amply protecting the miner when it reserved the minerals to the Government. Such reservation is valueless from a practical standpoint. Why? Because the Government is not going to mine the reserved minerals and no one else will. The result is that thousands of acres of prospectively valuable mineral land is being patented to some cattle or sheep man—as to surface at least; and that means all of it from a practical standpoint.

To illustrate: Jones is an American-born miner. He has a high-school education and is observant, intelligent, and studious. He has worked in the Bisbee mines for several years and has supplemented his work by considerable study of geology, mineralogy, and the theory of ore deposition. He takes a prospecting trip north of Bisbee in the vicinity of Gleeson. He notes that the limestones are of relatively the same age as those at Bisbee, and that the known orebodies are closely allied to the granite-porphyry intrusions as at Bisbee. He locates three claims, upon each of which is some showing of copper carbonates. For several years he does his annual work as required by law, realizing that he must have more capital ere he can undertake to explore his outcrop for any depth.

Meanwhile, the 640-acre homestead law is passed with its reservation of the minerals of the entered land to the Government. The Bar Z Cattle Co., by reason of settlement of the Sulphur Spring valley below Gleeson, finds itself crowded for range. Wherefore, several of its cowpunchers enter 640-acre homesteads, one of which includes and covers Jones's unpatented mining claims.

Under our system of land laws the U. S. Land Office has no record of unpatented mining claims. The land they cover is, so far as the Land Office records are concerned, public land until such claims have been surveyed for patent and patent application duly filed (I am speaking here of lode-claims). Consequently, when the Bar Z's cowpunchers file their 640-acre homesteads over Jones's three lode-claims the Land Office allows such filing simply because it knows nothing of Jones's prior title to a portion of the land.

Jones has held these three claims for several years. He has expended thereon $100 per claim per year, which money went to the community. He has not sought to patent them, because, being a wage-earner, he hasn't had the money—for it costs about $1000 to patent a lode-claim nowadays. But he has felt secure in his title under the mining laws, having a valid discovery of "mineral in place" and having each year done and recorded his statutory work. But now he sees his claims inside a cattle-fence. And when he consults the law (Act of December 29, 1916) he is confronted with the astonishing fact that he, with his prior and better title, must actually give a bond to the homesteader if he wishes to work his claims. Knowing the Bar Z outfit, and being an intelligent man, he realizes that insofar as realizing anything from his claims he might as well 'forget it'. If he sought to enjoin them, or if he protested to the Land Office and ask for a hearing, they will swear him out of court by a preponderance of witnesses—most of whom will be other cowpunchers and know nothing whatever about geology or minerals. Soon a fence is around the claims, Jones gives up in disgust, and thus are some promising claims taken from the domain of the prospector.

The above illustration is founded on facts. True, the names are fictitious but the places and facts are not. And not alone in Arizona, where most of the orebodies are deep-seated, is this very thing happening, but likewise all over the West.

It seems to me that mining men as a body should take cognizance of this situation. If they inquire closely into the law they will see that they have much on their side, although it has not been presented or threshed out. Section 2322, Revised Statutes, says, in express words, that mining locators "shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations * * *"

Now the stock-raising homestead law, the Act of December 29, 1916, states that such homestead shall be filed only upon "unappropriated, unreserved public lands."

Land has ceased to be "unappropriated" or "unreserved" when there has been a valid mining location made on that land. If the locator has a discovery of "mineral in place" he has a title second to none that can be initiated under our public-land laws, as, I think, our courts have pretty well decided. Hence, any homestead filed over mining locations made and held in good faith, even though those locations have not been surveyed for patent, is not made in accordance with the spirit or intent of the law.

But the ugly fact remains that it is being done every day, just as I have herein illustrated. Wherefore, as I said at the first, prospectors as a class are disappearing simply because their domain has disappeared; taken from them largely by legislation like this 640-acre law, which, the records show, was fathered, fostered, and lobbied through by the cattle interests. And yet in all the West the prospector has preceded the farmer and stockman, and has generally made possible their coming.

Strange, is it not, that such legislation should be passed at the very time when the War boards, papers, mining journals, Bureau of Mines, etc., were making appeals in the public print to develop our mineral resources! And the old prospector who has done so much for the progress and comfort of the American nation through his patient search and uncovering of mineral deposits cannot but feel that Congress says to him, by the 640-acre law:

"Yes, you are a good fellow all right. But for you we would not have been able to make the wonderful industrial progress we have, simply because man cannot multiply his power through his use of agricultural products as with the metals and coal and the minerals to harden and temper his tools. You have braved the terrors of the desert heat and thirst, conquered its difficulties, scaled its mountains, bridged its barrenness, and, in the end, wrested from it its age-long secrets and its hidden hoards. But your day of usefulness is over, and in place of affording you a chance to develop a second Bisbee we are going to turn your claims over to the stockman that their scanty browsing may furnish subsistence to a few more head of scrawny Mexican cattle."

It's not that bad you say? Try it once; or try to hold a mining claim within the thousands of acres in our national forests!

Again I say that all prospecting needs is the land to prospect!

J. E. Bush.

Phoenix, Arizona, January 31.

[This is a matter that deserves the urgent attention of the American Mining Congress.—Editor.]

The Status of Gold

The Editor:

Sir—I read the article in the 'Mining and Scientific Press' on the 'Status of Gold', by E. S. Van Dyck and had the same re-published in the Deadwood 'Pioneer Times'. In the discussion of the article various ideas were expressed, and one point particularly has been challenged. The author states that the world has been quite thoroughly prospected, and that the outlook for the discovery of new goldfields of importance is not particularly encouraging. In case his plan should be considered as feasible and the intrinsic value of gold doubled, there would be vast deposits of $2 to $3 gold ore containing probably a half to one ounce of silver, which could be prospected and developed. There are here in the Black Hills such deposits, both in the shales and quartzites as well as in the schists, lying idle at the present time. Innumerable veins were disclosed in crosscuts and not followed for the reason that the contents were not sufficiently large to warrant further exploration. Whether the veins might have developed into deposits of ore that could be handled economically under present conditions has never been determined. It stands to reason that deposits of the grade mentioned above, if Mr. Van Dyck's plan were accepted, will be developed, and under those conditions new goldfields of importance will more than likely be discovered.

A. T. Roos.

Deadwood, S. D., February 10.

Costs of Mine Supplies

The Editor:

Sir—The following table, showing the relative cost of the ten chief commodities entering into our [the Mogollon Mines Co.] operations, will be of interest, and may bring out comparative data of value from other operators.

Unit, f. o. b.	July 1, 1914	January 1, 1919	Increase, %
Powder, cwt., Silver City	$12.50	25.50	104.0
Fuse, case, Silver City	21.00	43.69	108.0
Caps, M, Denver	6.79	18.20	168.0
Drill steel, cwt., Silver City	7.25	14.55	100.1
Battery steel, cwt., El Paso	4.70	10.50	123.4
Cyanide, cwt., New York	20.70	30.00	44.9
Lead acetate, cwt., Mogollon	10.20	19.615	92.3
Sheet zinc, cwt., La Salle, Ill	6.44	13.00	101.9
Belting, ft., El Paso	0.095	0.194	104.2
Fuel oil, bbl., Silver City	1.55	3.45	122.6

The prices, as of January 1, 1919, represent practically the peak of the cost of supplies. There have already been some decreases, notably in the price of powder. Taking the normal prices as given on July 1, 1914, it will be noted that the average advance has been 106.9%. On January 1, 1918, the advance in the cost of the same supplies averaged 96.5%, and on January 1, 1917, 56.74%. It is interesting to observe that the smallest advance was that in the price of cyanide, namely, 44.9%. This commodity, of course, is all furnished by the Roessler & Hasslacher Company.

S. J. Kidder.

Mogollon, New Mexico, February 8.

Latin American commerce has been growing enormously, with the balance of trade strongly in its favor. The imports to the United States from Latin America in 1918 were valued at $1,046,943,000, and our exports in return amounted to $668,240,000. Money is easy in the southern countries at present, and extensive developments of mining enterprises, irrigation schemes, and further hydro-electric plants are said to be in contemplation.

Leaching of Lead From Carbonate Ores

By DORSEY A. LYON and OLIVER C. RALSTON

*At the time the experimental work on lead carbonate ores was initiated little was known of the solubility of lead chloride or of lead sulphate in strong brines, and hence the first work done was to endeavor to convert the lead of the ore into lead chloride, which is known to be soluble in hot water.

The solubility of lead chloride, as given by Landolt and Börnstein,[1] is shown in Table 1. A curve plotted from the figures given in Table 1 is shown in Fig. 1.

If a cheap method of conversion of lead carbonate into lead chloride can be found, as well as a cheap source of heat for heating water, the number of tons of solution necessary per ton of ore to leach out the lead from most of the ores tabulated would not be large.

PRELIMINARY TESTS. With this possibility in view, some of the ores were treated with dilute solutions of hydrochloric acid, followed by washing with hot water. Only small quantities of ore were treated in these tests, 35 grammes being the usual amount. It was found that the lead could be extracted in this way. The next step was to use brine to which sulphuric acid had been added in order to generate hydrochloric acid, although it was felt that this would be a failure, as the sodium sulphate resulting from the reaction of sulphuric acid on sodium chloride should precipitate lead sulphate, if no soluble double salts are formed. However, the brines leached out the lead in spite of their containing sulphates in solution. As the final leaching solution to be adopted was a saturated solution of sodium chloride, the results of these tests are briefly summarized in Table 2 following.

The ore treated was from the May Day mine of the Tintic district, Utah, and contained about 5% lead, and some silver.

In the first series of tests shown in this table two variables are involved—the concentration of the acid used, and the amount of acid relative to the weight of ore. The time of contact with the material was of sufficient length to obliterate any effect of the acid concentration. Thus the results of this series of tests show the effect of the relative amount of acid on the extraction of the lead and on the acid efficiency. By acid efficiency is meant the amount of acid theoretically needed to convert all of the lead to chloride, compared to the amount of acid actually consumed. In other words, if one equivalent of lead is extracted by an expenditure of acid equivalent to twice that amount of lead, the acid efficiency is 50%. The acid efficiency was calculated in each test by observing the number of grammes of lead extracted, and also the number of grammes of acid used up by the ore. One gramme of lead theoretically requires 0.3125 gm. HCl to convert it to chloride. If twice that amount of acid was consumed by the ore for every gramme of lead extracted, the acid efficiency was (0.3125 : 0.6150) × 100 = 50%.

Per cent Pb in solution.	Per cent $PbCl_2$ in solution.	Temperature, °C.	Per cent Pb in solution.	Per cent $PbCl_2$ in solution.	Temperature, °C.
0.475	0.637	0.0	1.156	1.550	45.00
.518	.695	8.0	1.550	2.080	65.00
.716	.961	19.95	1.892	2.540	80.00
.767	1.030	25.00	2.382	3.200	100.00

TABLE 1

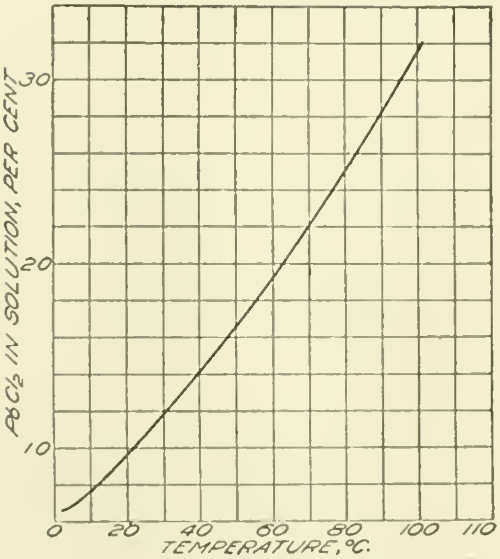


FIG. 1

The first series of tests (series A) showed that hardly enough acid had been used. Series B was run with slightly more acid, and the time of contact of the acid with the ore was varied from 1 hour to 48 hours. The results of this series of tests shows that a fairly good extraction can be obtained in a few hours, but that the acid efficiency increases slowly. This latter result is difficult to interpret, as it seems to indicate that after 48 hours more acid is left in the solution than after 24 hours from identical charges. Regeneration of acid is not probable. There is no method of determining accurately the acid content of a solution containing metals such as iron and lead, and it is probable that in the longer tests more of the material that affected the end point in

[1] Landolt, H. H., Landolt-Börnstein, physikalische-chemische Tabellen, 1905, 3rd ed., p. 564.

titrating the acid had gone into solution. As much more important and more nearly commercial results were obtained shortly afterward with the use of brine for leaching, this point was not investigated further.

In the third series of tests, series C, the same weight of acid relative to the weight of ore was used, but was diluted with different amounts of water and the concentration of the acid varied accordingly. Seemingly the more dilute acid converted a greater proportion of the lead to chloride and with a greater efficiency of acid.

The discovery that the brine solutions used in one or more tests were more efficient solvents of lead chloride was coincident with several other lines of evidence learned of at about the same time. The mills of the Holt-Dern Co. at Park City, the Knight-Christensen Co. at Silver City, and of the Bunker Hill & Sullivan Co. at Kellogg, Idaho, were visited. In each of them the use of brine solutions for other purposes had revealed the fact that the lead chloride formed in the particular processes used was soluble in brine solutions to a greater extent than in water. At the Bunker Hill plant it had been found that the sulphate of lead was likewise soluble in brine. About the same time Demassieux[2] published the results of measurements of the solubility of lead chloride in solutions of salt. His results are given in the curves of Fig. 2.

Sample No.	Time of leaching.	Volume of solution used.	Concentrated acid used.	Acid efficiency.	Lead extraction.

C 2	24	150	2.39	41.4	69.7
C 3	24	200	1.79	51.0	70.3

TABLE 2

The curves show that the solubility of lead chloride in water is at first decreased by small additions of sodium chloride, owing to the well-known 'common ion" effect, but that after about 5% of sodium chloride has been added, the solubility of the lead chloride begins to increase within the range of temperatures shown (0° to 100° C.), to the point of saturation of the solution with both $PbCl_2$ and NaCl, and finally falls to zero again with a solution saturated with NaCl. The increase in solubility in such solutions is usually ascribed to the formation of a double salt of the two substances involved. No attempt was made to determine the formula of this double salt, as the increased solubility is the important fact in these experiments, the character of the compound formed being chiefly of scientific interest.

The curves in Fig. 2 show that at any temperature between 0° and 100° C., the solubility of the lead chloride is greatest in the solutions that are more concentrated in sodium chloride. Consequently all brines used as leaching solutions in further experiments were made nearly saturated.

USE OF ACIDIFIED BRINE. To verify the fact that lead chloride was soluble in saturated brine, three different carbonate-of-lead ores were treated with brine to which had been added either sulphuric or hydrochloric acid. Five tests of each ore were made. In the first three tests of each ore increasing amounts of sulphuric acid were added to the brine; the other two tests were with hydrochloric acid. Sulphuric acid reacts with the brine to form hydrochloric acid and sodium sulphate, and it was thought that the sodium sulphate would decrease the solubility of the lead chloride by tending to precipitate insoluble lead sulphate. It was found that sodium sulphate has no such effect unless a considerable proportion is present, and later tests of the solubility of lead sulphate in brines showed that as a rule the addition of sodium sulphate in proportions ranging up to about 2% of the weight of the solution tended to increase the solubility of the lead sulphate. This is a curious chemical anomaly.

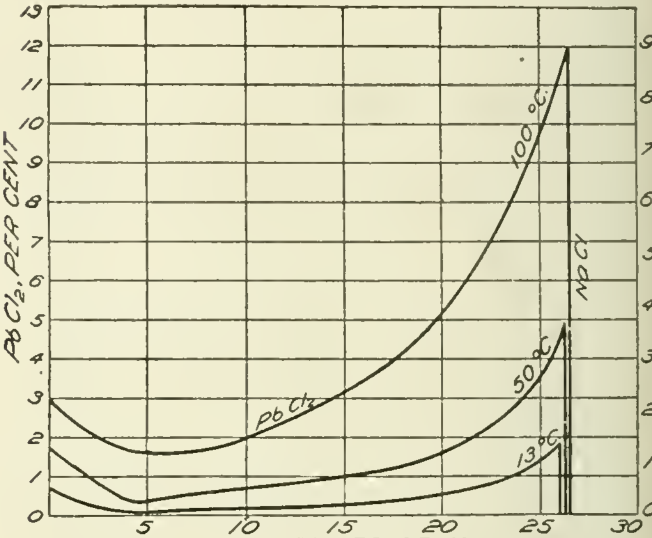

FIG. 2

As all of the ores tested contained more or less silver, and some of it was known to be present as chloride, the leaches were tested for that metal. The results showed that some silver was being leached.

In each charge 100 gm. of 10-mesh ore and 1000 cc. of saturated brine (1210 gm.), into which the acid was measured, were used. The charges were agitated in 2.5-litre acid bottles for 24 hours. In the first three tests with each ore the theoretical, three times the theoretical, and five times the theoretical amount of sulphuric acid, respectively, needed to convert the lead carbonate to sulphate were used. In the fourth and the fifth tests the theoretical and five times the theoretical amount of hydrochloric acid needed, respectively, to convert the lead carbonate to lead chloride were used.

---

[2] Demassieux, N., Equilibrium between lead chloride and sodium chloride in aqueous solutions; Chem. Abs., vol. 8, 1914, p. 1899.

The results are shown in Table 3. Excellent extraction of the lead is possible if sufficient acid is applied, but only part of the silver is extracted. The efficiency of the acid is lowest with the ores that contain the largest amount of soluble gangue materials, such as lime, alumina, and iron. The best acid efficiency obtained with the Chief Consolidated ore was 24.6%, that is, of all the acid consumed only 24.6% did useful work in leaching lead, the rest of the acid being wasted on gangue materials.

As regards the action of hydrochloric acid and that of sulphuric acid, there did not seem to be any great difference except in a few instances. Thus tests No. 1 and 4 on the ore from the May Day mine apparently showed that a high extraction of lead was possible with one equivalent of hydrochloric acid, whereas one equivalent of sulphuric acid gave only a low extraction. With five equivalents of acid present the action seemed to be the same. Considerable care was taken in making up the samples, but it is possible that some error crept into one of these determinations, as there is no such marked discrepancy in the other results. Former experiments by Ralston and Gartside[3] had shown definitely that there was no difference in the action of the two acids in the leaching of zinc from oxidized ores. Most of the data in Table 3 tend to show the same result for the lead carbonate ores, although there seems to be some minor differences, probably due to errors in the analytical work.

Second Series of Tests. As these tests showed that it was possible to leach most of the lead from all three ores tested, and with encouraging consumptions of acid for two of them, a number of other ores from different localities were tested to determine whether they would respond in like manner. The results are shown in Table 4.

In each test a pulp consisting of 1000 cc. of brine to 100 gm. of ore was prepared. The leaches were agitated all night and on the next day were filtered for analysis. The temperature at which these experiments were run was that of the laboratory, about 20° C. The extractions of lead from the Daly Judge carbonate ore were not as high as was expected. Later tests showed that it was difficult to get more than 1% of lead into solution in a brine at the laboratory temperatures, hence the use of 10 volumes of solution to 1 weight of ore was slightly below the requirements for the proportion of lead in this ore. Only one type of ore, Iron Blossom No. 10, gave discouragingly low extractions. This ore was really a silver ore containing a small amount of lead. In all of the materials tested the silver content was disregarded for the time being, as the object was to study the lead in as many different ores as possible. As regards acid efficiency, the ore from the Scranton mine and the tailings from the Wilbert and the Horn Silver dumps seemed to use less acid per unit of lead extracted than the other samples, and further tests were therefore made with these materials.

The amount of acid used in each test is expressed as an equivalent to the lead. That is, one pound of lead is equivalent to 0.474 lb. of sulphuric acid (anhydrous), or, roughly, one-half pound, so that in general one pound of sulphuric acid should convert two pounds of lead to a soluble form, provided some of the acid is not used up by other constituents of the ore. The data in Table 4 were used in preparing the curves in Fig. 3, except that the results have been converted to the number of pounds of acid that gave an extraction of a definite number of pounds of lead from a ton of ore. This is the information that is needed in any calculations as to the financial possibilities of such a process.

[3] Ralston, O. C., and Gartside, A. E., Leaching a zinc-lime ore with acids; Met. & Chem. Eng., vol. 13, 1915, pp. 151-155.

From these curves it is evident that with some of the ores the amount of lead extracted after adding more than two equivalents of acid is actually smaller than with less acid. The result is probably due to the excess of sulphate radical present that tends to re-precipitate lead sulphate from the solution. The materials that acted in this way are the ones that did not contain noteworthy amounts of acid-consuming constituents, and hence gave high acid efficiencies. Down to the limit of the amount of acid necessary to convert the lead carbonate to a soluble form it is best not to use any more acid than such material seems to require. With some of the other materials the addition of more acid always resulted in the extraction of a little more lead.

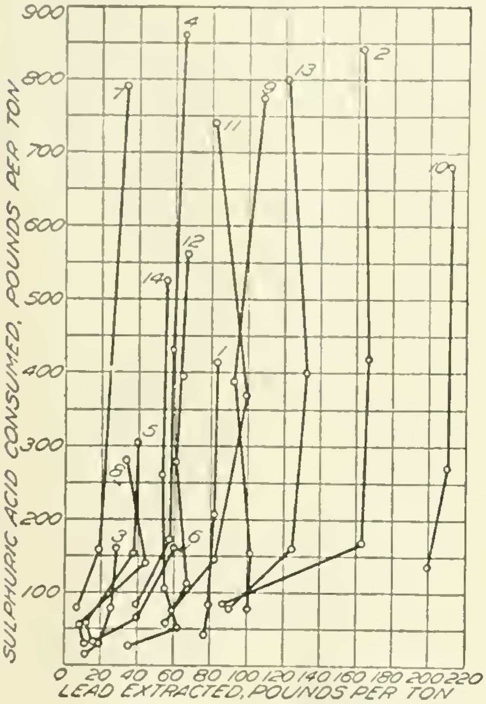

FIGURE 4.—Curves showing relation of lead extraction to consumption of acid in second series of leaching tests with acidified brine. *1*, tailing from Ontario dump; *2*, tailing from Bullionville dump; slimes from Eureka Hill dump; *4* to *7*, Michigan-Utah ores; *8*, Chief Consolidated ore; *9*, slimes from Copper Queen dump; *10*, Shattuck ore; *11*, tailing from Dry Valley dump; *12*, tailing from Daly West dump; *13*, slimes from Bullion Beck dump; *14*, Nevada United ore.

THIRD SERIES OF TESTS. Another set of argentiferous lead carbonate ores was treated in the same way. The data on the lead extraction from these ores have been calculated and plotted in Fig. 4, to make the results comparable with those in Fig. 3. Although the various ores tested vary widely in lead content, it is a strange coincidence that in only a few ores will the use of more than 150 lb. of sulphuric acid per ton of ore give a higher extraction of lead than is obtainable with that amount of acid. In those experiments, however, the main consideration governing the amount of acid used was the possible extraction of the silver in the ore. Therefore the data on the lead extractions are only of technical interest.

TESTS OF TAILING. Two of the samples that seemed to give the best acid efficiencies were the Wilbert tailing and the Scranton ore. These were chosen for further experimentation. It was necessary to know the minimum time required to extract the lead and the minimum amount of brine that would hold it in solution. It also seemed possible that the application of stronger acid solutions would dissolve the lead faster than weaker acid solutions containing the same weight of acid in a greater volume of brine. All of these points were tested on a sample of the Wilbert tailing. The charges consisted of 100 gm. of ore, usually with 1000 cc. of saturated brine unless otherwise stated. The material was placed in ordinary 2.5-litre acid-bottles, which were placed on their sides on a cyanide agitator and rolled over about once every two seconds. After agitation, the contents were filtered on suction-filters consisting of a pump, flask, and a Büchner porcelain funnel.

[a] 1 equivalent of H_2SO_4=0.474 pound per pound of lead.

TABLE 4

These data are presented in Table 5. Some of the results are plotted in Fig. 5. The curves showing the effect of time on the acid efficiency represent two series of tests, one of solutions containing two equivalents of acid, and one of solutions containing four equivalents of acid. The curve showing the percentage extraction of the lead represents the series of tests of solutions containing two equivalents of acid. The corresponding curve for the results with solutions containing four equivalents of acid would practically coincide with this curve, and was not plotted. The percentage of efficiency of the acid when four equivalents are used is considerably lower than when two equivalents are used, so both efficiency curves were plotted. The curves show that there is no advantage to be gained by prolonging a leach for more than two hours, either on the score of lead extraction or of acid efficiency. In fact, after two hours both the lead extraction and the acid efficiency fall off to some extent. One would expect that any excess of acid, on long standing, would gradually waste itself on other constituents of the ore, hence, the fall in efficiency of the acid is easy to understand. It may be that on long standing certain other constituents of the ore would also precipitate some lead, as lead is a metal that might be easily precipitated from solution by finely divided iron or particles of other minerals such as zinc oxide or zinc sulphide.

As these tests showed that two hours of leaching was sufficient, it was thought that a series of leaches of varying acidity might reveal the most advantageous concentration of acid to use. However, the percentage of extraction of lead and the acid efficiency seemed to be unaffected, or at least were not affected in two-hour leaches. The strength of the acid solution may possibly have some effect on the extraction or on the acid efficiency in leaches of less than two hours' time. This point was not investigated, as the results of the former series of tests, with two of the extremes of acid concentration used, showed that about two hours of contact between the solution and the ore was needed to get the most satisfactory extraction.

Table 5

The solubility curves for lead chloride in brines (Fig. 2) indicate that at ordinary room temperatures (about 20° C.), solutions containing as much as 1.5% lead when saturated with respect to lead can be obtained. Such a concentration could not be expected in practice, but it might be possible to get solutions containing considerably more than 1% of lead. Hence a series of tests was run to determine the minimum amount of brine, of a given strength, necessary to leach the lead from the Wilbert tailing, as in the previous tests leaches consisting of 1000 cc. of brine to 100 gm. of ore that contained only 5.5% of lead had been used. With complete extraction of the lead such a leaching solution would contain only 0.5% of lead.

Two series of tests with decreasing amounts of brine were tried—one with solutions containing 2 equivalents of acid and the other with solutions containing 1.5. The leaches containing less brine, therefore, had higher concentrations of acid, although the total amount of acid was either 2 or 1.5 equivalents in every test. As the results of the previous series of tests had shown little or no effect due to acid concentration, any effects shown by these two series were probably due to causes other than acid concentration. Leaches were successful down to the point where 400 cc. of brine to 100 gm. of tailing was used, when the lead extraction fell off slightly in the series containing 1.5 equivalents of acid. The acid efficiency was not affected. These solutions contained almost 1.2% lead. Therefore 1% lead was chosen as the probable maximum in practical work at temperatures of about 20° C., and many of the later experiments were so planned that there would always be 1 volume of cold brine for each 1% of lead in the ore. Thus the Wilbert tailing, containing 5.5% lead, could be leached with about 550 cc. of brine for every 100 gm. of ore. As the brine had a specific gravity of about 1.2 at room temperatures this rule will give, roughly, solutions containing somewhat less than 1% of lead. Hence a pulp ratio slightly less than that given by the rule will still have a large factor of safety. In counter-current decantation it would probably be safe to use pulp ratios that would give solutions more nearly saturated with lead.

Tests of Material From Scranton Mine. The results of a series of tests on the Scranton ore, similar to the series on the Wilbert tailing, are recorded in Table 6. Unlike the results with Wilbert tailing, as good an extraction of the lead was made in one half-hour as in 24 hours, and the efficiency of the acid was the same throughout the series. This indicates that practically all of the chemical reactions liable to take place had been completed during the first half-hour. As there are few types of modern agitating or leaching machinery that will receive and discharge the ore to be leached in less than a half-hour, no tests were made for a shorter length of time. The acid requirements of this ore are such that they must be used before the maximum extraction of lead is possible. The brine requirements of the ore are shown in the third series of tests to be about 700 cc. of brine to a solution containing more than 1.5 equivalents of acid every 100 gm. of ore. As the ore contains 8.65% lead, the leaching solutions could be built up to a strength of 1.03% lead under conditions that would give a maximum extraction of lead.

TABLE 6

Iron Ore in 1918

Statistics and estimates of the production of iron ore in 1918, compiled under the direction of Ernest F. Burchard, of the U. S. Geological Survey, show a moderate decrease in output compared with the high records of 1916 and 1917. The estimated quantity of iron ore mined in the United States in 1918 amounted to 69,712,000 tons, compared with 75,288,851 tons in 1917, a decrease of 7.4%. The estimated shipments of ore from the mines in 1918 were 72,192,000 tons, valued at $246,043,000, compared with 75,573,207 tons, valued at $238,260,444 in 1917, a decrease in quantity of 4.5% but an increase in value of 3.3%. The average selling-value of the ore per ton at the mines for the whole United States in 1918 was $3.41, compared with $3.15 in 1917. The stocks of iron ore at the mines apparently decreased from 10,628,908 tons in 1917 to 8,139,000 tons in 1918, or 23.4%.

About 86% of the iron ore mined and shipped in 1918 came from the Lake Superior district, in which 60,092,000 tons were mined and 62,285,000 tons were shipped in 1918, compared with 63,666,068 tons mined and 63,854,752 tons shipped in 1917, representing decreases of 5.6% and 2.5%, respectively, in 1918. The average selling price of iron ore at the mines in the Lake Superior district in 1918 was $3.50 per ton compared with $3.28 in 1917.

In the Western States—Colorado, New Mexico, Utah, and Wyoming—there were mined 750,000 tons, compared with 837,673 tons in 1917, a decrease of 10%. The shipments in 1918 amounted to 740,000 tons, compared with 832,056 tons in 1917, a decrease of 11%. The average selling-value of the ore in this group of States in 1918 was $1.72 per ton, compared with $1.39 in 1917.

BEARING-METAL should possess the following properties, according to G. H. Clamer: (1) It should be sufficiently rigid to support the load or resist the impact, but yet not so brittle that it will easily crack; (2) it should have as yielding or plastic a nature as is consistent with its ability to support the load or resist the impact without deformation of the bearing as a whole; (3) the ideal structure combines a hard matrix to support the load and a softer metal or alloy contained within such matrix, to permit the bearing surface to adjust itself to irregularities of the surface; (4) it should be easy to handle in the foundry and machine-shop; (5) it should be capable of being re-melted without deterioration; (6) for use in babbitt-lined bearings, it should be capable of being tinned, so that the babbitt can be applied thereto; (7) it should have good heat-conducting power in order to dissipate the heat generated by friction. Alloys have been made carrying as high as 30% lead with 3% tin and 2% antimony; also alloys of 65% copper, 30% lead, 2% tin, and 3% antimony; also with the 5% tin replaced entirely with antimony. Car-bearings, 4½ by 8 in., made from the same pattern and subjected to a breaking stress applied longitudinally at the middle of the back bearing and throughout its entire length, broke at the following average loads: with 2% antimony substituted, 60,000 lb.; with 3%, 62,000 lb.; with total substitution, 52,000 lb.; as compared with a breaking load of 67,000 lb. for the alloy of copper 65, tin 5, and lead 30. The castings produced with each of the three alloys mentioned are not so satisfactory as those made with the straight tin alloys, being rather rough, and showing slight globules of lead on the surface. The hardening effect of antimony is obtained at the sacrifice of ductility. A certain amount of nickel can be used for replacing tin with very satisfactory results. The castings produced when zinc is substituted for a certain amount of tin are decidedly unsatisfactory. The substitution of alumina for tin is entirely impractical, and such castings are worthless. The substitution of any other metals for tin in the Cu-Sn-Pb alloys can be made only by sacrificing its quality.

Concentration of Graphite Ore

By GEORGE D. DUB

[*]Ceylon and Madagascar have supplied 70% of the total graphite imported into the United States. Of this amount, 90% was used in the manufacture of crucibles. The use of domestic graphite before 1915 was confined largely to lubricants. In the past two years, imports of graphite were eight times the domestic output. The War Minerals Investigations last year made a survey of present mining, milling, refining, sampling, and analyzing methods; did experimental work in concentrating and refining to improve present practice; and made various tests in crucible manufacture. The graphite-producing States are Alabama, New York, Pennsylvania, and Texas.

At the present time there are 39 plants in the three graphite-producing counties of Alabama—Clay, Coosa, and Chilton. Early in October 1918, four of these plants were in course of erection, and fourteen were temporarily closed because of changes in method of treatment or because of plant fires. Thus, a little over half of the plants were then operating and only six were on full time. Even if the market required an expansion, it is doubtful whether labor would be available to enable all of the mills to operate two shifts per day. It should be noted that this industry has seen its greatest development during the past two years. It is natural therefore that operating difficulties should still cause considerable trouble.

Graphite occurs in the Talladega schist accompanied by quartz, feldspar, mica, and other accessory minerals and alteration products. At present only the upper 30 to 60 ft. of the graphitic schist is being mined. This consists of the decomposed and weathered part of the schist, and is normally rather soft and easily broken. For this reason operators are loath to work the unaltered 'blue rock'. Alabaman ore contains, as far as is known, no amorphous graphite. All of the operating companies have open-pit workings. With a single exception, all drilling is done by means of a 'jumper' drill, holes being put down 8 to 30 ft. All blasting is done with black powder. The deeper holes are chambered with dynamite or blasting gelatine. The ore is covered with 1 to 6 ft. of overburden, which carries some graphite. However, it contains so much clay and vegetal matter that it is removed and disposed of as waste to obviate milling difficulties caused by the presence of these materials. The overburden is removed by plows, scrapers, and wheelbarrows, this operation not involving much labor or expense. Machine-drills are employed at only one mine. At this mine self-rotating hammer-drills of the jackhammer type are used to drill holes 15 ft. in depth.

The ore in Alabama averages about 2½% graphitic carbon. From this is obtained in general three products: No. 1 crucible flake, No. 2 flake, and dust. The aim in concentrating is to recover as much as possible of the No. 1 flake, analyzing 85% graphitic carbon and remaining on a No. 8 silk cloth of 86-mesh. No. 2 flake, analyzing 75 to 80% carbon and of finer size than the No. 1, is a by-product for which the market is limited. Dust analyzes 30% or more carbon and is a greater drug on the market than the No. 2. In view of these facts the problem of ore-dressing is obviously complicated by the necessity of recovering as much as possible of the graphite in the ore in such form as to be marketable as No. 1 flake. The measure of efficiency therefore in graphite milling is not the percentage of extraction, but the number of pounds of No. 1 flake recovered per ton of ore. Unfortunately graphite plants do not make a practice of analyzing their mill-heads, and it is impossible, because of this fact, to establish a relation between the total graphite in the ore and the amount recovered as No. 1 flake. The by-product grades can readily be used in the manufacture of lubricating flake, paint stock, foundry

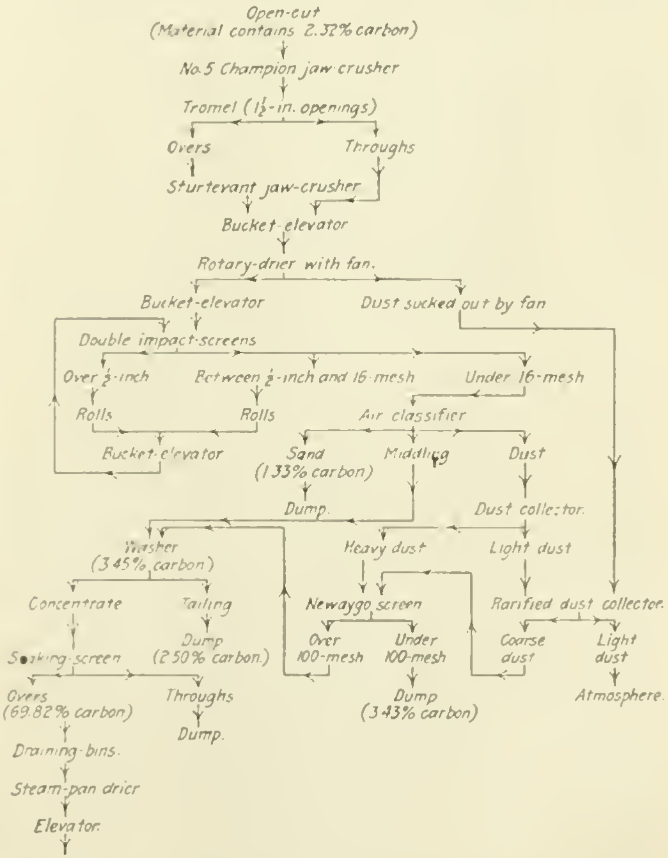

FIG. 1. FLOW-SHEET OF SKIN-FLOTATION SYSTEM

facings, stove polish, etc., but seemingly the demand for these manufacturing branches are not great, with the result that this market does not readily absorb all the No. 2 flake and dust produced.

---

[*] Abstract from War Minerals Investigation Series No. 3, U. S. Bureau of Mines.

Many different crushing machines and combinations are used in Alabama in the preparation of graphite ore. The coarse breaker most commonly used is a jaw-crusher of the Blake or Dodge type, which reduces the ore to 1½ inch. In some plants, a toothed impact-roll is used for coarse crushing. In plants where dry material is crushed fine, rolls, dry-mullers, or Symons disc-crushers are used to reduce the material to final-treatment size, which is about 1/16 or 3/32 in. For fine crushing in plants in which an oil-froth flotation method of concentration is used, coarse crushing is followed by some type of rotating mill, ball-mill, pebble-mill, or rod-mill. These machines are sometimes preceded by a Symons disc-crusher.

In general there are four methods of concentrating graphite ores, with several modifications, as described in the following notes:

In the water 'skin-flotation' system, a typical flow-sheet of which is shown in Fig. 1, the ore is crushed dry to 1/16 or 3/32 inch. It is then passed through a rotary-drier, screened, and passed over an air-separator, which classifies the material into three products—'scalping' or tailing, which goes to the waste dump; middling, which forms the 'washer' feed; and fine, which is generally treated on a separate group of 'washers'. The middling plus the fine, which form 50 to 65% of the crude ore, go to a bin for fine ore, from which the material drops to 'surface-tension' washers. In this machine, the graphite and some of the mica are floated off, on the surface film of water, while the gangue minerals are wet by the water and sink to the hutch of the washer which discharges to the tailing launder. The rough graphite concentrate is then dewatered on a trommel or shaking-screen, which also removes both the graphite too fine to make No. 1 flake and the fine sand that has been carried over into the concentrate by the film formed by the graphite on the surface of the water. The dewatered concentrate, a dry sample of which assays 40 to 60% graphitic carbon, is then dried in a rotary or steam-pan drier and sent to the finishing plant. Average figures for the amount of rough concentrate recovered per ton of ore are not available.

The variations in detail of this system are many and often unusual. Crushing differences have been noted above. There is quite as wide a variation in the types of screening and air-classifying apparatus used. For screening, Newaygo and 'whip-tap' screens are most popular; but other types of impact and shaking-screens are used, as well as hexagonal trommels. Most of the air-classifying apparatus is individually designed and erected, and gives results that seem to be efficient. Practically no work has been done to check the work of this class of machine, its operation being judged entirely by looking at the products without having even the 'scalpings' analyzed. So far as is known, no tests have been made on the 'scalpings' to determine whether, by regrinding, a sufficient additional quantity of No. 1 flake would be recovered to justify the additional treatment.

There are three types of 'skin-flotation' washers sufficiently distinct in principle to permit individual description. The sketches (Fig. 2 and 3) are given simply to illustrate the underlying principles in design, and the dimensions given are estimates and not actual measurements.

The Munro washer is a rectangular tank in which the feed drops from the feed cylinder to an inclined flat baffle, thence to the water-film, which carries the graphite to the collecting launder and permits the gangue to sink to the hutch.

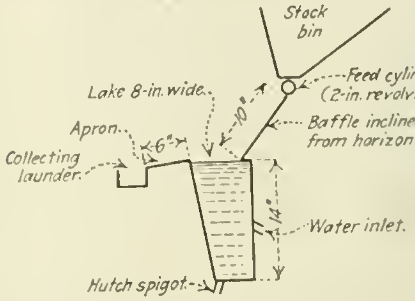

FIG. 2. SECTION THROUGH ORIGINAL MUNRO WASHER. THESE ARE BUILT IN UNITS 4 FT. LONG, PLACED END TO END AND BACK TO BACK. DIMENSIONS ARE APPROXIMATE.

The Colmer washer is a circular tank with a conical feed-baffle. The ore falls from the baffle on a revolving circular disc with ribs cast on it. The tangential motion thus imparted to the ore is intended to assist in carrying off the graphite, by reducing the tendency of the falling particles to rupture the surface film of water. Some operators claim that better results are obtained with this washer by keeping the disc stationary, relying on the disc solely to change the direction of travel of the particles of ore. It was claimed by these operators that the tangential motion given by the revolving disc produced a lower-grade concentrate than was obtained by maintaining the disc stationary. As shown in Fig. 3, the washer is about 42 in. diameter.

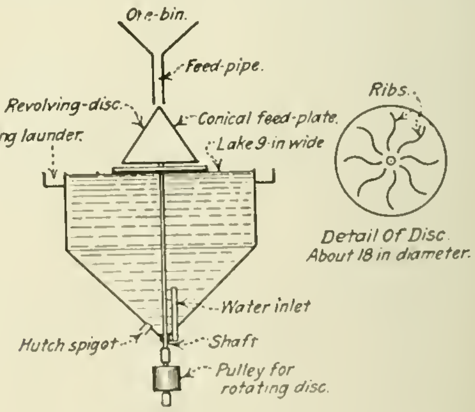

FIG. 3. SECTION THROUGH COLMER WASHER NOT DRAWN TO SCALE

The new Munro washer, which also is circular in shape, is 6 to 12 in. larger in diameter than the Colmer, most of this increase in size being taken up by increasing the width of the 'lake'. In this apparatus the treatment water is forced through an annular opening formed by placing a cast-iron cover over a bell-mouth casting attached to the feed-water pipe. This washer does away with the mechanical motion in the Colmer type. It is difficult, however, to keep an unobstructed flow of water through the annular opening.

In the treatment of graphite ores by the pneumatic process, pneumatic apparatus is used throughout. A typical flow-sheet for this system is not given, because it has been successful in only one mill. The details of the operation of this plant cannot be made public.

A typical flow-sheet of the log-washer process is shown in Fig. 4. In this method of treatment the crude ore is crushed and screened without drying. It is then treated in log-washers, kerosene being added to the water in the apparatus. The concentrate is screened, washed on a cement floor, drained, and dried. This system eliminates the expensive preliminary drying of the crude ore, necessary with the water skin-flotation. The simplicity and effectiveness of this plant are clear to the observer. The grade of rough concentrate made is excellent, and the only loss of any extent occurs in the coarse-sand tailing, which, with re-grinding, might be made to yield considerably more flake graphite. A test of the coarse-sand tailing in the same way that has been suggested under the discussion above with reference to the scalping of air-classifiers, would determine the feasibility of re-grinding. The fine-sand tailing is remarkably free from detached flakes of graphite.

FIG. 4. FLOW-SHEET OF LOG-WASHER PROCESS

The extent to which these various processes are used in Alabama is as follows, the figures including plants that are contemplating putting in systems under which they have been classified: (1) The skin-flotation washer system is used in 12½ plants, one of them consisting of two units, one of which is the Minerals Separation system; (2) the pneumatic system is used in three plants; and (3) the log washer system is used in two plants.

The majority of companies in Alabama have installed some type of oil froth flotation cell. Thus, 8 plants have put in the Callow pneumatic cells; four the Simplex type, 3½ (a two-unit plant has one skin-flotation washer system) have Minerals Separation cells; and 6 plants have or intend to have home-made cells or washers combining some of the principles of the above-enumerated processes.

The chief difficulty with an oil-froth flotation system seems to be in the loss of the large flakes. In recovering this, so low grade a concentrate is obtained that an added burden is placed on the finishing plant. There is no difficulty in obtaining a high recovery of high-grade dust, but there is at present no ready market for this material. The best results in the district are now being obtained from the home-made cells or washers mentioned.

In both the Minerals Separation and the Callow systems, fine crushing is accomplished by Marcy, Lehigh, Marathon, or Hardinge ball and pebble-mills. Water classifiers of the Deister or Gemmell type are used in practically all of the plants in which these two systems have been installed. In two plants Dorr classifiers are in use. As rough concentrate dewatering devices, vacuum-filters of the Portland or Oliver type are generally used rather than shaking-screens.

A typical flow-sheet of the Callow pneumatic system is shown in Fig. 5. This system has received greater development in the Alabama district than any other oil-froth flotation system. At one plant the tailing from the Callow cells are now being treated in a washer of home-made construction, with highly satisfactory recovery.

The Simplex system includes a method of crushing as well as concentration. The crushing apparatus has no particular advantage over other crushing machinery, but the concentration method appears to be efficient. In this system, the pulp comes unclassified to the centre of an elliptical washer on the surface of which jets of water, with flotation oils, are forced at a pressure as high as 40 lb. per square inch. The jet of water entrains air, and a froth is formed which floats the graphite over the side of the washer, while the gangue drops to the hutch. A sketch through the washer is shown in Fig. 6.

At the present time in various mills in Alabama, Wilfley and Deister tables are being installed to raise the grade of the rough concentrate and to remove gangue from the feed to the finishing plant. The gangue wears the surfaces of the buhr stones, necessitating their more frequent dressing, an operation that is both tedious and expensive. At one of the plants, concentrate from a table is being treated in an improvised pebble-mill. The dust is then removed and the material is passed through a series of screens, producing No. 1 flake ready for market. The most vital question to be considered in connection with the use of concentrating tables is their capacity. Unfortunately, experiments have not proceeded sufficiently to permit the presentation of any data as to the success of this new departure in Alabama.

The rough concentrate as it comes from the concentrating plants contains a minimum of 40% graphitic carbon. In some cases this crude concentrate is as high as 75% carbon, although the usual proportion is 40 to 60%. The impurities consist of quartz, mica, wood fibre, etc. Material of this character is not readily marketable except at prices far below those obtained for No. 1 flake. Moreover, the market for crude concentrate is limited. These facts therefore necessitate the refining of crude concentrate to No. 1 flake, containing 85% carbon and remaining on a No. 8 silk cloth of 86-mesh. Under the microscope the flakes are found to consist of thin laminæ of graphite, between which occur the minerals, chiefly quartz and mica, which must be eliminated to raise the grade.

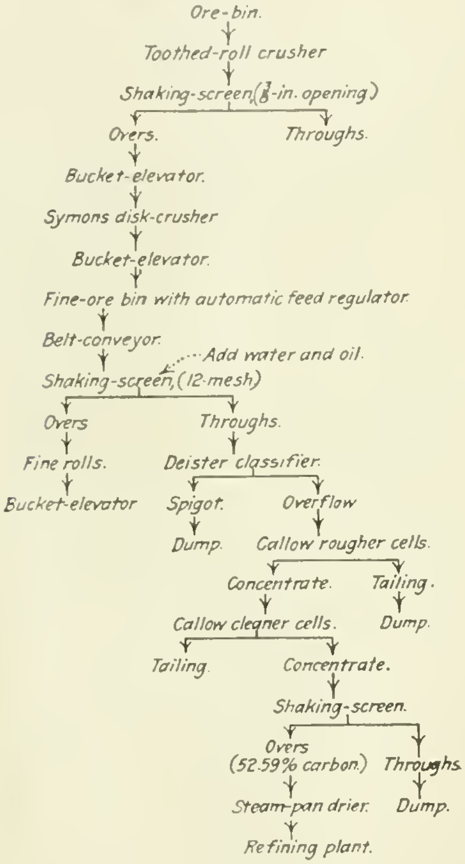

FIG. 5. FLOW-SHEET OF PLANT USING CALLOW SYSTEM

There are two general methods of refining, as follows: (1) If the crude concentrate comes to the finishing plant with most of the impurities inter-laminated or attached to the graphite, the crude concentrate must be subjected to grinding in a pebble or buhr-mill in order to separate the graphite laminæ or to free attached particles of the graphite, and (2) if, on the other hand, the crude concentrate comes to the finishing plant with the larger part of impurities as detached particles of quartz and mica, refining can be done pneumatically or with electrostatic machines. Where the latter methods are employed, crushing in the concentrating plant has been of such a character as to accomplish what is usually done in the finishing plant with the buhr or pebble-mill. The first method is the one most generally used; the second method is used by only two plants.

The average final products in Alabama are No. 1 flake containing 87% carbon, No. 2 flake with 77%, and dust with 30% carbon. A ton of ore yields, respectively, 19 lb., 5 lb., and 3 lb. of these grades. The recovery of the three grades totals 42.56%, leaving 54.44% in the tailing.

The cheapest plant to erect is the log-washer type, which is probably the cheapest to operate. No figures are available as to either initial or operating costs for a plant of this kind. For a plant capable of treating 10 tons per hour, the initial cost ranges from $35,000 to $60,000 erected, not including the cost of a finishing plant, which would add $5000 to $10,000 more.

Operating costs in the United States range from 6 to 14c., with an average of 10c. per pound of No. 1 flake. No allowance has been made in these costs for depletion and depreciation, which would add 1 to 2c. to the costs stated. In these costs the production of No. 1 flake has been charged with all operating expenses, and credited with the miscellaneous income derived from the sale of No. 2 flake and dust. The great variation in cost is due to difference in efficiency and in the grade of ore treated.

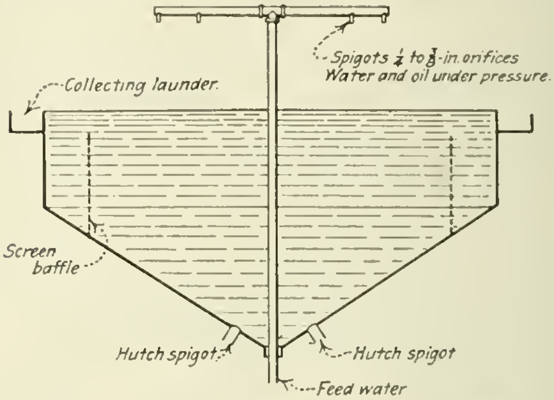

FIG. 6. SECTION OF SIMPLEX WASHER. NOT DRAWN TO SCALE

THE GREENE electrolytic furnace is of the rolling-cylinder arc-type. The 3-ton furnace at Seattle has two 5-inch graphite electrodes requiring from 500 to 600 kw. 2-phase, 100 to 110 volts. A 3-ton charge of scrap-steel is melted in 2 to 3 hours. The scrap is de-oxidized by the Greene slag-process, the slag being composed of sand, clay, or lime. The slag dissolves the iron oxides, which are in turn reduced by adding powdered coke or ferro-silicon to the charge. The elimination of iron oxides obviates imperfect castings caused by blow-holes. The newer type of 3-ton furnace has three electrodes, uses a 3-phase current and a 400-kva. transformer. The shell of the furnace is made of ¾-inch boiler-plate.

IN a patent recently granted to G. H. Clevenger, (U. S. 1,283,077) cobalt is removed from $ZnSO_4$ electrolytes containing manganese by neutralizing the electrolyte with CaO or ZnO and then precipitating the Co by the addition of an oxidizing agent such as $KMnO_4$. Another patent (U. S. 1,283,078) specifies the addition of β-naphthol, $NaNO_2$, and acid to the electrolyte, forming nitroso-β-naphthol which precipitates the Co.

The Ores of Tonopah, Nevada

By EDSON S. BASTIN and FRANCIS B. LANEY

*Depth of Oxidation. General oxidation is characteristic only of the upper portions of the few veins that crop out. In the upper portions of the veins that do not crop out and in the deeper portions of the out-cropping veins oxidation is local only. Such local oxidation was noted in some of the deepest workings near cross-fractures that intersect the veins. It is well shown, for example, on the 770-ft. level of the Tonopah Extension mine, the deepest level reached by the workings connected with the main shaft, where fractured ore and wall-rock just above the Rainbow fault are much more oxidized than those at a distance from the fault. On the 600-ft. level of this mine the Extension north vein is cut and offset by the Rainbow fault; for over 100 ft. west of the fault-plane proper the ore is much shattered and is considerably more oxidized than the less shattered ore farther west. Slight oxidation near fractures was noted in ore of the Belmont vein on the 1500-ft. level of the Tonopah Belmont mine. In the workings on the Murray vein slight oxidation was noted on the 1170-ft. level, but not on the 1260-ft. or deepest level.

Oxidation at Several Periods. At a number of localities in Tonopah there is evidence of oxidation connected not with the present surface but with ancient land-surfaces now deeply buried. The most striking evidence of this sort is found at several points near the 300 and 400-ft. levels of the West End mine, where the ore of the West End vein is capped for short spaces by the Fraction dacite-breccia. In the vicinity of the West End mine the Fraction dacite-breccia is the surface rock; its base appears to have a general south-westerly dip of about 30° and truncates the Midway andesite, the Mizpah trachyte, and in a few places the West End vein. The general structural relations are shown in Fig. 1.

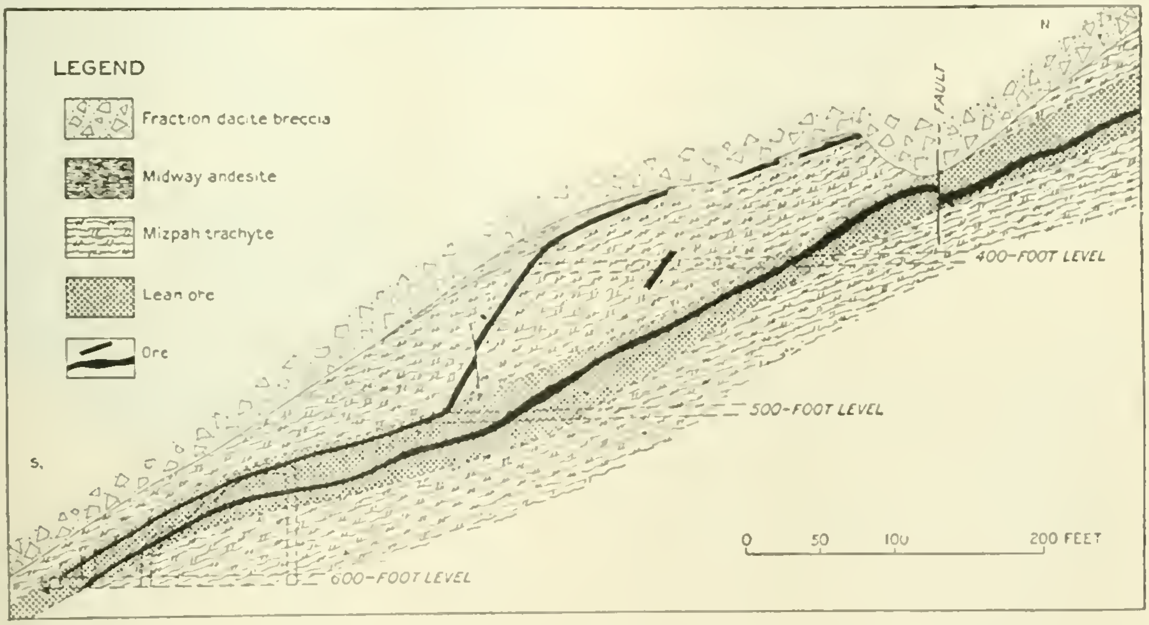

Fig. 1

The dacite-breccia is, at least in large part, a volcanic tuff, which, like the other volcanic rocks of the region, is believed by Spurr to be of Tertiary age. Its tuffaceous nature is suggested by its appearance to the unaided eye, but is especially evident under the microscope as shown in Fig. 2. The specimen studied microscopically and figured in this illustration was obtained near station 1447 on the 300-ft. level of the West End mine. It contains rock fragments irregularly angular in form and of various sizes and kinds; most of them are so much altered that their original character cannot be determined: some show plagioclase phenocrysts in a finely granular ground-mass. In addition, there are numerous fragments of quartz and feldspar phenocrysts, as shown in the illustration. The feldspar crystals are mostly andesine. A few of the feldspar crystals are perfect, but most of them are mere fragments, and many are very angular and irregular in form. Some are much fractured, not along cleavage planes but very irregularly; the fractures do not extend into the inclosing matrix. One feldspar crystal may be much fractured and another very close to it may be unfractured, indicating that the

---

*Abstracted from Professional Paper 104, U. S. Geological Survey.

fracturing took place before the crystals became embedded in their present matrix. Under high magnification (240 diameters) the matrix still appears fragmental and the fragments show diversity of size and shape. The smallest fragments are isotropic and are possibly volcanic glass. The alterations include part calcitization of the plagioclase, some secondary enlargement of quartz fragments, and the development of chlorite in certain rock fragments.

That the breccia is younger than the ore of the West End vein is shown by the presence of a number of fragments of ore and pyritized wall-rock in the breccia near its contacts with the vein.

Where the relations are not complicated by faulting the breccia appears to have been deposited directly upon the ore; in places it shows an obscure stratification parallel to the contact. Oxidation of the breccia near its contact with the vein is not general, but is usually confined to the vicinity of fractures, as shown in Fig. 3. Breccia in immediate contact with the vein may be wholly free from oxides of iron. The ore underlying the breccia, on the other hand, is as highly oxidized as much of the ore found at the present surface and carries iron oxides in mammillary and botryoidal forms. Some of the quartzose ore next to the contact is porous from part solution of its constituents.

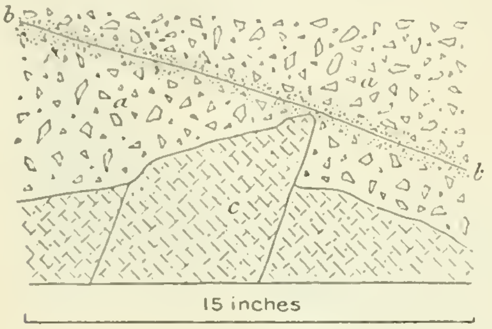

Fig. 3

The high degree of oxidation in the ore, the unoxidized condition of much of the breccia in contact with the ore, and the local inclusion of oxidized fragments of ore in unoxidized breccia indicate that much of the oxidation of this ore took place before the deposition of the breccia.

Other evidence leading to the same conclusion consists in the presence of coatings of calcite, barite, crystalline quartz, and, rarely, pyrite on the hydrous iron oxides of the ore just below the breccia contact. In ore from stope 484, not far above the 400-ft. level of the West End mine, a coating of crystals of a carbonate of iron and calcium is deposited on hydrous iron oxides. Some barite is intergrown with the carbonate. On top of the carbonate occur well-formed crystals of clear quartz. Locally, quartz has replaced the exterior of scalenohedral crystals of calcite which rest on iron oxide. Ore from stope 400A shows thin coatings of pyrite on hydrous oxides of iron. These associations, except that of quartz, constitute mineral misalliances, for the minerals of the coatings are not normally formed during the oxidation of a sulphide ore. Their presence is, therefore, indicative of a change in the physical and chemical conditions surrounding this ore. The structural relations indicate that this change was brought about by the burial of an ancient, probably Tertiary, gossan under a great thickness of volcanic tuffs, inducing a return from surficial to deeper-seated conditions.

Spurr[1] calls attention to the probability of a still earlier period of denudation and oxidation between the deposition of the Mizpah trachyte and that of the Midway andesite. He says: "Most likely the earlier andesite [Mizpah trachyte] was deeply eroded and the veins were exposed before the later andesite [Midway andesite] was poured out." The contact between these two formations is in most exposures a fault contact, so that conclusive evidence of oxidation during this period could not be obtained.

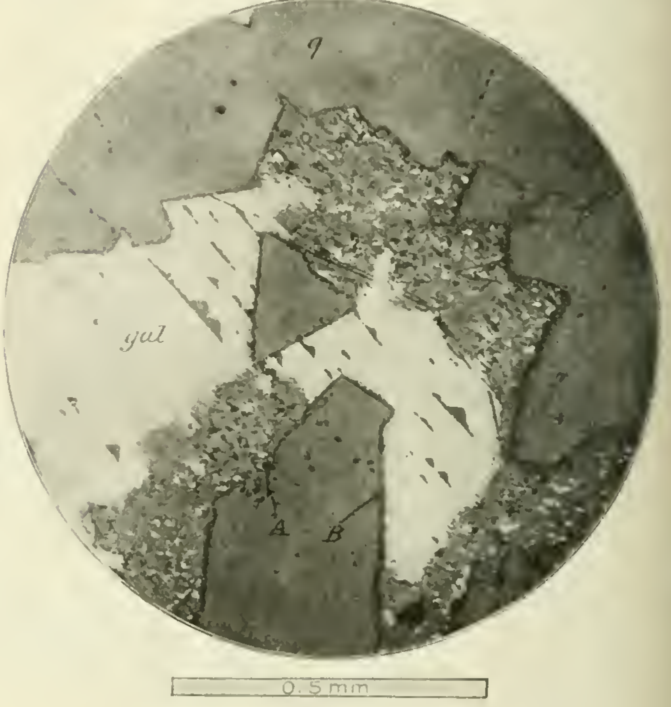

Fig. 2

From the evidence above set forth it may be concluded that although a part of the oxidation, even in those veins which do not crop out, is certainly recent, some is to be correlated with ancient, probably Tertiary, land-surfaces. As downward enrichment has been an accompaniment of the recent oxidation, it is logical to suppose that it was also an accompaniment of the ancient oxidation, and that there have, therefore, been several periods of downward enrichment.

GROUND-WATER. The common textbook diagram in which the water-table is shown as a subdued counterpart of the land-surface is applicable in a general way to regions, such as the Mississippi Valley, characterized by moderate humidity and flat-lying strata through which lateral circulation of ground-water is easy, but it does not at all express the relations at Tonopah. In the Tonopah mines the active ground-water circulation is practically confined to zones of fracturing; copious flows are limited to a few such zones and usually to their more open parts. Other fractures have, for considerable periods at least, and to great depths, been sufficiently free from water to permit extensive oxidation through the agency of the atmosphere. These relations were emphasized by Spurr,[2] who says:

---

[1] Spurr, J. E. 'Geology of the Tonopah Mining District, Nevada', U. S. Geol. Survey Prof. Paper 42, p. 35, 1905.

"No general body of ground-water has been encountered, although the rocks are extremely fractured; yet along certain steeply inclined fracture-zones water is found sometimes quite near the surface and occasionally in considerable quantity. This water is cool, is sufficiently non-mineral to be fair drinking-water, and is undoubtedly the storage of precipitation."

Spurr cites much evidence found in the sinking of shafts and driving of drifts illustrating the localization of the ground-water in fractures. Observations from later mining experience, reported to the writers, are wholly similar in their import and need not be enumerated here.

Ore-Storage Warehouses

By JAMES McNICHOLAS

Progress in construction of warehouses for the storage of zinc and lead concentrates in the Tri-State region of Missouri-Kansas-Oklahoma has been chronicled from time to time in the 'Mining and Scientific Press'. The Oklahoma Ore Storage Association of Picher, with an authorized capital of $500,000, is responsible for the work now under way. One building at Picher is finished, while one is being erected at Cardin and one at Century.

The warehouse at Picher is 200 ft. long and 36 ft. wide and has a bin capacity of 14,000 tons of concentrate. The building when finally completed is to be 600 ft. long, or three times the present capacity. These warehouses are 1½ miles apart. They are all built on the same plan as the Picher warehouse.

In order fully to understand the necessity for these warehouses, it might be advisable to explain the conditions pertaining to ore-buying in this region. First, the area in which these warehouses are built, comprising not over 50 square miles, contributes 40% of the entire zinc output of the United States. The production, as concentrates, amounts to 9000 tons per week. The concentrates consist of sulphide of zinc, averaging 60% metal. The smelters buying these concentrates are small, of 60, 70, and 100 tons daily capacity, yet there is a sufficient number of them in the aggregate to handle the output of this field. Now, the smelters supplied by this field are not custom works, in other words, the producers here are not privileged to send concentrates to the smelters after milling, but they must await the arrival of an ore-buyer who buys direct from the mills. Under the present system the price of spelter in New York in no way affects the price of ore here. The ore-buyers decide what price they shall pay and the amount they shall take each week, and that is the fixed price of the ores.

During the War, spelter prices have been higher than at any time known, while the price of zinc concentrates has been lower than at any time before. Of course the logical solution of our problems here would be the building of custom smelters with a fixed tariff on smelting. However, that condition does not exist, and the warehouse scheme was proposed as a missing link in the present system of ore-buying and selling between smelters and producers.

The idea is to issue bonded warehouse receipts to the producers, and to permit them to borrow from the banks during periods of depression until such time as the price of ore is satisfactory to the producers. The bankers of the district have all met in general session and have endorsed the scheme. They appointed a committee to get the endorsement of the Federal Reserve Bank of Kansas City. This endorsement has been secured, and upon this encouragement producers have organized themselves into an association, have selected five bankers of the district to act as officers and directors of the Association, and are now building warehouses situated in the field for the purpose of making a central depository for the ore and issuing bonded receipts to the producers. This arranges the collateral for the banks who are willing to loan on the ores. Similar warehouses could be erected for other ores in other parts of the country.

On Kruger mountain, Washington, within a few miles of each other are two lakes, one on each side of the international boundary, from which large amounts of natural epsom salts have been mined and shipped. Photographs of the lakes, made in connection with a study of the occurrence by Olaf P. Jenkins, suggest a snow-covered field with dark areas, nearly circular, and occupying about half the total area. The dark spots are shallow pools of brine, immediately beneath which are solid rock-like masses of epsomite. The areas between the spots are white and consist of efflorescent salts resting on black mud. During the rainy season the rise of water in the lakes causes the spotted appearance to vanish. The smaller of the lakes is in Washington, and contains nearly pure $MgSO_4$. The Canadian lake contains Na_2SO_4 mixed with $MgSO_4$. Other lakes in the vicinity show a predominance of Na_2SO_4. Rocks in the vicinity contain pyrite and pyrrhotite. These may, upon oxidation, have produced sulphates, which reacted with the magnesia and lime of the rocks. This view is supported by the fact that between the epsomite and the underlying metamorphic rocks is a thin layer of gypsum. A point of much interest is the expansive force with which a saturated solution of $MgSO_4$ crystallizes upon a sudden drop in the temperature. This was sufficient to split a 3-inch iron pipe from end to end. It was also found that crystallizing salts could not be kept in wooden tanks, as the solution would work into the cracks and upon crystallization would open the joints. Such tanks had to be lined with metal.

Oil and Oil-Lands in Time of Peace

By DAVID M. FOLSOM

*The title assigned to this paper is, in a sense, a misnomer, since it implies that the conditions surrounding oil-lands and the problems of the operating companies are different in times of peace from the conditions and problems of war. In actual fact the oil industry is facing conditions which are fundamental and are in no way related to war, although the War emphasized certain phases of the industry and the return of peace has removed this emphasis and restored normal aspects to the industry.

One fact which has been clearly demonstrated by the War is the inter-dependence of all industries and the fundamental relationship between fuel and the manufacturing and transportation facilities of the country. This is a relationship which is not changed by peace, although the extreme emergency conditions and fuel shortage of last winter were largely due to the War.

Oil may be considered from various viewpoints. Taking the broadest view, in considering petroleum and its products as a national asset, the products of the oil-well are as essential to the industrial and commercial life of our country as wheat is to our very existence. Fuel-oil means transportation, since it operates the railroads of the western and south-western States. Fuel-oil operates a great part of our shipping both in the Atlantic and in the Pacific; and both the Navy and the United States Shipping Board are committed to the future use of liquid fuel as the only practical means of propelling modern ocean vessels. Oil on land means power, light, and heat, since all of the Pacific Coast public utilities are, in part, dependent on steam stations. California points with pride to her hydro-electric power development in the streams of the Sierras; but the very heart of these power systems is the stand-by stations maintained by fuel-oil, and the installed capacity of steam-stations is greater than the installed capacity of hydro-electric plants. The artificial-gas plants of California, Oregon, and Arizona are dependent on oil, and this dependence of the public-utility companies on oil brings the wells in the field very close to the welfare and daily life of every individual on the Coast.

The widespread use of oil in industry connects the fortunes of the oil companies with the prospertiy of all mining enterprises; and the chemist, the metallurgist, and the miner on the Pacific Coast must find the problems of his own business intimately connected with the problems of the oil industry.

To summarize this preamble: Oil is not a 'war-baby'. The market for oil was not immediately affected by the declaration of war nor by the signing of the armistice. The industrial life of the Pacific Coast has been developed on fuel-oil, and the welfare of all commercial enterprises on the Coast is dependent on oil.

A question of interest to this Congress is the attitude of the administrative and legislative departments of the National Government toward oil and the development of oil-lands. I think this attitude can best be illustrated by a hypothetical case, a case, however, based on the actual experience of Californian companies. Assume a company with strong financial backing and organized in 1916 for the legitimate purpose of developing and operating petroleum land. Members of this American Mining Congress might have so organized and incorporated a holding company, under the name of the American Development Company, with the idea of developing national resources and providing an additional source of power and of wealth to the nation. Roughly speaking, there are three methods by which such a company can acquire prospective oil territory:

(1) By location and discovery upon public land;

(2) By leasing patented land from the owners and paying a royalty in oil or in money and, possibly, a cash bonus in addition to this royalty; and

(3) By the direct purchase of patented land.

Let us assume that the American Development Company, as a holding company, follows all three methods through subsidiary operating companies. Following the first method, the company, upon the recommendation of geologists, and acting with legal advice, locates a number of oil claims on public lands in a western State. This must be absolutely a wild-cat venture, since all land of probable value has long been withdrawn from entry and the property may be 50 miles from a railroad, in territory undeveloped and unknown.

The mining laws of the United States are, supposedly, intended to encourage such development and framed to reward the successful prospector. Judging by the history of recent years, the operating company, however, would have this experience: A test well, drilled to a depth of 3000 ft., representing an initial investment of over $100,000, might discover oil. Immediately, the President of the United States, acting on the recommendation of the Department of the Interior, would withdraw from mineral entry all the public land around the discovery-well except 160 acres, which would go with the discovery-well.

The first withdrawal of public land from mineral entry, made by President Taft on September 27, 1909, contained the following language:

---

*An address delivered before the California chapter of the American Mining Congress at San Francisco on January 15.

"In aid of proposed legislation affecting the use and disposition of the petroleum deposits on the public domain, all public lands in the accompanying lists are hereby temporarily withdrawn from all forms of location, settlement, selection, filing, entry, or disposal under the mineral or non-mineral public land laws."

The intent of this first withdrawal was, apparently, to protect the legitimate operator, and to provide legislation which would enable the petroleum fields of the West to be most efficiently and effectively developed for the good of the nation. In nine years and a half, however, administrative departments of the National Government have successfully blocked all legislation aimed at the development of public lands. As a result of this administrative policy, the American Development Company, with one well upon 160 acres, shut off from the acquisition of additional territory, would suddenly find its property a liability and not an asset. Instead of reward the company would actually pay a forfeit for its success and be penalized for adding a new oil-pool to the known national resources.

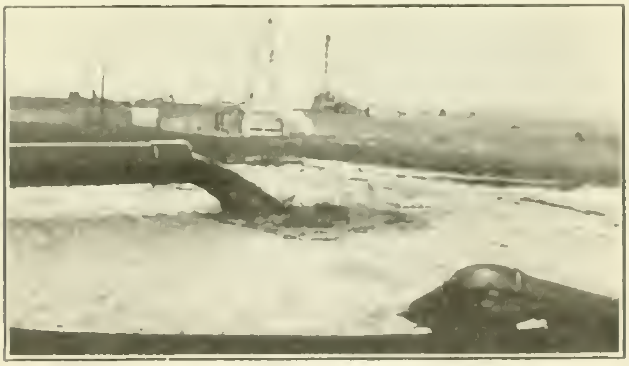
LAYING AN 8-INCH OIL PIPE-LINE

The theory which has been held by some Congressmen that oil-land can and should be developed by small companies with small land-holdings is based on an absolute misconception of the nature of the oil industry. Efficient development and operation of oil-land can be had only on areas which are large enough to justify the organization and equipment required to prevent waste and to insure economy of operation. Furthermore, the value of oil is dependent on its availability, and extensive pipe-line construction is warranted only where a large volume of oil is to be handled. The operating company would have no outlet for its production and would probably be forced to shut down and to abandon all operations. One venture of the American Development Company would be a failure although oil was discovered.

Carrying our assumption still further: If our holding company had acquired, through a second subsidiary, patented land on lease, paying a small cash bonus, and through successful development had brought in a substantial production of oil which the company was able to market at a profit, it would today be penalized for its prosperity, under the excess-profit tax, since the property was acquired since March 1, 1913, and the land-holdings under lease could not be capitalized. All production will be treated as income and a 60 to 80% tax collected on the net return.

In view of the risks incident to the oil business, and in view of the gradual exhaustion of oil and, therefore, of capital with each month's production of oil, the American Development Company would find itself paying taxes upon the profit without adequate return for the hazard taken, even with successful development upon patented land. To emphasize this point we have only to assume that upon the patented land acquired either by lease or by purchase no oil is found. In which case, the company stands the entire loss, although paying into the Federal Treasury the greater part of its profit for the one successful venture. The second venture of the company returns to the stockholders a small profit.

In the case of land acquired by the third method—direct purchase of patented land—the cost of the land can be taken as capital investment and written off in depreciation over a period of years. The most serious injustice to the individual stockholder or to a holding corporation from the present tax laws comes in the case of a man who may have an investment in several oil companies. Only one of these companies may be successful and that company pays an 80% profit tax to the Government with correspondingly small return to the stockholder, who at the same time loses his investment in other operations. In other words, the Government takes the lion's share of the profits without assuming any share of the risks of an extremely speculative and hazardous industry. It should be a recognized principle that no tax should be so burdensome as to extinguish its source.



CRUDE OIL FLOWING FROM WELL

Yet the case I have sketched is typical of many operating companies, and of the individual investor behind these companies, and illustrates the difficulty under which oil corporations are operating. In justification of the withdrawal of all public land the Federal Government takes the position that the oil resources of the nation must be saved for future generations; but, at the same time, the only substitute for oil on the Pacific Coast—the development of natural water-power—is also handicapped by equally prohibitive legislation.

There is no justification for the proposed features of the excess-profit tax except the great need for money and the unsympathetic attitude of many members of Congress toward private development of the public domain. I believe that the financial sacrifice and national debt assumed by the United States in the emergency of war can be met only by aggressive development of our natural resources and that the problems of the oil industry are so fundamental to the national prosperity of all industries as to require immediate and intelligent solution.

The United States is now committed to a government-owned merchant marine, and to the expansion of international commerce. What products are these ships to carry unless power is provided for manufacturing? And where are these boats to obtain fuel unless oil development and power development is encouraged?

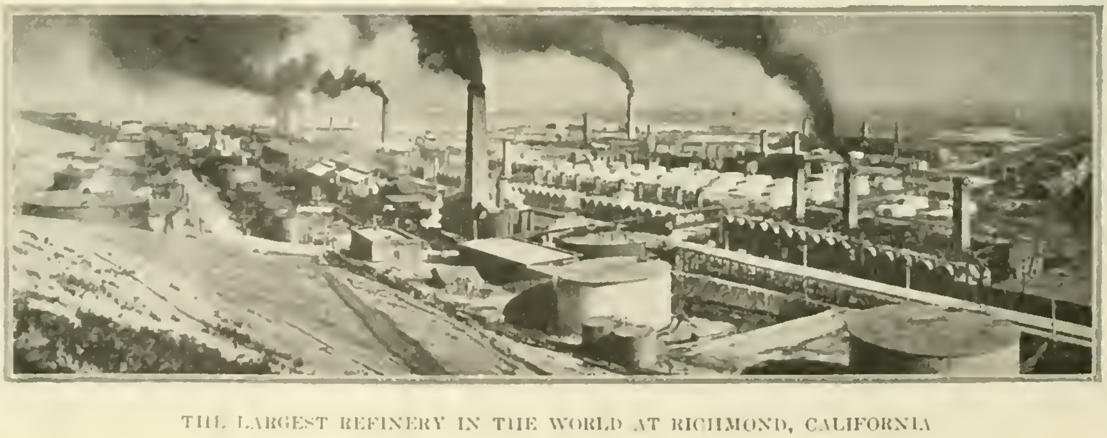
The Government, apparently, is trying to turn the wheels by hand when all the brakes are set hard and fast. I believe that with these brakes released the machine of national industry would run and run smoothly and noiselessly of its own momentum under the initiative and guidance of private, not public, ownership. I imagine someone saying, as various individuals inside and outside official Washington have said in the past: "Why not public ownership? Why not develop these oil-lands by the Government itself? Why allow private individuals or private corporations to control national resources?" To my mind there are many good and sound reasons why the Government should not attempt the nationalization of any industry; but I shall only mention two reasons.

To begin with, I question the possibility of Government success in the actual operation of any industry as many-sided and as sensitive as the oil industry. Nothing that the Government has done either before the War or during the War has indicated that Uncle Sam is as good a business manager or even a fair success as an industrial executive. Over and above that fact, however, as an argument against Government ownership is the fundamental character of the American people. If we have any national trait worth enlarging and worth preserving it is our initiative and our individuality.

America has developed as a nation of pioneers. The frontier line has never quite faded away and the race which has grown up on this continent has acquired its character and its liberty of action and its self-reliance as a result of the free opportunity given to the individual. This is so fundamental that I only emphasize it here because of the socialistic winds which blow through the world.

The will o' the wisp of nationalism, of paternalism, and of public ownership may tempt the dreamers and inspire the demagogue even in our own country, but, in their elusive visions of a Utopia, the dreamers forget that the human race has risen from the stone age through the acquisition of property and the human quality of selfishness. All human experience and all human wisdom points to national development through the opportunity for development given to individual initiative. I do not believe it is necessary before this Congress further to defend the best traditions of our nation.

In the past, each industry which has attempted to secure favorable legislation from Congress has had to work alone. The result has been that each industry has immediately and directly been accused of lobbying to its own interest and has been discredited before the committees of the National Congress in every attempt to obtain relief or justice from the legislative branch of the Federal Government. In turn, various groups of mining men, representing companies producing certain metals, attorneys for oil companies, and executives of power companies have appeared in Washington; have carefully and patiently explained to various committees the need of constructive legislation; and in regular rotation bills have been introduced in one or both houses of Congress only to die in committee or in conference. From time to time promises of legislation have been made, and Presidential messages have been written, in regard to the development of power and the release of withdrawn lands. But the temporary withdrawals still stand and the producer of power from water and the producer of power from oil are both prevented from developing the resources of the nation. This policy of repression was inconsistent and unfair before the War. It was almost fatal to the prosecution of the War and if continued will certainly be fatal to the development of a national constructive program for peace. I believe that the American Mining Congress or a similar organization, general in character, and representative of all Western industries, instead of a single interest, should direct its best efforts to creating in Congress a recognition of the national importance of legislation which will make public lands in America available for development by American citizens.



THE LARGEST REFINERY IN THE WORLD AT RICHMOND, CALIFORNIA

Silver: Market Factors and Future

*The position of the silver market at the beginning of 1918 was overshadowed by difficulties connected with the Indian currency. The prospects of any amelioration in then existing conditions were remote, and each return of the Indian currency showed a shrinkage in the holding of coined rupees, despite the volume of silver continually imported on account of the Mint. Events pointed toward the assumption of Government control in some form or other over the distribution and disposal of production—a comparatively easy measure to enforce in view of the large proportion of the world's supplies that is derived from America.

The quotation on the first working day (January 2) was 43½ pence, as it had been on the concluding day of 1917. Owing doubtless to the approach of the Chinese New Year (due on February 11), supplies were scanty, and an advance soon began which by January 5 had carried the quotation to 45½d., at which figure it remained until the middle of the month. From this point a decline set in, which, without a reaction, carried the price to 42½d. on February 22. It remained at this figure until March 8. During the whole period, a constant inquiry was maintained from Holland and France, mostly on account of coinage.

By this time the stock of coined rupees in the Indian currency reserve had reached a low ebb. On March 7 the total was returned as 1271 lacs (1 lac = $32,000), against 1905 on the eve of the year. Within the next month, the total fell to 1044 lacs, the low-water mark, not only for 1918, but also for eight years past. The issue of 1 and 2½ rupee notes (introduced last year with a view to easing the situation), did not make much impression. On February 15, for instance, not more than 5% of the total note issue was represented by notes below five rupees.

Attempts were made to induce Mexico to release a portion of its output, hitherto retained for local coinage. With this end, the United States government undertook to furnish Mexico with £1,000,000 in gold on condition that the latter relaxed its restrictions upon the export of silver. This, however, was only palliative in effect. The situation was aggravated by the firmness of the Chinese exchanges, with a corresponding demand for silver.

In these circumstances, some drastic action in America became necessary in order to cope with the keen coinage demand from India, evidenced by the drain of coined rupees from Indian currency reserves, and to minimize the efforts of China to replenish its silver stocks up-country, seriously depleted by the heavy shipments previously made to India. The United States, owing to the difficulty in obtaining remittances to India, had a direct interest in easing the situation. Hence it was decided to introduce a bill into Congress authorizing the realization of some portion of the reserve of 490,000,000 silver dollars, held by the United States Treasury as security for silver certificates to that value.

Meanwhile the price began to rise rapidly, accelerated doubtless by rumors as to the precise nature of the action which the American government was likely to adopt. Impelled by such considerations, the quotation reached 46d. on March 23. After remaining for a fortnight between that figure and 45¾d., the quotation again hardened, moving sharply, on April 11, from the last named figure to 46¾ pence.

The announcement that a bill was being introduced into the United States Senate, providing for the melting and sale of silver dollars above-mentioned, coincided with an announcement by the Indian Council that its drawing rate would be raised one penny—that is to say, from 1s.5d. to 1s.6d. (34 to 36 cents) per rupee for telegraphic transfers, and for other descriptions of drawing in proportion. At the minimum rate at which the United States government ultimately received power to sell the melted dollars, namely, $1 per fine ounce, and at the rate of exchange then obtaining between Great Britain and the United States, the cost of providing the silver contents of a rupee worked out at 1s.5.335d. (34.67 cents), to which shipping expenses, etc., from the United States to India had to be added.

The Bill granted power to melt 350,000,000 silver dollars (about 271,000,000 fine ounces) and to dispose of the bullion at not less than $1 per fine ounce. Immediately upon sale of the melted coin, the Director of the United States Mint was to be instructed to purchase in the United States, of the product of mines and reduction works in the United States, an equivalent amount of silver for each dollar so dealt with, at the fixed price of $1 per fine ounce. Purchases were to continue until the equivalent of the melted or broken-up dollars was acquired. As a result of this legislation, by means of which the United States placed itself in a position to obtain such rupee remittances as it required, the needs of the Indian government as to currency could be supplied also for a considerable time to come.

As a consequence of this Government action, the price of silver in America rose to about $1 per ounce. The quotation in this country (England) followed suit, and 49½d. was fixed on April 24. Since that date fluctuations have been slight, never exceeding 13/16d. below and ¼d. above. The price of silver practically became stabilized, and subsequent fluctuations represented little more than alterations in the cost of transit (war risk, insurance, etc.) from America to London.

The supply of silver coin in the United Kingdom

---

*Abstract from Annual Bullion Letter of Samuel Montagu & Co., London.

gradually became deficient, partly owing to the unsettled political condition of Ireland. Considerable consignments of newly-minted and other silver coin were sent to that island in order to provide currency in lieu of coin set aside in hoards. As a consequence, a Defence of the Realm regulation, published on May 21, made it illegal for a person to retain current silver coins in excess of the amount reasonably required for his domestic and business concerns. Further, it was made an offence to sell or purchase, or offer to do so, any current coin in excess of its face value.

Owing to the regulation forbidding shipment of silver without a license, and to the extreme difficulty of obtaining the necessary permission, neutral countries were in great straits to provide this metal either for coinage or industry. Indeed, so great did the scarcity become, that it was reported that in Holland current silver coin was being melted down in order to keep manufactories at work.

In the early part of June, the China exchanges developed great firmness, and in the next month this country acquired eagerly such American supplies as came into the open market. In consequence of the competition thus evoked, the export of silver from America, except under license, was officially forbidden. Whereupon export eventually came to a standstill, and the Shanghai exchange was quoted considerably above the parity of silver.

A Treasury Order dated August 9, 1918, published on the 13th, fixed the minimum price for silver in the United Kingdom at $48\frac{13}{16}$d. per standard ounce, at which figure it had remained since July 2. After having been quoted at $48\frac{13}{16}$ for 42 successive working days, the maximum price was raised to $49\frac{1}{2}$d. on August 21. This movement was caused by the fixation of an official minimum of $101\frac{1}{2}$ cents per ounce in the United States. As the demand was constant and active, the London quotation naturally rose at once to correspond.

The rise in the Chinese exchanges having been so pronounced as to cause grave embarrassment to trade with that country, and there being no check to the figure to which they could advance, now that it had become impossible to obtain imports of silver, the Chinese government decided to conserve the stock in that country by forbidding exports. This ameliorated the situation.

The fixing of official maxima in the United Kingdom and in the United States of America naturally deprived the market of animation, though trade demand in this country was well sustained, stimulated by the impracticability of securing sufficient gold for jewelry and like purposes. On September 11 the American gold and silver administrator met silver dealers in New York and obtained a promise that they would confine the supply to their old customers, and only to an extent of not more than 75% of their former requirements.

The French Commission on the stability of exchange asserted as follows: "The early establishment and permanent security of the gold exchange standard in countries now upon the silver standard would be materially aided by stability in the price of silver bullion. Stability in the price of silver bullion would be promoted by reasonable regularity in the purchase of silver required by each Government for actual coinage purposes." Any combination of nations, to ensure more or less continuous purchases of silver for the purpose of coinage, could hardly fail to draw India, the chief silver-using country, within its orbit.

The coinage of silver at the Indian Mints during the fiscal year 1917-'18 amounted to 23,87,07,287 rupees, compared with 30,77,07,326 rupees during the preceding financial year.

With the exception of 1,26,76,902 rupees re-coined from uncurrent and withdrawn coin, the silver was provided from purchases. The amount thus acquired and applied was therefore about 77,500,000 fine ounces.

In October, unsatisfactory climatic conditions caused a cessation of demand for Indian remittances and induced the India Council to offer sterling drafts on London to the extent of £1,000,000 per week. The all-important place in the destiny of India occupied by the monsoon, which has been described as the jugular vein of Indian trade, was thus again demonstrated. In normal times the reversal of the flow of remittances would have been reflected in the price of silver. Such, however, has been, and is still likely to be, the need for Indian metallic currency, that this check, possibly temporary, to the steady advance of Indian prosperity does not as yet relieve the Indian government from feeding its mints with fresh purchases of silver.

Although the India Council eventually raised the amount of sterling drafts on London offered in India for disposal by tender to £2,000,000 per week, the Indian note issue continued to increase, and the demand for metallic currency showed no sign of abatement. Therefore, while Government restrictions upon the export of certain goods were removed, owing to the great change in the aspect of military affairs, silver remained under a ban, except for articles manufactured wholly or partly of the metal. In America, about 2,000,000 oz. purchased for China some months back, but licenses for which were refused, were released for export, and were shipped from San Francisco.

The signing of the armistice, which brought hostilities to an end on November 11, had some effect upon the silver market. The quotation had remained at $49\frac{1}{2}$d. for 71 successive working days—a record duration in living memory—but the withdrawal of submarine activity at once reduced the rates of war-risk insurance. This substantially lowered the cost of bringing silver from America, and the price fell on November 12, $\frac{3}{4}$d. to $48\frac{3}{4}$d. (the new official maximum). Much variation cannot be expected so long as the value of silver in New York is maintained about $1 per ounce. The cost of insurance from America having been reduced to an almost normal figure, the quotation was lowered to $48\frac{7}{16}$d. on December 6, after remaining at $48\frac{3}{4}$d. for 21 working days. The official maximum was also reduced to $48\frac{7}{16}$. Notwithstanding this reduction, the closing quotation exceeded the average for the year. We append the annual averages for the last four years: 1915, $23\frac{11}{16}$d.; 1916, $31\frac{5}{16}$d.; 1917, $40\frac{7}{8}$d.; 1918, $47\frac{9}{16}$d.

It is an interesting fact that the first named is the lowest and the last-named the highest annual average for more than a quarter of a century. In 1909 the annual average was the same as in 1915, namely, $23\frac{11}{16}$ pence.

The return of erstwhile soldiers and war-workers to peaceful occupations will afford more labor for the mining industry, and, in so doing, increase the output of silver. Mexico, that great reservoir of precious metal, is setting her house in order, and will substantially swell the total.

As long as the United States government is pledged to re-purchase at $1 per ounce the bullion, composed of melted United States coin, which it placed at the disposal of the Indian Mint (at present amounting to 115,000,000 oz.), the price cannot fall much, if at all, below 46d. (allowing for the return of the American exchange to a normal figure). If there were external competition with the United States government, the re-purchase of this bullion, together with local trade requirements, would absorb probably two years' production of that country.

Trade all over the world has felt the lack of silver; hence a good and continuous demand may be expected from many quarters. As to coinage demand generally, no positive views can be expressed, for currency arrangements are now in a state of flux, rendering future policy as to the precious metals uncertain. In view of the shortage of gold that may prevail for many years to come, large supplies of silver for currency reserves may be considered desirable in other quarters. It must not be forgotten that many millions of medals will be struck.

Indian coinage operations will depend on the harvests. As gold may be scarce for some years, the onus of supplying India with currency will fall upon silver. Should unfavorable conditions (such as recently have obtained) continue, there may eventually ensue a redundancy of silver coin in India. At the present sterling value of the rupee (1s. 6d.), full-weight rupees would be worth about $48\frac{3}{4}$d. per ounce standard (exclusive of cost of bringing to market here in a marketable condition). Similarly if the sterling value of the rupee reverted to 1s. 4d., the worth would be about 43d. per ounce standard.

The deduction from the preceding remarks is, that although output may be accelerated, the needs of India and China, the obligation of the United States government to re-purchase, and the cumulated demand for the trade, will ensure a high level of prices for some time.

The table below gives the average price of silver for each year since 1860:

Year	Per oz.	Year	Per oz.	Year	Per oz	Year	Per oz
1860	$1.352	1875	$1.242	1890	$1.046	1905	$0.610
1861	1.333	1876	1.164	1891	0.988	1906	0.676
1862	1.346	1877	1.201	1892	0.871	1907	0.661
1863	1.345	1878	1.153	1893	0.780	1908	0.534
1864	1.345	1879	1.123	1894	0.634	1909	0.520
1865	1.338	1880	1.145	1895	0.654	1910	0.540
1866	1.339	1881	1.132	1896	0.675	1911	0.539
1867	1.328	1882	1.135	1897	0.604	1912	0.614
1868	1.326	1883	1.108	1898	0.590	1913	0.604
1869	1.325	1884	1.110	1899	0.601	1914	0.553
1870	1.328	1885	1.065	1900	0.620	1915	0.518
1871	1.326	1886	0.994	1901	0.595	1916	0.686
1872	1.322	1887	0.979	1902	0.527	1917	0.875
1873	1.297	1888	0.939	1903	0.542	1918	0.968
1874	1.278	1889	0.935	1904	0.578		

Prevention of Illness Among Mine Employees

By A. J. LANZA

*This subject is especially important in view of the magnitude of metal mining, the unsettled conditions of labor, which emphasize the economic necessity for conservation of labor, and for humanitarian reasons. The burden of chronic illness is altogether unwarranted and unnecessary. If the industry is to maintain its labor supply in an efficient manner and keep the standard high, it is essential that it make every effort to keep its labor in good physical condition.

The first step in the prevention of illness lies in securing employees who are in sound health and free from organic disease. I do not mean that all men who go underground should be physically perfect, but they should be free from defects of the heart, lungs, and other organs; or from anatomical defects which would markedly increase their liability to accident. The number of men underground in this country whose physical condition totally unfits them for such work presents a condition that should not be allowed to continue, which I believe is not equalled in any other industry in the country. There is but one way to secure men who come up to the required standard, and that is by a thorough physical examination before employment. I am fully aware of the objections felt toward such a procedure by many employers and employees. There is much to be said on both sides, but to any one who is at all familiar with the mining industry as it is today, and who approaches the matter with an unbiased mind, there can be no doubt as to the necessity for such an examination. As a purely logical idea this is self-evident, but there remains the further necessity of placing these examinations on such a basis that they can be administered in a just and equitable manner, free from the abuses and suspicions to which they have been subject in the past. The best way of administering this work would be to have them conducted by properly constituted authorities of the various States. I believe that the time has come for the American Institute of Mining Engineers to consider seriously the necessity and the means for carrying out physical examinations and to take a definite stand.

The second requisite for the prevention of illness among employees is the maintenance of working conditions underground on a high plane of sanitation and efficiency, so that sickness arising therefrom may be held at a fair minimum. The greatest needed improvement is the elimination of dry drilling in hard-rock mines. Ventilation and temperature are not what they should be, and have never received the attention in metal mines that they have in coal mines.

The third requisite consists of adequate provision for medical and surgical service, so that minor illness and injuries may be promptly treated and not become of major importance.

---

*Abstract from Bull. 146 of the A. I. M. E.

Sulphuric Acid Forecast for 1919

In a report recently issued by the Chemical Alliance a forecast of the output of sulphuric acid in 1919 was presented, this having been prepared by Arthur E. Wells, metallurgist of the U. S. Bureau of Mines. He shows that, on January 1 of this year, the total manufacturing capacity of the United States for sulphuric acid was 427,000 tons per month, on a basis of 100% H_2SO_4, or 8,200,000 tons per year, on a basis of 50° B., of which 29% was at contact-acid plants. On November 1 of this year, the total manufacturing capacity of the country was 500,000 tons per month, on a basis of 100% H_2SO_4, or 9,600,000 tons per year, on the basis of 50 B. Of this total capacity 40% was at contact-acid plants. This capacity was divided among: (1) the Government; (2) explosives companies; (3) all others, including commercial manufacturers and by-product manufacturers, as follows:

	Capacity	
	In tons per month, 100% H_2SO_4	In tons per year, 50° B.
1 At Government plants	54,000	1,040,000
2 At plants of explosives manufacturers	58,000	1,120,000
3. All others	388,000	7,440,000
	500,000	9,600,000

Inasmuch as the acid market conditions in the inter-mountain and Pacific coast districts are quite distinct from those in the East, and as very little, if any, disturbance has been brought about in those districts, except possibly for some slight disturbance in the San Francisco district, it is not necessary to include the figures for these in the discussions regarding Eastern conditions. The total capacity east of the Mississippi river, including the plant at Argentine, Kansas, and the plants in Louisiana and Arkansas, is as follows:

	Tons per month as 100% H_2SO_4
1. At Government plants	54,000
2. At plants of explosives companies	50,000
3 All others	350,000
Total	454,000

Assuming that the Government plants and the contact-plants, which were built by the explosives companies primarily to supply acid for munitions, are not operated in 1919, or, if operated at all, the production will be utilized only for munitions, and thus will not be placed on the market, there remains a total capacity to be considered in the eastern part of the United States amounting to 365,000 tons per month, on a basis of 100% H_2SO_4, or 7,000,000 tons per year, on a basis of 50° B. During the first nine months of 1918 the actual rate of production was only about 90% of the rated maximum capacity, although many plants were operating much above the rated capacities. Therefore, it is fair to conclude that the probable maximum output from these plants during the year 1919 cannot be greater than 90% of the rated capacity, or in other words, the maximum output could be only about 328,000 tons per month, on a basis of 100% H_2SO_4, or 6,300,000 tons per year, on a basis of 50° B. During the months of June, July, and August 1918 the following industries in the eastern part of the United States consumed approximately the following tonnages of acid:

Industries	Tons per month basis 100% H_2SO_4
1. Domestic explosives	7,500
2. Fertilizers	109,400
3. Chemicals and drugs, including nitric acid, hydrochloric acid, and ammonium sulphate	37,600
4. Oil refining	28,700
5. Steel pickling and galvanizing	36,200
6. Fabrics, textiles, tanning, rubber, paper, and bleaching	5,100
7. Paints, lithopone, dyes, glue, glycerine, and alcohol	7,200
8. Storage batteries, metallurgical work	4,700
9. Miscellaneous and unknown	3,600
Total	240,000

This is equivalent to 4,600,000 tons per year on a basis of 50° B.

It is believed that the consumption of acid in the various industries during the period given above offers a better basis for estimating the future consumption during 1919 than any reference to the figures for 1914, but it may be stated by way of comparison that in the eastern half of the United States there was consumed in 1914 about 3,500,000 tons of acid, on a basis of 50° B., according to the figures compiled by the Geological Survey. From these it is evident that, between the years 1914 and 1918, there was an increase in the requirements of acid for industries, other than munitions, amounting to about 1,000,000 tons, on the basis of 50° B. The consumption of acid for fertilizers will undoubtedly be greater in 1919 than in 1918, and will probably average at least 130,000 tons of 100% acid per month, or 2,500,000 tons per year, 50° B. Thus, with business conditions favorable, the average monthly consumption of acid in the above industries in the eastern part of the country during the year 1919 should not be less than 260,000 tons per month, on a basis of 100% H_2SO_4, or 5,000,000 tons per year, 50° B. This would require operating all the plants at about 71% of the rated maximum capacity, if the business were distributed proportionately to the manufacturing capacity in the various districts. As a matter of fact, the Southern fertilizer plants will probably operate to full capacity, while the plants in the Boston, New York, Philadelphia, and Baltimore districts may average less than 70% of the rated capacity.

The production and consumption of acid in the western half of the United States will probably be about 500,000 tons per year, 50° B., so that the probable total production for the whole country will be about 5,500,000 tons in 1919.

Copper Selling Agencies

According to the 'Boston News Bureau', many important changes have taken place in selling agency affiliations. The following table gives the principal selling interests, and their 1918 totals, in pounds:

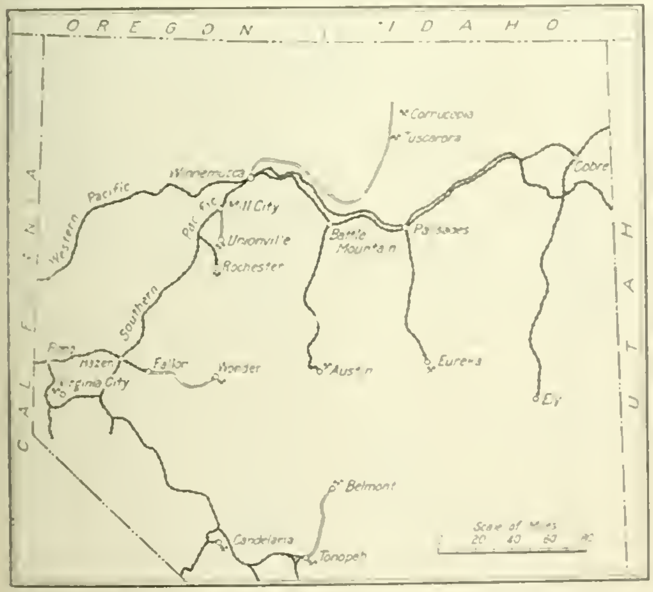
American Smelting & Refining Co.	713,000,000
American Metal Co.	54,000,000
Calumet & Hecla and subsidiaries	140,000,000
Lewisohn & Sons	70,900,000
Mohawk Mining Co. (direct)	10,700,000
Phelps Dodge Corporation	353,000,000
Todd, W Parsons	82,000,000
United Metals Selling Co.	566,000,000
United Smelting Co.	21,000,000
United Verde Copper Co. (direct)	60,000,000
Wolverine Mining Co. (direct)	4,200,000

REVIEW OF MINING

RENO, NEVADA

Silver From Candelaria and Unionville.—Leasing at Goldfield.

Silver ore carrying from 20 to 40 oz. per ton is being shipped to smelter from properties operated by the Candelaria Mines Co., at the old camp of Candelaria, near the boundary between Esmeralda and Mineral counties. The Argentum and Mt. Diablo mines were worked in the late 'seventies, and were among the largest of Nevada silver producers in that period. The district was then known as the Columbus. The adjoining Lucky Hill property, also owned by the Candelaria Mines Co., is being worked through a tunnel and shaft. Stopes on the 100 and 200-ft. levels are breaking from 8 to 11 ft. of shipping ore, and a large tonnage of milling ore has been exposed. The first-named properties have a large quantity of impounded tailing from the old mills that is said to be valuable. Four carloads of smelting ore was shipped during the last week of January. Ore is shipped at a rate sufficient only to pay for development and leave a moderate surplus. A. J. Jarmuth is manager.



PART OF NEVADA

A flotation mill has been completed at Unionville, in southern Humboldt county, to treat ore from the once famous Arizona silver mine, owned by the Sunset Mining & Development Co. Connection with the old mine workings has been made by a 390-ft. tunnel, giving access to the ore-channel below any point reached before. The ore, a straight silver sulphide, is found in a wide bedded zone, lying nearly horizontal and worked in earlier operations to a depth of only 250 ft. The mine is said to have produced $5,000,000 in the 'sixties, the high-grade ore having been shipped to Wales by way of Sacramento. It was located in 1862, and the richest ore was freighted to the Coast before the railroad came to Nevada. E. S. Van Dyck, vice-president, is now at the mine. He says that a relatively small part of the ore-channel has been prospected. F. W. Lockman is superintendent. The ore has been tested for flotation, and is said to be well adapted to that process.

The new leasing policy of the Goldfield Development Co. will give longer lease terms, with no restrictions on profits, and ample time for the removal of ore extracted. It is expected, together with operations planned by the new company, to result in a more energetic and more venturesome policy of mining in this area, a large part of which has not been prospected. The company will furnish equipment, air, timber, and supplies to the lessees at about cost, and its own work is designed to produce ore for company account and to open the properties for leasing. The manager, H. G. McMahon, reports over 100 applications for leases already in hand. It is not likely that lessees will for the present undertake work on deep levels, as the product contains copper and the Consolidated company is opposed to resuming the operation of its flotation plant until the copper market is stabilized.

In a report on the Atlanta property, the manager, A. I. D'Arcy, says that a considerable quantity of milling ore has been exposed, and the east cross-cut on the 1900-ft. level, driven to cut the Atlanta vein, has lately shown several seams of good ore, assaying as high as $59 per ton in gold and copper. While the lens-shape of the deposits renders it impossible to estimate the tonnage, he believes sufficient ore will be available soon to warrant leasing or building a mill.

DURANGO, COLORADO

Conditions and Operations in the San Juan.

Silverton.—The decline in lead and copper and present high costs are handicapping operations of smaller producers, as the average ores of the district carry the greatest value in these metals. Despite the fall in metal prices, there is a spirit of optimism prevailing and development continues. The present miner's and operator's agreement continues in force until July 1, 1919, and the present wage-scale will prevail until that date, when it is expected that there will be a re-adjustment. Health conditions here are excellent. The labor supply is growing rapidly, owing to the importation of men from outside points by the Sunnyside M. & M. Co., and the closing of the Rico mines. If operating costs permit, there are a number of mines ready to ship during the coming season, but until the metal market is better no decided change may be expected.

The Sunnyside M. & M. Co. now has 350 men employed and is increasing the number. As soon as more are at work underground the mill will be increased to full capacity. At the present time lead concentrate is shipped at the rate of one car daily, and zinc concentrate at the rate of 10 tons. A shortage of expert machine-men is being relieved as a result of extensive advertising, the present scale is $5.25; board is still furnished at $1. The low prices for lead and copper seriously affect the company, and if there is no betterment, the extensive production planned for the current year may be curtailed.

The Gold King Extension Co. is hurrying preliminary work. Delay in receiving milling machinery has postponed operations somewhat, so that the date of the opening run is postponed until the latter part of April. The Gladstone branch of the Silverton Northern railroad continues to run, no difficulty having been experienced with slides. A number of new Card concentrating tables have been ordered. Although the mill may not be running until the time mentioned, a little will be shipped for testing, and there will be a small quantity put through the stamp-mill during early spring.

The Dives Leasing Co. is now shipping much high-grade silver ore, and it is expected that the Dives will shortly resume its place as one of the foremost producers of the district.

Red Mountain.—This district will be seriously affected by the recent fall in copper, as the ores of the district carry the highest value in this metal. At present there are two mines shipping ore. King, Levingood & Co. are handicapped in getting ore from the Congress, as it is hauled to the Silverton station of the D. & R. G., so that in addition to the high railroad freight, there is a haulage charge of $6 per ton. The roads are in good condition, and the operators are getting out large quantities of ore. Klang & Carlson are leasing the St. Paul mine and are hauling ore to Silverton by sled.

The Radiant Mining & Reduction Co. has taken over the holdings of the Ruby Mining Co., comprising 450 acres and 50-ton mill. A few men have been employed for some time, and the mine is now to produce. Officers of the new company are H. M. Kingsley, A. B. McClave, and O. L. Keen, all local men.

After a period of low production, due to shortage of labor, the Mayflower mine is again on the shipping list, concentrate amounting to 2 cars per day.

The D. L. & W. M. & R. Co. continues to open the Lackawanna. The double-compartment raise between levels is finished, permitting easier handling of ore from both levels, also improving ventilation. A vein of $20 ore has been cut on No. 2 level, ore from 8 to 10 ft. wide, and a drift 60 ft. along the vein shows the quality and width not lowered. On No. 1 level, driving operations continue, a distance of 200 ft. having been made into a good grade of milling ore. A large quantity of ore is blocked out and ready for shipment. At a recent election of officers the following were chosen: George Harris, president; Fred Free, vice-president; Hugh Dealy, secretary-treasurer; E. Dealy, general manager; and E. W. Walter, consulting engineer.

Rico.—The rapid decline in copper has caused an almost complete shut-down here. The Rico Argentine has ceased and the Rico-Marmatite has only 20 men employed. Little ore will be produced from the Marmatite holdings until operating costs and metal prices permit of a profit being made. As the ores of this district carry copper, the uncertain condition of the market has stopped development on a number of promising properties, in addition to this, health conditions have become bad, so that the district is now having a trying period. However, the Rico Mining Co. continues to develop its orebodies. The Resolute company has run into a body of high-grade silver ore on the Telegraph vein, and the Syndicate company is to continue operations.

Placerville.—The New Era vein is being worked by D. H. Donegan, who has shipped vanadium ore in large quantities to the reduction plant at Vanadium.

Development on the old Placerville property held by the Primos Chemical Co. is now completed, compressed air is piped to the machine-drills in the workings, a two-bucket tram conveys ore to a dumping-bin alongside of a newly-constructed railroad switch, and the ore is moved to the reduction plant of the company at Vanadium from the workings with a minimum of expense and labor.

Interest is directed toward the Cashin copper mine in Paradox valley, as a new company has been organized to operate it and contemplates its purchase. Large bodies of copper ore are known to be exposed. Numerous attempts have been made to secure a lease on this property by local mining men, but without success.

Telluride.—Exploration was to be resumed in the old Calumet during February, after a shut-down since the beginning of the year.

De Beque.—With the near completion of the tramway from the shale-beds to the retorts, the Mt. Logan Oil Shale Co. expects to be producing oil within a few days. The retorts have a capacity of 60 tons per day of shale, and the first runs are awaited with keen interest.

WASHINGTON, D. C.

Provisions of the Revenue Bill for Income-Tax.—Potash.

The Commissioner of Internal Revenue has issued the following notes:

The income-tax provisions of the Act reach the pocketbook of every single person in the United States whose net income for 1918 was $1000 or more, and of every married person whose net income was $2000 or more. Persons whose net income equalled or exceeded these amounts, according to their marital status, must file a return of income with the collector of internal revenue for the district in which they live on or before March 15.

Penalties are as follows:

Failure to file a return on time entails a fine of not more than $1000 and an additional assessment of 25% of the amount of tax due. For wilfully refusing to make a return on time, a fine not exceeding $10,000, or not exceeding one year's imprisonment, or both. For making a false or fraudulent return, a fine of not more than $10,000, or imprisonment for not more than one year, or both, together with an additional assessment of 50% of the amount of tax evaded. For failure to pay the tax on time, a fine of not more than $1000 and an additional assessment of 5% of the amount of tax unpaid, plus 1% interest for each full month during which it remains unpaid.

In addition to the $1000 and $2000 personal exemptions, taxpayers are allowed an exemption of $200 for each person dependent upon them for chief support if such person is under 18 years of age and incapable of self-support. Under the 1917 Act, this exemption was allowed only for each dependent child. The head of a family—one who supports one or more persons closely connected with him by blood relationship, relationship by marriage, or by adoption—is entitled to all exemptions allowed a married person.

The normal rate of tax under the new act is 6% of the first $4000 of net income above the exemptions, and 12% of the net income in excess of $4000. Incomes in excess of $5000 are subject also to a surtax ranging from 1% of the amount of the net income between $5000 and $6000, to 65% of the net income above $1,000,000.

Payment of the tax may be made in full at the time of filing return or in four installments, on or before March 15, on or before June 15, on or before September 15, and on or before December 15.

Revenue officers will visit every county in the United States to aid taxpayers in making out their returns. The date of their arrival and the location of their offices may be ascertained by inquiring at offices of collectors of internal revenue, post offices, and banks. Failure to see these officers, however, does not relieve the taxpayer of his obligation to file his return and pay his tax within the time specified by law. In this case taxpayers must seek the Government, not the Government the taxpayer.

In the bill of Senator Henderson of Nevada to protect American potash producers, the maximum price for the first year is $2.50 per unit, and for the second year $2. Imports would be regulated thereby.

THE MINING SUMMARY

ARIZONA

Bisbee.—Shattuck Arizona pays 25 cents per share on April 19. The amount is $87,500 and makes $262,500 for the current year and $7,348,000 to date.

A report issued by a committee claimed to represent the I. W. W. announces that no strike is contemplated in the Bisbee district.

Mayer.—It is reported that J. C. Rankin of Kingman has purchased the McCabe and Gladstone mines. The former mine was worked extensively about 20 years ago.

The England and France claims have been taken over by the Arizona Binghampton Copper Company.

Patagonia.—Grading is under way at the Hardshell mine, preparing for the surface plant and new shaft which is to be sunk to the 350-ft. level.

Prescott.—The U. S. Consolidated Mining Co., which is operating the Homestead mine in the Walker district, is to put in a new hoist, air-compressor, and an 80-hp. boiler. The 150-ft. shaft is to be sunk another 300 ft. Fifteen hundred feet of development work has been done on this property so far with encouraging results.

Superior.—Magma Copper Co. produced 900,000 lb. in January, a drop of 149,000 pounds.

Wickenburg.—The Towers ranch has been leased to Brooklyn, New York, people, who have commenced work on the Green Mountain mine, on the ranch. It is one of the oldest properties in Arizona, and has produced considerable gold and silver in the past.

CALIFORNIA

Bakersfield.—Oil production of all fields in January totaled 277,363 bbl. per day, from 8617 wells, according to the Standard Oil Co. Fifty-two new wells were completed, yielding 17,375 bbl. Stocks at the end of the month were 32,299,589 bbl., an increase of 256,666 barrels.

Twelve wells were reported to the State oil and gas supervisor, R. P. McLaughlin, as ready to drill during the week ended February 15. This makes a total of 80 wells reported since the first of the year, against 112 for the same period of 1918, and 144 for the same period in 1917. This indicates a continued decline in drilling activity. It is certain that such a condition cannot continue for any length of time without a noticeable decline in State production. The flush yield of the no longer new Montebello and Casmalia fields masked this condition temporarily. However, the history of oilfield development, even if present production data of the Montebello and Casmalia fields were not available, should warn operators against counting too heavily upon initial productive conditions. Rapid decline of gas pressure and improper drilling, with respect to protection from water, are two of the principal causes which prevent oilfields from maintaining their brilliant initial records. Gas pressures can be controlled to a large extent, and their expulsive powers conserved by the proper drilling and preparation of wells for production. However, the supervisor has on a number of occasions directed popular attention to the fact that even the new fields of the State have not been drilled in a manner best to conserve the petrolum resources and protect them from water. One example of such operations in the Montebello field should suffice to quiet any claims to the contrary. One well in the Montebello field—drilled by one of the largest companies—produced 70.3% of all water produced during the fiscal year ended June 1918. The average water production for all other wells was 3%. The average daily production of oil was 722 barrels.

Keswick.—The Mountain Copper Co. has reduced wages from $4.50 to $4, and from $4 to $3.50 per shift. The three principal copper companies in Shasta county are now paying at the same rate.

COLORADO

Boulder.—The latest concerning the Colorado Pitchblende Co. is that it has started suit against the mining bureau of the Denver Civic and Commercial Association, alleging conspiracy, the Association withholding a report made on the company's property. The bureau states that the report will be issued in due time, and that it will not be bulldozed in the matter.

In a full-page advertisement in the 'Denver Times' of February 20, the Colorado Pitchblende Co. states that J. M. McClave's report on its property at Jamestown more than substantiates that of M. S. MacCarthy. McClave estimates that with a 1000-ton plant a daily net profit of $11,850 is probable, or $4,266,000 per year. MacCarthy estimated $9140 per day.

Central City.—W. O. Jenkins, representative in the State Legislature, sent a copy of the new 'blue sky' law to the local chapter of the Colorado Metal Miners' Association for criticism. In its reply this body said in part: "We have given this bill a careful scrutiny, and came to the conclusion that it contains several very objectionable features."

Golden.—In the School of Mines Quarterly for October last, Colorado's future as an oil producer is discussed by Victor Ziegler, professor of geology and mineralogy in the School. In his conclusions, he says that Colorado lacks persistent sands capable of acting as reservoirs. Those present are either very thin or very much restricted laterally. While there are a number of large and well-defined structures in the State, it is unfortunately true that the more promising horizons of the Cretaceous are eroded off the surface, or are absent, or are so deeply buried as to be out of reach of the drill. Large fields need, therefore, not be expected in Colorado. The chances are bright of finding a few widely-scattered fields with wells of small capacity, yielding a high-grade oil.

IDAHO

The State Senate has passed a memorial asking Congress to appropriate $500,000 with which to construct a highway up the south fork of the Clearwater river in central Idaho. According to I. L. Jones of Elk City, "the great region of north-central Idaho has been served by a mountain road not worthy of the name of road, which commences at a point 1240 ft. above sea-level, ascends to 6500 ft., then descends 2700 ft. into a valley, and ascends to 6700 ft. altitude before dropping down into Elk City basin, which has an altitude of 3900 ft., and is considered the trading centre of the district. The entire trip is made either through a sea of mud or over an uneven rock road-bed, which four and six horse-teams are ever struggling to negotiate, a distance of 52 miles in three days. This is the only way the miner, the farmer, and the stockman has of getting in and out. The proposed water-grade road up the south fork of the Clearwater river would open districts tributary to having good bench lands upon which clover and grasses grow in abundance, and upon which farms have been cut out of the forest. The pastures of many of these farms are filled with cattle and hogs which will compare with any raised in the most favored districts of the North-West. Farming has extended into the Red River district, which is one of the tributaries of the south fork. This development is being done by the same pioneer stock that blazed the way through the West and many of them have prospered abundantly. Large numbers of outside cattle graze there, and last year 60,000 head of sheep were pastured in the district. The water-grade road would pass through some good timber lands, and along its course scenic conditions are excellent. The river and its tributaries abound in fish. Central Idaho has produced in round numbers $150,000,000 in gold from its placer mines. Under modern methods placer mining has some good districts to be developed. For several years quartz mining has been carried on in the face of great handicaps created by the lack of transportation, but notwithstanding that there are at least 50 gold mines in the district having a good deal of development, and many of them equipped with mills. Some have a depth of 500 ft. or more with ore in quantity and quality which precludes any question as to their merit. There are also prospects, good, bad, and indifferent galore. Much of this work has been done in the last five years. The entire territory lies in the National Forest Reserve, which Department is trying to attract homesteaders. The lack of a general understanding by the public of the Forest Reserve law is being removed. . . .”

Porthill.—Lessees (Klockmann brothers) of the Idaho-Continental lead-silver mine near here paid the company $173,283 in royalties during the past 2½ years. The lessees spent $248,699 on improvements, and were credited with this sum on royalty account. There was mined 12,579 tons of ore during the period, and the mill worked 560 full days out of 892 possible. The orebody has been proved for 1450 ft. in length, and reserves are now 250,000 tons, an increase of 100,000 tons. No profit has been drawn by the lessees so far, and owing to the low price of lead they will either have to close the mine or have a reduction in the royalty, which is 30% of smelter returns. The new aerial tram across the river was recently completed. James Wilson is superintendent.

Wallace.—Tamarack & Custer shareholders were to decide on acquiring control of the Sherman Lead Co. on February 26. A 51% interest will cost $150,000. The purchase would give T. & C. two claims and fractions containing a large orebody, also 4000 tons of ore on dumps. A 49% interest in the Sherman is held by James F. Callahan, Charles McKinnis, Harry R. Allen, Alex Swan, Ed. Doyle of Denver, and Mrs. James Leonard. The chief holders of the Tamarack & Custer are the Day brothers of Wallace.

The Sunshine Mining Company has taken over the Sunset-Banner Mining Co.'s six claims, making a compact group of twenty on Beaver creek. The deal was on a share basis. Tunnels have been driven, No. 5 being in 1100 ft. D. L. McGrath is president and manager.

The Consolidated Interstate-Callahan is to move its main office from New York to Wallace. According to the president, J. A. Percival, the mine is in fine condition.

KANSAS

Baxter Springs.—The Federal Mining & Smelting Co., a subsidiary of the A. S. & R. Co., is operating the Lucky O. K. mine, just north of Hockerville, Oklahoma. A mill is working one shift. P. W. George is manager.

The Delaware Zinc Co. put down 30 drill-holes west of this place, none of them recording blanks. Ore in some was cut at a depth of 55 ft., the face being 45 ft. deep, of good grade.

MICHIGAN

Houghton.—So far no labor agitators have turned up in the Copper Country, consequently there is no talk of strikes. The local smelters continue to pile up copper, as is usual during the winter.

The Copper Range company pays $1 per share on March 15. This is a reduction of 50 cents per quarter.

Production of the Calumet & Hecla group was as follows in January: Ahmeek, 1,928,305 lb.; Allouez, 486,708 lb., C. & H., 5,588,051 lb.; Isle Royale, 1,514,220 lb.; Osceola, 1,405,898 lb.; and White Pine, 404,000 pounds.

MISSOURI

Annapolis.—The Annapolis Lead Co. has been organized with a capital of $2,500,000, head office at St. Louis, to develop holdings in Iron county. It is said that $50,000 has already been spent in exploration. F. M. Strickland and J. A. Nolan are largely interested.

Joplin.—Production of the Tri-State region last week was as under.

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	1708	..	328	$88,582
Missouri	1390	32	238	70,274
Oklahoma	4146	..	510	195,996
Average price	$41	$28	$51	

The total value is a decrease of $170,135 when compared with the previous week.

MONTANA

Anaconda.—The Washoe Reduction Works is operating at 60% of capacity. Only the concentrating section was stopped during the labor troubles at Butte.

Butte.—Mining companies here are reported to have decided to employ only Americans or those that have declared their intention of becoming citizens. This resulted in a rush to take out naturalization papers last week.

Concerning the Butte Central Mining & Milling Co., controlled by the Butte-Detroit Copper & Zinc Co., a circular dated at Boston, December 14, 1918, says in part, the bonds of this company, which amount to $300,000, have been defaulted by non-payment of interest. The value of the mine has not been thoroughly established but it seems clear that the personal property must be worth $100,000, and that the real estate has important value in connection with adjoining mining property, the owner of which can use the shaft and other property, should be worth upward of $100,000—a total of more than $200,000, outside of any value which it may have as a mine. From this sum the old underlying attachment on the real estate (aggregating with some other charges about $65,000) would have to be deducted in estimating the present value of the bonds, and the $80,000 of bonds pledged should be deducted from the total of bonds to be liquidated. It is thought by many that the property has great value as a mine.

Davis-Daly reports for the last quarter of 1918 a net profit of $129,936, an increase of $20,000 compared with the previous term. There was smelted 15,191 tons of 7.80% ore, yielding 2,432,010 lb. of copper and 100,050 oz. of silver. Quick assets on December totaled $503,660. The 2100-ft. level was opened during the term, a fine orebody being exposed. Improvement in ventilation continues. Production is to be curtailed on account of the market. M. W. Atwater is now general manager. Davis-Daly produced 1,018,889 lb. of copper and 39,093 oz. of silver in January, a gain of 40,000 pounds.

NEVADA

Austin.—Ground-water in the Reese River basin and adjacent parts of Humboldt River basin is discussed by G. A. Waring in Water-Supply Paper 425-D of the U. S. Geological Survey. The climate of the area is arid, annual rainfall at Battle Mountain being 7 and at Austin 12 inches. Between these two places is a railway 103 miles long. The water from dug wells in the region contains more of the alkalies and less calcium and magnesium than water not concentrated by evaporation and transpiration, the processes at work here. The water from springs are not so highly mineralized as those from wells. Water from drilled wells is only fair for domestic use, and could not be used satisfactorily in boilers. Austin is supplied by a spring.

VIEW SHOWING EXTENT OF OLD WORKINGS AT AUSTIN, NEVADA

Carson.—A bill prohibiting aliens from locating or holding mining claims in Nevada has been introduced to the State Legislature by Senator Chandler. The measure specifies that only American citizens may locate or hold mineral lands.

Eureka.—The Eureka district seems to be taking on new life, and the following items may be of interest:

J. S. Bagg has begun development on the Silver Connor group, four miles south-west of Eureka on Prospect mountain. The property has a tunnel 2300 ft. long that cuts the orebodies at a depth of over 800 ft. A gasoline compressor will be installed. This mine was worked in the early days when water for the hoist had to be carried on horses at a cost of 25 cents per gallon.

D. States, manager for the Nevada Eureka Mining Co., has opened a large body of shipping ore on the Licid Tufa property, also has several lessees in the different parts of the mine, all extracting shipping ore. This class of ore assays better than $25, generally from $40 to $60 per ton.

The Hope Consolidated company of Ruby hill has been driving a tunnel several hundred feet long, and is now in promising ground.

Charles Wittenburg of Tonopah, owner of the Cyanide mine on Adams hill, has purchased a new compressor and machinery, and will soon begin operations.

Charles Mau is opening a promising prospect in Newark valley, near the old Bay State mine, 20 miles north-east of Eureka.

Mason.—In Professional Paper 114, of 68 pages, of the U. S. Geological Survey, by Adolph Knopf, the geology and ore deposits of the Yerington district are discussed. An abstract of this will be published at a later date. From 1912 to the end of 1917 the copper output of the region totaled 61,200,000 lb. The average tenor of the ores has ranged from 2.75 to 6.00%. All of the mines are described, and numerous illustrations are given.

The Bluestone Mining & Smelting Co.'s flotation plant stopped work indefinitely on February 19, while the mine and other operations will cease on March 1. A general clean up has been made, so everything will be left in good order for resumption. With the shutting down of the smelter at Thompson there remained no outlet for the oxide ore. Plans had been made for another unit to the mill, and it is generally understood that this will be built before commencing milling again. The K & K machine recently put in did good work.

Rochester.—The Rochester Nevada Silver Mining Co. was finally organized this week. Full details will be given next week.

Thompson.—The Mason Valley Copper Co. produced 1,100,000 lb. in January, a decrease of 160,000 pounds.

The company's smelter is expected to suspend work at any time.

Tonopah.—Production of the district last week totaled 7130 tons of ore valued at $121,210.

The Jim Butler, from 905 tons, made a profit of $5900.

At the West End last week fire damaged the engine-house to the extent of $20,000.

NEW JERSEY

Franklin Furnace.—The New Jersey Zinc Co. in the last quarter of 1918 reports a net surplus of $2,313,969, compared with $3,926,428 a year ago, and $7,297,051 in 1916. A dividend of $1,400,000 left a balance of $913,969.

NEW MEXICO

Pinos Altos.—The Calumet-New Mexico company has nearly finished its 50 to 125-ton concentrating plant at this place. The zinc-copper-gold-silver ore is refractory, and needs careful treatment.

OKLAHOMA

Picher.—Owing to the hoist getting beyond control, four men at the Picher company's No. 9 mine were dropped 270 ft. on February 14. About 40 ft. from the bottom of the shaft the hoist-man regained control, but a brake bolt broke, and although the fall was partly broken the bucket struck the bottom. Injuries received were serious but not fatal.

TEXAS

El Paso.—The A. S. & R. smelter here has reduced wages by 50 cents for those receiving $2.50 or more, those between $2.50 and $2 will get $2, and laborers getting $2 will be paid $1.75.

UTAH

Bingham.—The Bingham Amalgamated Copper Co. is succeeded by the United Bingham Mining Co., with a capital of 1,000,000 shares.

Dugway.—The Metal States Mining & Milling Co. has been organized with a capital of $100,000 to develop copper-gold claims in this district. J. F. Cannon of Salt Lake City is president. E. S. Fisher is secretary, also engineer and geologist.

Oasis.—The old Detroit Copper Mining Co., which has a lease on the Ibex Gold Mining Co.'s property in Millard county, about 35 miles north-east of this place on the Salt Lake Route, was reorganized at Salt Lake City last week. Joshua Greenwood is president. The ore carries gold and copper, dumps being valued at $300,000.

Park City.—The Three Kings mine has been examined by E. L. Zalinski. The shaft is down 700 ft., and at 500 ft. a cross-cut entered ore-bearing limestone and quartzite. Samples assay 3% lead and 4 oz. silver per ton. Further work is recommended in the Ontario limestone, where is the No. 4 fissure.

Tintic.—Wages were reduced by $1 per shift at the Mammoth mine last week, the forerunner of a general cut of 75 cents.

The Tintic Paymaster Mines Co. has been incorporated with a capital of 2,000,000 shares, 50 cents par. W. I. Snyder is president, and William Knight vice-president. The property is a consolidation of 1700 acres. A fair amount of exploration has already been done.

WASHINGTON

Leadpoint.—The Electric Point company has suspended operations for the present on account of the lead market. Tests are to be made on concentration of the carbonate ore; if successful, a mill is to be built. The surplus at the end of 1918 was $175,000.

Northport.—It is reliably stated that the smelter here is to close indefinitely at an early date.

Spokane.—The annual mining convention, which is usually held here in February, but which was postponed owing to influenza, has been definitely abandoned; and Spokane will do what it can to make the Vancouver and Nelson meetings successful. Vancouver's first convention will be held March 17, 18, and 19. The Nelson convention will be held some time in June, when the Kootenay country is at its best.

CANADA

British Columbia

Anyox.—The British Columbian Legislature has before it a petition relative to the 18-mile railway that has been constructed from Alice Arm nearly to the Dolly Varden mine. This is of special interest in view of the recent announcement that the Temiskaming Mining Co. has secured possession of the Dolly Varden and Wolf silver mines. The petition sets out that the Taylor Engineering Co. spent $425,000 on the line, almost completing it, without being repaid by the owners of Dolly Varden.

Sandon.—The Roseberry Surprise mill is closed, and the ore treated there will be sent to the Roseberry mill. To Sandon this is a decided set-back, as it constituted one of its chief industries and employed a large number of residents, mostly men with families, who will be without work.

Invermere.—Snowslides have caused some trouble and not a little damage so far in this district. The Paradise Mines road was blocked for several days by a slide. On December 4 a slide at the Lead Queen carried down the foreman and a miner. The former was dug out from 10 ft. of snow after being buried two hours; he was uninjured. The miner has not been found. On the morning of January 19 a slide carried away the tram and the tunnel-house at the Trojan mine; no one was injured and the damage was nominal. The tram will be repaired at once, and will be in operation again shortly.

The Sitting Bull Mining Co. has built 8 miles of wagon-road up Boulder creek at a cost of $15,000. This enables it and others to get ore out and necessary supplies in. The Sitting Bull has 90 tons of ore sacked that will average 132 oz. silver and 29% lead. The orebody is opened on 5 levels, and a tunnel will be driven this spring to cut the shoots at depth. E. D. Smith is superintendent.

The Trojan Copper Mines Corporation on Boulder creek has erected a 3-drill Ingersoll-Rand compressor, and a jig-back tram across the creek to the ore-bunkers. High-grade copper ore is being hauled to rail at Athalmer. The ore is chiefly chalcopyrite in a quartz gangue, averaging 20% copper, 6 oz. silver, and from 50 cents to $2 gold per ton. There is about 600 tons of shipping ore on the dump. A raise from No. 2 to No. 1 level shows 7 ft. of rich ore. There is from 18 to 25 in. of concentrating ore carrying from 4 to 6% copper and some precious metals. The company expects to erect a 50-ton mill during 1919. E. D. Smith is superintendent.

The Paradise Mines Co. on Toba creek has driven a raise from No. 4 to No. 3 level, and is constructing a surface 3-rail jig-back tram, and in future will work the mine through No. 4 level. The ore is a carbonate, and occurs as chamber deposits in a crushed zone, it evidently being a replacement of the crushed areas in the limestone. Several teams are hauling ore to rail at Invermere.

The Lead Queen on No. 2 creek was bonded to Seattle people, who took out two carloads of ore during November, but it has been shut-down since December 4. Mr. Denhart, the manager, is expected back from Seattle, and it is reported work will be resumed soon.

Kimberly.—At the Consolidated M. & S. Co.'s Sullivan zinc-lead mine the two-mile tunnel has reached ore. The output in the last 10 days of January was 4690 tons of zinc and 1405 tons of lead ore.

Princeton.—The Canada Copper Corporation finished laying track from Princeton to the millsite at Allenby on January 31. A spur will next be laid to the mine. Machinery can now be hauled to the 2000-ton mill, the building of which will be ready for the equipment.

Stewart.—The Missouri gold-silver-copper-lead mine at the head of Portland canal has been re-purchased by Sir Donald Mann. Diamond-drilling is to be undertaken. The new owner formerly had an option in 1910.

Vancouver.—The Vancouver Chamber of Mines has decided to change its title to that of the British Columbia Chamber of Mines. This step has been decided in order that the influence of the organization may be extended to include the whole Province. At the last election of officers a selection was made of some representative mining men outside of Vancouver, it being felt that, if the Chamber of Mines is to make its work beneficial to the industry, it must be understood to be a body belonging, not to any particular locality or community, but to the whole of the Province. Good progress is being made in preparations for the International Mining Convention to be held in March.

Manitoba

Resources and characteristics of northern Manitoba are further described in the February 'Granby News', published by the Granby Consolidated of British Columbia, by C. M. Campbell. In this illustrated article the rivers and railway are covered.

The Pas.—A reconnaissance of the proposed railway from The Pas to the copper fields of Flin Flon, Schist, and Athapapuskow lakes has been made by J. P. Gordon, whose report has been submitted to the authorities. The main line is about 75 miles long.

Ontario

Cobalt.—The Nipissing mills treated 178 tons of ore for $106,586 and 5959 tons for $121,350, in January, a total of $227,936.

The Wettlaufer Lorrain Silver Mines company during 1918 leased its mine to the Pittsburgh Lorrain Syndicate, which paid royalties totaling $2209. No important developments were recorded. The surplus on January 1, 1919, was $103,342.

Haileybury.—The ore-dressing laboratory of the Haileybury School of Mines is in operation, in charge of D. A. Mutch of the Coniagas mine. The school board consists of F. D. Reid of the Coniagas, J. J. Denny of the Nipissing, M. F. Fairlie of the Mining Corporation, and E. A. Collins, formerly mining inspector here. The plant is well arranged.

including jaw-crusher, 3 stamps, amalgamating plate, classifiers, tube-mill, concentrators, agitators, thickeners, and flotation apparatus; also assay-office. According to the Cobalt 'Nugget', seven processes may be used on ores, namely: (1) Straight gravity concentration test, by crushing to the desired size in stamp-battery and tube-mill and concentrating the crushed product on jigs and tables. (2) Combination of concentration, followed by cyanidation. (3) Straight cyanidation in which provision is made for all-sliming and agitating process, or leaching the sand and agitating the slime. Provision is also made to precipitate precious metals from the solution by sodium sulphide, zinc-dust, or aluminum dust. (5) Amalgamation followed by concentration. (6) Amalgamation followed by cyanidation. (7) Amalgamation followed by a combination of concentration, cyanidation, or flotation. This school is contiguous to Cobalt, Porcupine, Gowganda, Kirkland Lake, and other centres.

Kirkland Lake.—The Kirkland Lake Proprietary late in January issued the following circular to shareholders: The directors announce that a scheme of amalgamation and absorption by the Kirkland Lake Proprietary, Ltd., of the properties and assets of the Tough Oakes Gold Mines, Ltd., Burnside Gold Mines, Ltd., Sylvanite Gold Mines, Ltd., Sudbury Syndicate, Ltd., and an important Cobalt company, has now been provisionally agreed. It is subject to the confirmation of their respective valuations by H. H. Johnson, consulting engineer for the Kirkland Lake Proprietary, and will only be submitted to the shareholders of the various companies for approval after his report has been received. Mr. Johnson was expected to arrive in Canada during February, and the detailed proposals should be ready for the consideration of shareholders some time in March. The amalgamation, as previously agreed, should prove advantageous to all the mining companies concerned, as well as to the Kirkland Lake Proprietary, which holds a controlling interest in most of them, as well as a considerable area of further claims. The absorbing company will own a continuous and compact block of claims aggregating over 600 acres in extent, situated in the centre of the Kirkland Lake goldfield, and it is believed that the results already obtained at several points on the various properties warrant the erection of a large central installation, which will ensure quicker and more effective development, with much lower working costs than have hitherto been possible. Active operations are in progress on the Cobalt property and good developments are reported.

The Teck Hughes mill treated 2459 tons of $8.62 gold ore during January.

Porcupine.—The Hollinger Consolidated in 1918 treated 578,755 tons of ore, yielding gold worth $5,752,370. In 1917 the output was $4,261,938, and $5,073,401 in 1916. Ore-reserves are valued at $41,080,005, a slight decrease. The Hollinger pays a dividend of 5 cents per share on February 25, equal to $246,000.

The Schumacher mine is expected to resume milling shortly, after being closed since July last.

MEXICO

Chihuahua

Chihuahua.—According to arrivals at El Paso, Texas, on account of raids and threats by bandits, the A. S. & R. and other mining companies may shut-down their properties. Both Carranza and Villa's men are collecting taxes, and the companies refuse to pay this.

Sonora

Cananea.—Greene-Cananea in January produced 3,000,000 lb. of copper and 106,480 oz. of silver, a decrease of 2,100,000 lb. and 68,000 oz. when compared with December. For 1918 the total was 53,270,000 lb. and 1,549,672 ounces.

PERSONAL

Note.—The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

Frederick G. Cottrell and **George S. Rice** sailed for France on February 22.

L. A. Cummins, mining and electrical engineer, has gone to Yokohama, Japan.

Jasper T. Robertson has opened an engineering office in the Hobart building, San Francisco.

Errol MacBoyle has moved his offices from the Crocker building to the Hobart building, San Francisco.

M. J. Conover, manager of the Valley View mine at Lincoln, California, was in San Francisco last week.

S. E. Bretherton, Jr., has returned from Burma and is occupying offices in the Mills building, San Francisco.

B. C. Austin and **Walter V. Wilson** have opened an engineering office in the Santa Marina building, San Francisco.

Sydney J. Jennings has gone to Mexico City to confer with the Mexican division of the A. I. M. E. regarding problems of mining engineers in that country.

Charles F. Williams, formerly with the Tonopah Belmont Development Co., who has been in France for over a year with the 30th Engineers, has received his discharge.

William Brandt and **F. A. Voorhees** are returning to the Baeis G. & S. M. Co.'s property in Durango, Mexico, by way of Mazatlan, Sinaloa. The works have been shut-down for six years.

George H. Parsons has received his discharge from the Gas Defense Service, and has returned to his position as chief chemist for the Ray Consolidated Copper Co. at Hayden, Arizona.

John R. Van Fleet, who was with the California Chrome Co. in San Luis Obispo county, California, has been in the Black Lake chrome district of Quebec, and is now at Niagara Falls, New York.

Chester Naramore, who succeeded **W. A. Williams** as chief petroleum technologist, Bureau of Mines, has resigned from the Bureau to engage in commercial work. **J. O. Lewis**, superintendent of the Petroleum Station of the Bureau of Mines, at Bartlesville, Oklahoma, has been appointed to fill Mr. Naramore's position, and **W. P. Dykema**, petroleum engineer, has been appointed as superintendent of the Petroleum Station to succeed Mr. Lewis.

G. S. Crouse, general foreman of the McDougall furnace department at the Anaconda company's Great Falls plant, died of pneumonia recently. He had been employed at the plant for 24 years.

The International Mining Convention will be held at Vancouver, B. C., on March 17, 18, and 19. The Chamber of Mines is making arrangements.

The annual meeting of the Colorado Section of the A. I. M. E. was held at Denver on February 8, 53 members attending the dinner. The following were elected officers: Chairman, R. J. Grant; vice-chairman, W. H. Leonard; secretary-treasurer, Robert M. Keeney; and executive committee, S. I. Ionides and Robert Hursh.

The California Chapter of the American Mining Congress held its first meeting on February 13 in the offices of the California Metal Producers' Association, Merchants' National Bank building, and elected the following officers: George W. Starr, governor; Albert Burch, first vice-governor; L. P. St. Clair, second vice-governor; K. R. Kingsbury, third vice-governor; P. C. Knapp, secretary.

THE METAL MARKET

METAL PRICES

San Francisco, February 18

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	17.00
Lead, pig, cents per pound	5.35— 6.35
Platinum, per ounce	$100
Quicksilver, per flask of 75 lb.	$85
Spelter, cents per pound	9.00
Zinc-dust, cents per pound	15.00

The Union Trust Co. of Pittsburgh has purchased from the Aluminum Company of America $12,000,000 6% serial notes. Heavy inventories and expansion program necessitated this financing.

ORES

Monthly reports on minerals investigations are now being issued by the U. S. Bureau of Mines at Washington. In the first issue are given the names of the minerals and the officer in charge of the respective work. The following subjects are briefly covered: tin, cost-keeping methods for small mines, pyrite and sulphur, tungsten, political and commercial control of minerals, iron ores, copper, gold, silver, magnesite, potash, chalk, stone, manganese, chrome, lead, zinc, antimony, and graphite. The report covers 30 pages. All interested in these minerals should arrange to get copies of these regular bulletins.

Concentration of domestic low-grade manganese ore is the subject of War Minerals Investigations Series No. 9 of the Bureau of Mines, by Edmund Newton. The deposits, ores, requirements of the steel industry, mining and marketing, factors affecting treatment, methods, and costs are discussed.

EASTERN METAL MARKET

(By wire from New York)

February 25.—Copper is inactive and lower. Lead is quiet but firm., Spelter is dull though steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price(as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾, on December 13 to 48 7/16, and in February to 47¾ pence.

Writing on January 30, Samuel Montagu & Co. of London said that no change had taken place in the price of silver, but one might occur at any moment on account of reduced freights from America to England. The text above the price table shows that this took place in February. On the editorial pages will be found a brief summary of the silver position.

COPPER

The lead market at St. Louis has been dull and lower, according to the 'American Metal Market,' as despite the attempts of some of the producers to sustain prices there is enough re-selling to keep the market on a downward course. The production is still restricted, but lead is coming out from unexpected sources, and the demand is so limited that a small amount offered is sufficient to cause a decline. The Desloge Lead Co. is refusing to quote a price, but buyers appear to find no difficulty in securing enough lead for their requirements. There have been sales at 4.60 cents.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71¼c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

The Price Fixing Committee of the War Industries Board terminates its duties on March 1.

Eastern Metal Market

New York, February 19

The markets are all inactive and featureless, although the tendency in some is to be firmer.

Antimony is unchanged.

Copper continues to decline on sales of small tonnage.

Lead is more active, with quotations firm.

Tin is still restricted by governmental control and is stagnant.

Zinc is extremely quiet, but fairly firm.

ALUMINUM

No. 1 virgin aluminum is obtainable now at 31 to 32c. per lb., New York, for early delivery. The maximum Government prices continues in force until March 1, but are nominal and of little significance. They are 33 to 33.20c. per lb. in 50-ton to 1-ton lots.

ANTIMONY

The market is flat and featureless. For early delivery, wholesale lots are obtainable at 7.12½ to 7.25c., duty paid, New York, but demand is light.

COPPER

The market continues to fall, but sales are still of small proportion and insignificant, judged by normal trading. While fair sales have been made for such times as these, the quantities involved would not be regarded as enough to fairly judge the market when conditions are normal. Production continues to be curtailed, and there is no doubt that it is considerably below normal or what it was before the War. The quotation today for electrolytic copper is 17c. per lb., New York, for early delivery, and it is said by some that this could be shaded. Sales of small lots have been made, largely by small producers or second-hands in the last week on a scale down from 18c. until today the metal can be bought at or under the 17c. level. Lake copper is largely nominal at 17.50c., New York, with demand light. The market as a whole may be termed stagnant, with buyers holding off as much as possible. Casting copper is quoted at 16.25 to 16.75c., depending on delivery. The London market has been declining, and is now about £90 for spot and £84 per ton for future electrolytic.

IRON AND STEEL

The situation in the iron and steel trade is better than it was a month ago, only in that there are 30 less days to wait for revised buying, says 'The Iron Age'. Business is almost wholly for necessities. By the end of this week the machinery of the Government price investigating board will be under way, but there is some doubt as to what are by this medium to be regarded as fair prices. The downward marking of prices is proceeding naturally, but it is generally confined to quotations and not to actual transactions. Inquiry for export is in better volume, but high shipping costs retard business in this direction. England had lost a tin-plate order to this country at $18.55 c.i.f. Lisbon, which compares with a base price here of $7.35 per box.

LEAD

Inquiry has been much better during the past week, in fact it may be regarded as having been nearly widespread. It is felt by many that the present quotation of both the leading interest and the outside market of 5c., New York, or 4.70c., St. Louis, which has remained firm for nearly two weeks, is bottom, and that an upward turn is near. The American Smelting & Refining Co. is said to be taking most of the business now going at 5c. per lb., but total sales under 5c. by independents have not been large, though a few have been willing to shade this level. Lessening of output continues, and it is predicted by some that the leading interest will advance its quotation in the near future. [This was done late last week, an advance to 5.10 cents.]

TIN

The tin market continues to labor under the restriction of vital Government control, and there is not much encouragement in sight. The only possible satisfactory feature is the report that the War Trade Board has been refusing import licenses for Bolivian concentrates and ores since February 3. This would mean a shorter period of time in which to dispose of the allocated metal, especially if it were known how much raw material is in stock and en route. It is still impossible to import tin except through the United States Steel Products Co., and it is also therefore impossible to purchase for future shipment from the Far East despite the report that Straits tin can be bought at less than 47c. per lb. for that position. This contrasts with the fixed price of 72.50c. for Government allocated metal. Straits tin is still nominal at 72.50c., New York, with 99% American tin offered at about 67c. Receipts so far in February have been 615 tons at Pacific ports and 50 tons at Atlantic. Spot Straits in London is quoted at £212 per ton.

ZINC

The market is extremely quiet but firm at 6.35c., St. Louis, or 6.70c., New York, for prime Western for early delivery. Producers do not seem inclined to concede anything to buyers, as present prices are considered under cost of production in most if not all cases. Consumers also are not eager to buy except for immediate needs, and the slightly better inquiry mentioned last week has disappeared. It is believed by some that the bottom has been reached much the same as in lead.

ORES

Manganese Alloys: The market for ferro and spiegel continues quiet, though inquiry for small lots of both are more numerous than in the recent few weeks. The demand is for early delivery. Quotations for ferro range from $175 to $200 for early delivery with $225, delivered, asked by most domestic producers. Spiegel is nominal at about $60 delivered. The ferro output in January was 21,331 tons and spiegel 11,456 tons, according to the blast-furnace reports of 'The Iron Age'.

Molybdenum: Quotations are nominal at 85 to 90 cents per lb. of contained MoS_2, with inquiry reported as better.

Tungsten: The market is stagnant and the situation has not changed during the last week. It is understood that ferro has sold in small amounts at about $1.50 per pound of contained tungsten. This would mean $15 per unit in 60% concentrates for high-grade ore. One trade paper is quoting $14 to $16 per unit for high-grade ore with low grade at $12 to $14.

CONGRESS ACTS ON WAR-MINERALS RELIEF

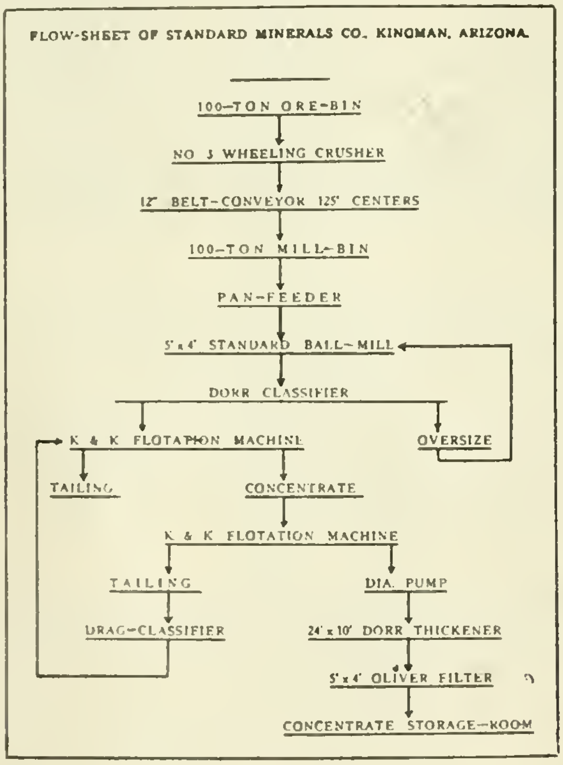
Just as we go to press a telegram from Washington brings the pleasing news that the House of Representatives has re-considered its action taken on February 14, and has voted to accept the Henderson amendment to the Informal War-Contracts bill for reimbursing producers of chrome, manganese, and other war minerals.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

CONCENTRATING MOLYBDENUM ORE

In the Hualpai mountains, south of Kingman, Arizona, the Standard Minerals Co., controlled by southern Californians, recently started its 50-ton mill treating molybdenum ore. According to the 'Bulletin' of the Chamber of Mines and Oil of Los Angeles, the process was devised by the resident engineer, R. L. Cornell, the design and erection of plant was done by the Wellman-Lewis Co., and the machino was supplied by Collins & Webb, all of Los Angeles. The accompanying flow-sheet shows the system of dressing the ore.



FLOW-SHEET OF STANDARD MINERALS CO. KINGMAN, ARIZONA.

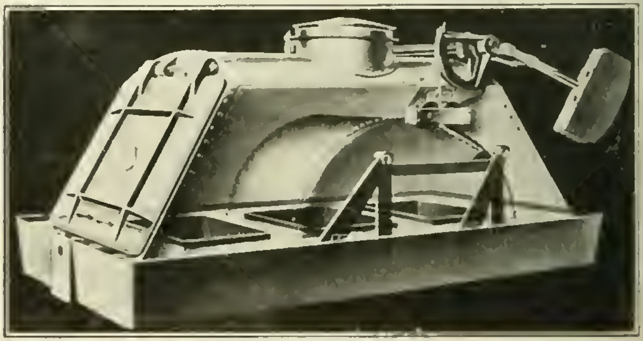
The mine is opened to a depth of 350 ft., and on the 200 and 300-ft. levels is said to be exposed a large quantity of ore assaying 1% MoS_2. At the shaft is a 45-ft. headframe, 40-hp. hoist, 80-hp. engine driving a 400-cu. ft. Ingersoll-Rand compressor, and a 25-hp. engine for the generator, pumps, and blower. All of the ore passes through a Vezin sampler, which takes a 1/20 cut. The mill is driven by a 120-hp. oil engine. All the gas engines were made by the Western Machinery Co. of Los Angeles. The company is fortunate enough to have a contract for its concentrate.

Officers of the Standard Minerals Co. are: G. M. Simpson, president; Dr. Lee C. Deming, vice-president; C. E. Holcomb, treasurer; and C. C. Randall, secretary. The main office is at Anaheim, California.

Catalogue 'B' of the Southwestern Engineering Co., of Los Angeles, is a handsomely-prepared 32-page publication on the K & K flotation machine. In a part list of companies using this apparatus is 67 names, operators in North, Central, and South America; also in Japan. The K & K has been so often described in this journal that it is unnecessary to do so again. Full details are given in the catalogue, including blue-prints and photos of parts; also reproductions of experimental reports, and various flow-sheets using flotation.

A NEW GAS REVERSING-VALVE

In the operation of any gas-fired furnace it is desirable that the valve controlling the direction of the flow of gas shall operate rapidly and easily. These factors have been kept in mind in designing this new gas reversing-valve, which has just been placed on the market by the Wellman-Seaver-Morgan Co. of Cleveland, Ohio. That the conditions have been ideally met is evidenced by the fact that a 36-in. hand-operated valve can be reversed in from 3 to 7½ seconds, with a pressure of not over 25 lb. This is accomplished by a perfectly balanced hood and counter-weights. An equally important feature is that, in this new design, the operating mechanism is outside of the casing where it is easily accessible and always cool. This new valve is similar in principle to the well-known Forter valve and is interchangeable as to ports and clearances.



NEW GAS REVERSING-VALVE.

The general design and construction of the W-S-M valve are clearly shown in the phantom view. It consists of an outer casing, a base with three ports, a hood to connect two ports, and the operating mechanism. The centre port is connected with the chimney. Waste gas from the furnace flows from whichever outside port the hood is covering to the chimney port. This leaves a clear passage for the fuel gas or the air entering the casing through the mushroom-valve at the top to pass through the third port to the furnace regenerator. Reversal of the flow of gas or air is accomplished by moving the hood to a position over the centre port and the one previously uncovered. The base of the valve is a cast-iron rectangular pan with three walled circular openings or ports. The hood that covers the centre and one end port is semi-elliptic in form, made of steel plates with angles at the bottom to support a fire-brick lining.

The base-pan holds a quantity of water so that when the hood is over the ports a water seal is formed to prevent the escape of gas. The base-pan has a tapped hole at each end for a water-pipe. There is a perforated strainer at the intake end, and a dam-plate at the other end to hold the water at such a level as to allow the hood to extend down into the water forming the seal.

The outer casing is made of steel plate and lined with fire-brick. It has cast-iron door-frames and door at each end through which the hood may be removed or inserted. Each door has a small peek-hole with a swinging cover which enables inspection at any time. On the top of the casing is a cast-iron neck which connects either with the fuel-gas flue or the air intake, depending upon the purpose for which the valve is used. The hood is moved by a series of levers and coupling-shafts, which extend through the water under the casing and into sockets on the hood. The shafts move on chilled-iron bearings. The operating mechanism is actuated by a hand lever.

With all hand-operated valves, a special stand is furnished, as well as six sheaves with hangers, clamps, and wire rope. At each side of the valve is a counter-weight attached to an arm and sector over which passes a chain connecting with the supports of the hood. The form of this sector is such that the counter-weights balance the weight of the hood at any position. The W-S-M valve has the following distinct advantages, the combination of which will be found in no other valve used for reversing the gases of melting or heating-furnaces.

The semi-elliptical form of the hood allows free flow of the gas, as there are no abrupt turns or constricted areas in the passage formed by the ports and hood. This feature is important in obtaining maximum efficiency from the stack draft. All leakage or waste of gas is prevented by the water-seal. Such a seal does away with all packing, tightening, and adjusting, the only attention required being the flow of a small quantity of water into the bed-plate to replace the amount evaporated. Due to its compactness, this valve requires comparatively little floor-space, and adapts itself to various arrangements of flues from the regenerator to the stack. The weight of the hood is counter-balanced by the weights of the lever-arm in such a way that the hood is in balance at any position, so to move the hood it is only necessary to exert enough force to overcome friction. This is an important feature in hand-operated valves.

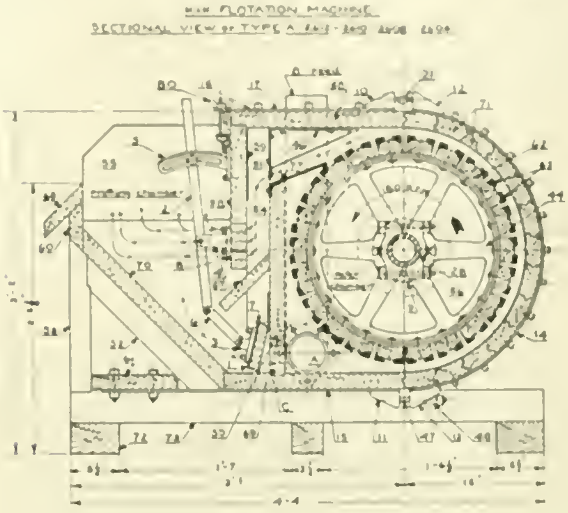
The materials used for each part of the valve are selected to give long life. The hood and casing are lined with fire-brick, and all working joints are protected from the hot gas. Bearings and wearing parts are designed with a high factor of safety. There are chilled bearings in the bed-plate for the rocker-arms and hardened links and pins on the hood supporting arms. Construction of the valve is such that all parts may be easily inspected and removed. The doors at each end of the outer casing are large enough to allow the hood to be removed. The reversing mechanism does not require the removal of bolts or nuts in placing or removing. The levers, links, and pins of the operating mechanism are on the outside, thus permitting oiling and adjustment, and ensuring long life and easy operation.

MOTOR-DRIVEN SHOVELS AND DRAG-LINE EQUIPMENT

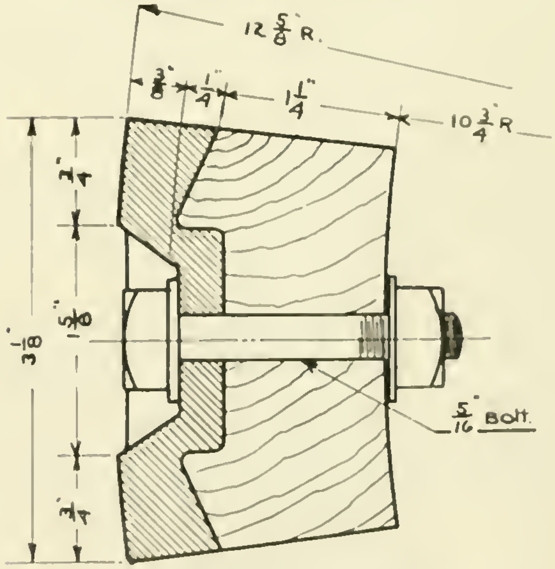
As a further means of economy and wherever electric power is available, electrically-driven shovels or drag-lines are used for stripping overburden, mining coal, excavating, dredging, re-loading coal and coke, making railroad cuts, and similar work. The advantages arising from the use of such machinery are as follows: lower operating cost, when fuels are scarce, expensive, and hard to transport; fewer operators are required; fuel is not an essential; there is no water to supply or freeze; no boiler or boiler troubles, no stand-by losses, no smoke, no sparks, no objectionable noises, and more material can be handled. A complete line of this equipment that meets the especially severe service encountered in such work, has been designed by the Westinghouse Electric & Mfg. Co. Simplicity is another feature of the apparatus tending to give it reliability in operation without skilled and frequent attention. Both alternating and direct-current equipments can be furnished, but the former is preferable because it is more economical.

CONSTRUCTION OF K & K FLOTATION MACHINES

All K & K flotation machines have a standard cross-section, the different sizes varying only in length. The standard construction is redwood and cast iron. It has been demonstrated that these materials will give long life with the most severe flotation feeds. All parts of the machine, subject to wear, are provided with cast-iron wearing-plates, which may be cheaply and quickly replaced. Wherever necessary, all parts are accurately machined and are interchangeable.



END SECTION OF K & K MACHINE.



DETAIL OF RIFFLE IN K & K MACHINE.

The riffle (part 63 shown on cut) has proved to be that part of the machine that receives the greatest wear. The maple riffle gives satisfaction in most cases, and is in general use where abrasive action is not severe. The cast riffle is designed to give long life where coarse or sharp feeds are used and is by far the most satisfactory wearing material for this class of work. Machines with wooden riffles can be fitted quickly with cast-iron riffles by simply removing the lagging carrying the wood riffle and replacing with lagging carrying the cast-iron riffles. All parts of the machine are accessible. By operating clamps 80 and turnbuckles 21, the top or cover of the housing, part 68, can be removed for inspection and replaced within a few minutes. For repairs to rotor, the circular back of the housing is easily and quickly removed by releasing turnbuckles 21 and 47.

The diameter of the rotor, which determines the size of the machine in cross-section, is the same for all types of machines, and was determined after experimenting to obtain the maximum aeration with the greatest efficiency. It is built on a $3\frac{7}{16}$ in. diameter hollow shaft of different weight and strength for the various sizes of machines. This shaft carries the cast-iron spiders 44, to which are attached the lagging 62 and riffles 63. The spiders have a split hub, and are securely fastened to the shaft by means of clamping-bolts and two heavy set-screws, which prevent slipping or movement on the shaft. Skimmer plate 77 is cast-iron made in convenient sections for assembling. Wearing plates 50 and 51 are either of cast-iron or of rubber belting, and give full protection to the wood partitions. The Southwestern Engineering Co. of Los Angeles makes this apparatus.

COMMERCIAL PARAGRAPHS

The Aspromet Co., of Pittsburgh, announces the opening of a sales office in the Schmulbach building, Wheeling, West Virginia, under the direction of E. A. Short.

The Hammond Iron Works of Warren, Pennsylvania, announces that George Armstrong has been appointed Pacific Coast representative, with offices in the Hobart building.

The Cling-Surface Co., Buffalo, New York, in more than 20 years of existence considers that it has done much toward conserving fuel and saving belts by eliminating belt-slip. It has made belt-slip and its attendant costs and troubles a special study, resulting in devising a formula for more accurately figuring slip costs.

J. J. Edwards, who for a number of years represented the Sullivan Machinery Co. in Mexico, and has recently been connected with the machinery and engineering material division of the supply department of the Government at Washington, is now manager of the rock-drill department of the Chicago Pneumatic Tool Company.

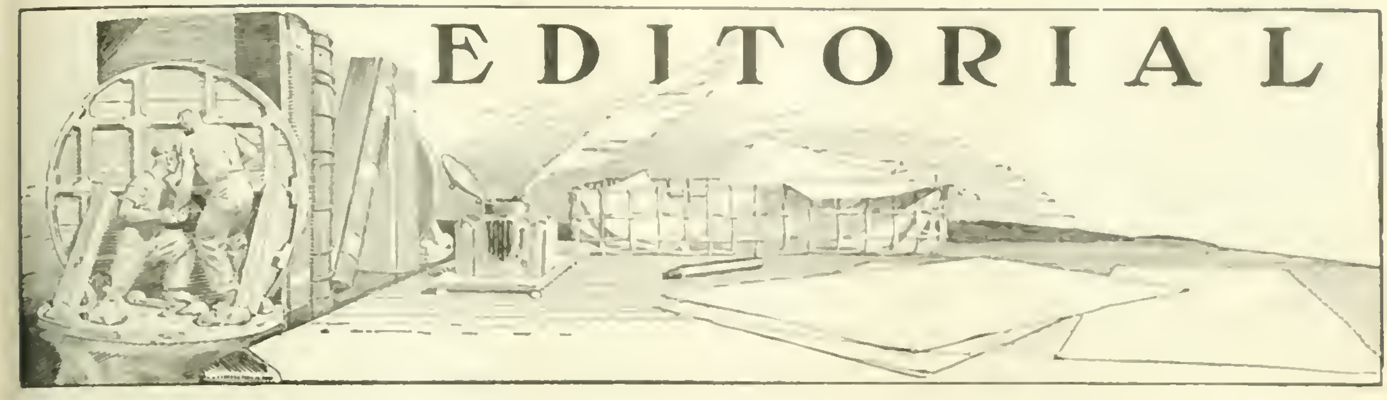
The All-Russian Central Union of Co-operative Societies, representing 30,000 societies containing 20,000,000 members, and which did a gross business of 700,000,000 rubles in 1918, has opened offices at 167 Post street, San Francisco, in charge of Alexander Zelenko. Manufacturers and producers in general desiring to engage in exporting to Russia and Siberia are requested to send in duplicate, catalogues, price-lists, and other information to the office of the Societies.

The Ingersoll-Rand Co. has published the following: Form No. 9120, on the Leyner oil furnace No. 3. No. 9010, on the Sergeant ticket-cancelling box, by railroads, toll bridges, ball grounds, race-tracks, lecture-halls, moving-picture theatres, etc. No. 9026, on Ingersoll-Rand high-speed piston-valve steam engine, class FP. No. 9123, on Imperial tie-tamping outfits. And No. 9028, on Ingersoll-Rand equipment for sugar factory and refineries, in English and Spanish.

The Liberty National Bank of New York announces that it has created an industrial department for the purpose of offering its services, in an advisory capacity, on matters pertaining to manufacturing and industrial problems. It has been the banks' observation in the past that there exists on the part of many manufacturers a distinct feeling that bankers, as a whole, have not appreciated their individual, technical, and commercial problems. This new work will be directed by Donald D. Davis, a man of practical engineering, accounting, and factory executive experience. It is the Bank's desire that customers avail themselves of such service. The department will be in a position to furnish, upon request, general information concerning the trend of industrial conditions, raw materials, labor, and all the other important influences to which a going concern is susceptible.

The Sullivan Machinery Co. of Chicago has published the following air-compressor bulletins: No. 75-D, 'Single-Stage Straight-Line Steam-Driven Compressors' (class WA-5); No. 75-E, 'Straight-Line Simple-Steam and Two-Stage Air-Compressors' (class WB-3; this is the familiar two-stage straight-line machine, which the firm has built for a number of years, but which has now been re-designed to incorporate the end-rolling finger or plate-type of valve, improved speed and pressure regulator and steam-valve motion, and other features); No. 75-G, 'Class WG-3 Single-Stage and Class WH-3 Two Stage Belt-Driven Compressor, Standard Pattern'; No. 75-I, 'Underground Mine Car Compressor' (class WK-2, complete with motor, electric fitting, and receiver for operating coal-pick machines, hammer-drills, etc., a popular type in quite general use, especially in coal mines); and No. 72-C, 'Sullivan Drill-Sharpening Machine of the All-Hammer Pattern'. This bulletin includes mention of the newly-designed Sullivan double arc-drill bits, which are fitted with double taper on the wing; together with the adjustable vertical-gauging dies in which this double taper-wing is made.

The Denver Engineering Works Co., of Denver, Colorado, reports that it has recently received orders for the reconstruction of 80 stamps at the Gold King Extension Mines Co. at Silverton, Colorado. W. Z. Kinney, general manager, has recently developed new orebodies in the mine and is now making extensive repairs at the old mill, machinery for which was furnished by this Denver firm several years ago. ——The original designer of the Gold King tailing plant was Frank E. Shepard, president of the Denver Engineering Works. One of the first steam-turbine electric-lighting generating plants was installed at the Gold King mill near Gladstone. These improvements at the Gold King Extension promise to greatly increase ore production of Silverton.——The firm also recently furnished ball-mills and other apparatus for the new mill of the United States Smelting, Refining & Mining Co. at Eureka, Colorado. This new mill was erected on the site of the old Sunnyside mill, which has been a prominent producer at Silverton for many years. ——A contract with the Chinese Ministry of War for a complete tungsten concentrating plant, including the crushing and concentrating machinery, as well as the complete detailed designs of the mill, was recently completed.——Among recent orders is one for a large electric hoist for the Compania Minera de Penoles, Mapimi, Mexico. One of the first electric hoists used in the republic was manufactured and installed by this company, and during these years the firm has enjoyed the continuous patronage of the Penoles company for electric hoists and smelting machinery.——Recent shipments also include crushing, concentrating, and mine timber-framing machinery for South America.——A Richards jig installation for the concentration of diamond-bearing gravel in South Africa was also furnished.——Another important Richards jig plant is for the concentrating of tin ores in South Dakota.——The firm is now constructing a large electric hoist of 25,000 lb. capacity for the Colorado Fuel & Iron Co. to be used in connection with its furnace plant at Pueblo.——A large number of Hardinge conical mills for distribution to Western mining districts are being built.



EDITORIAL

OUR compliments to Governor Boyle of Nevada for the spirit shown by him in vetoing the prize-fight bill. It took a mining engineer to show such political courage. Here we take the opportunity of correcting the impression that Mr. George ('Tex') Rickard is in any way connected with this paper; we may promote the belligerency of the pen but not that of the fist!

HORACE V. WINCHELL was elected president of the Institute at the 119th meeting, held in New York, on February 17. At the same time it was announced that the proposal to change the name to the American Institute of Mining and Metallurgical Engineers had been carried by the vote of the members. This will prevent 'M & M' being used as a 'short' for the Mining and Metallurgical Society of America—another wrong to Ireland!

EVERY time a Californian returns home from the transcontinental journey to the Atlantic coast he wonders why intelligent people live elsewhere. The sudden transition, in crossing the mountains that border this State, from a world dead in the grip of winter to the verdant foothills of the Sierra and the fruitful lands of the Sacramento valley is a marvel that is ever new and always joyful. What must it mean to our gallant soldiers at the end of the long and wearisome journey from Europe! We join with them in singing "I love you, California."

HOW difficult it is to obtain reliable information concerning the internal condition of Germany is indicated by two dispatches appearing in the same issue of the daily papers. An Associated Press dispatch states that a group of British officers, who had made a tour of inspection in order to ascertain the need for revictualing Germany, reported that "the country is living on its capital as regards food supplies, and that either famine or bolshevism—or both—will ensue before the next harvest if outside help is not forthcoming." On the other hand, an American correspondent asserts that "such privations as the Germans suffered during the War are rapidly disappearing and the German workmen, comparatively speaking, are prospering." The same writer says that "the Boche on the street believes he is not crushed and that economically Germany doesn't compare unfavorably with the Allies." Before long we shall get the truth, from Mr. Hoover.

BRITISH mining companies are getting rid of enemy-owned shares by arranging to buy those shares, now in the hands of the Public Trustee, who plays the useful part assigned in this country to the Alien Property Custodian. For example, the Consolidated Mines Selection Company, identified with the honored name of Mr. Walter McDermott, has purchased the enemy-owned shares in that company and now offers them to the non-enemy stockholders in the proportion of one 'enemy' share to every three shares already held, the price being the cost to the company after allowing for expenses incurred in the process of acquisition and transfer. After the non-enemy stockholders have had this opportunity to increase their holdings, any remaining 'enemy' shares will be allotted at the discretion of the directors to those making application for them.

MINING conventions are numerous at this season, largely because it is the time of the 'break up'—the melting of the snows and the approach of spring—a period during which mining operations, especially such as are surficial, are in temporary abeyance. We refer to the New York meeting of the American Institute on another page. Last week the Canadian Mining Institute held its annual meeting at Montreal, and we feel certain that under the leadership of its president, Mr. D. B. Dowling, and its efficient secretary, Mr. H. Mortimer-Lamb, the sessions were of unusual interest and usefulness. Coming nearer home, the Idaho Mining Association held its sixth annual meeting at Boise on February 11 and 12, under the presidency of our friend Mr. Stanly A. Easton, the manager for the Bunker Hill & Sullivan company. Several interesting papers were read, notably on 'Human Engineering' by Mr. E. H. Lindley, on 'The Physiography of Idaho' by Professor Douglas C. Livingston, on 'The School of Mines and the State' by Professor Francis A. Thomson, and on 'The Mining Industry of the Coeur d'Alene' by Mr. Walter C. Clark. We note that Mr. Jerome J. Day was elected president for the ensuing year. This association maintained a representative, namely, Mr. Ravenel Macbeth, its secretary, at Washington last year for the purpose of keeping in touch with Federal legislation, co-operating with other agencies of a similar character. Another important meeting is that of the International Northwest Mining Convention to be held at Vancouver on March 17 and the two following days under the auspices of the British Columbia Chamber of Mines. Mr. A. M. Whiteside is the president and Mr. William Sloan, Minister of Mines in the British Columbian government, is honorary president. This gathering, so near our frontier, of Canadian and American mine-operators and engineers promises to be interesting, and, like the meetings at New York and Montreal, will tend further to tighten the links of good-will between neighboring peoples.

NORTHCLIFFE'S retirement from the management of the London 'Times' is an event of international importance, even if we do not agree with Mr. George Harvey's high appraisement of Lord Northcliffe's services to Britain and to the Cause during the War. While this dynamic newspaper proprietor may have done signal patriotic service during the period of world crisis, we yet regard with dislike and fear the power he exercised by means of his string of publications. Superior as he may be in a hundred ways to Hearst, his ownership of so many mediums of publicity constitutes a danger to the development of the democratic idea in Britain and in the world at large. Hearst is a pestilence, Northcliffe is a menace.

RECENT and revised estimates of the War's holocaust awaken a feeling of horror even in minds calloused by familiarity with the stories of battle and sudden death. The 'Manchester Guardian', a newspaper of the highest character, states that 17,500,000 deaths were caused by the War. This excludes fatalities attributable indirectly to the War, but it does include a mortality of 4,000,000 due to the pneumonia and influenza provoked by war conditions. It is estimated that 4,000,000 Armenians, Syrians, Greeks, and Jews were massacred by the Turks, and that 1,000,000 Serbian civilians died through massacre, hunger, or disease. If justice is to be done, Turkey has yet to expiate her crimes. Her account is overdue. Another estimate, compiled by General March, at Washington, gives 7,354,000 as the total killed in battle or died of wounds. The losses of Russia and Germany are nearly equal, namely, 1,600,000. France comes next with 1,385,000, then Austria-Hungary and England with 750,000 each. These figures are below the official British estimate but they serve to indicate how great was the destruction of life caused by Germany's criminal ambition; she and her partners in the attempt to conquer Europe lost 2,750,000 lives, whereas the defenders of human liberty sacrificed 4,604,000 lives. The account is horribly ill balanced. Germany alone caused 3,250,000 deaths in the Allied armies, as against her total loss of 1,600,000. These figures show how much she gained by her preparedness for the attack and how much less she suffered than her victims. Shall she be given another and a better chance to carry out her fell designs?

The Institute Meeting

Those who attended the recent annual meeting of the Institute at New York will have taken home with them an impression of useful work sincerely performed. Light touches were not lacking, for instance, at the smoker and other entertainments provided by the New York members, but these were asides, which did not affect, in our opinion, the general purpose and the actual accomplishment. It seemed to us that the dominant note was one of seriousness, attributable mainly to the effects of the War and the realization of the complex problems facing all thoughtful citizens at this time. Another factor, to the older members at least, was the service in memory of Dr. Raymond, reminding them not only of the loss of a vivid personality long identified with the activities of the Institute but recalling also the recent loss of several other leaders of the passing generation, notably James Douglas and Anton Eilers. The presence of a delegation of Canadians representing the Mining Institute of the Dominion emphasized the good-will existing between the English-speaking peoples, more particularly our northern neighbors, and struck another note vibrating with the sentiment evoked by the War. Further cause for earnestness was furnished by realization of the fact that the Institute is no longer in undisputed possession of the field of usefulness to which it was dedicated 48 years ago. On the one side is a small and friendly, but assertive, rival, the Mining and Metallurgical Society of America; on the other such new organizations as the American Association of Engineers at Chicago and the Duluth Engineers Club, both aggressive and insistent in behalf of the welfare of the engineering profession. Moreover, the Engineering Council is doing work that has been delegated to it by the Institute and the other founder societies associated as tenants of the Engineering Building on 39th street, New York. The Institute no longer occupies the field undisputedly. Some measure of discontent prevails among all the engineering professions—mining, metallurgical, mechanical, chemical, electrical. This is due partly to the dislocation of industry incidental to the War and the sudden cessation of its major exertions, but it is also due in some measure to the failure of the engineering societies to fulfill all the functions demanded of them by modern conditions. We say this frankly because the leaders of our own profession, as represented by the directors of our Institute, are fully alive to the fact and are making a systematic effort to meet the exigencies of the time. The desire to promote solidarity by selecting the president annually from different parts of the country is evident. This year, for example, our president is a Western man, admirably fitted to represent those of us who live west of the Mississippi. Similarly the board of 25 directors is made regionally representative. In future it is hoped to give the 15 local sections direct representation by granting each section the opportunity every third year of nominating a director; and in order to make it practicable for the directors living far from New York to attend the board meetings it is proposed to set aside an allowance for traveling expenses, so that the selection of representatives will not be confined to men of wealth. In order to prevent this system becoming financially burdensome to the Institute it is expected that the more distant sections will choose men whose business takes them frequently to New York or even Western men temporarily resident in New York. All this indicates the desire to draw closer the bonds of fellowship and to remove even a suspicion that the Institute is dominated by a coterie in the East, as was the case, of course, when Dr. Raymond was in control. In those days the cost, in money and time, of a journey across the continent was an effective obstacle to any such plan of representation. Another recent development of social co-operation between engineers has been the joint meetings of local sections of the various branches of the profession. This feature of engineering activity has proved attractive in San Francisco, for example; it does not weaken the bond that ties each section to its headquarters, usually in New York, whereas it does promote general solidarity and incite the growth of sound ideas on matters vital to engineering as a comprehensive profession. Our readers are aware of the organization, at Chicago, of a society known as the American Association of Engineers. Mr. F. H. Newell was one of the principal promoters of it and we published his propaganda in our issue of October 16, 1915. This new departure is incited by the belief that the engineer's place in society is inadequately recognized, that he is under-paid, and that his scope as a citizen is too restricted. The aim is to establish employment agencies and fix rates of remuneration; also to emphasize the relation of the engineer to the Government and to the public; in short, something not only professional but occupational, something between a scientific society and a labor-union, has been created for the purpose of asserting the rights and dues of the engineer, under which term not only the manager and the consultant, the superintendent and the expert, but all the personnel of a highly diversified business are comprised. No liberal mind will be antagonized by such co-operative activity, least of all the members of our Institute. Here mention must be made of the Mining and Metallurgical Society, which has not been absorbed, as was hoped, by the Institute. This essentially New York organization of a group of men of the highest standing, all members also of the Institute, is disinclined to extinguish itself because it claims to afford a means of public utterance denied to the Institute and necessary to the profession. It is quite clear that this reaching forth for useful service on the part of other organizations does compel the Institute to take stock of its own performance and to consider gravely whether in any way it has been delinquent. We see no reason for dejection or disappointment, but ample cause for stimulation to further useful effort; and that is exactly the view taken by the directors of our Institute; they are facing the position resolutely and cheerfully. Much has been done already by co-operation with the Engineering Council, which is an upper house, as it were, of the engineering parliament and one well adapted by its selectively representative character to take action for the whole profession whenever required towards either the public or the Government. It seems to us that the conditions as we have outlined them call mainly for a further expression of loyalty on the part of our membership to the Institute and to the service for which it stands, it remains for the unofficial members to hold up the hands of the president and the directorate, assisting them both with cordial support and with helpful suggestion, in short, to take increased interest in all the activities of the Institute and thereby to further the best interests of our profession. Let us work together in time of peace with the spirit that we showed during war.

Relief for the Miner

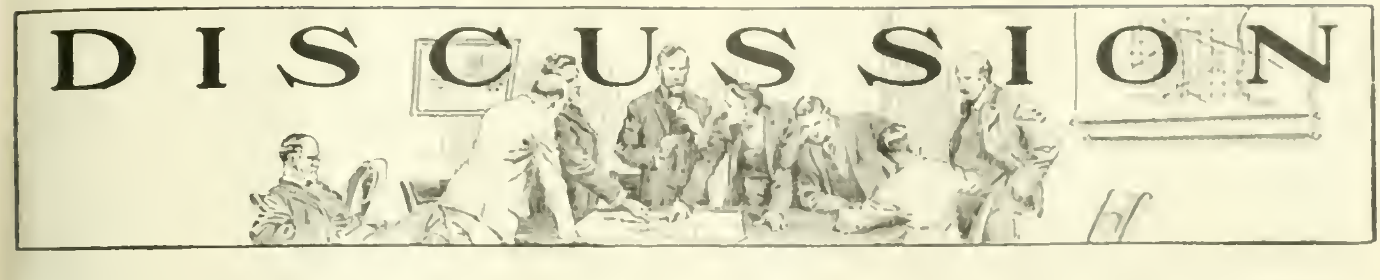
Nothing that the Government has done in recent months will produce so kindly a feeling among the miners of the West as the passage by Congress of the relief bill for the benefit of the producers of chrome, manganese, tungsten, and other war minerals. The effect will reach far beyond those immediately concerned in digging these emergency minerals, for what has been done to reimburse the producers of chrome, manganese, and tungsten is appreciated by the whole brotherhood of prospectors and miners. The Henderson bill, which finally became a greatly modified amendment to the Dent-Chamberlain Informal War-contracts bill, is a democratic measure, keeping faith with the host of small operators instead of being only for the benefit of the rich. It so happens that the men who responded to the call of the Government for a supply of these essentials minerals at a time of crisis were chiefly hard-working miners, men used to handling the pick and shovel in earning their daily bread; they were not of the alien class that so often disturbs the peace; they were real Americans, of the good old sort that made the nation strong in the pioneer days. It would have been a shame, a disgrace, a grave political mistake, to have denied honorable recognition of the right of such patriots to reimbursement of the losses they sustained, seeing that the Government was planning to re-pay the contractors who had done no more, and who, in most cases, had risked far less. It is amazing that men could be found who would oppose settlement of such just obligations, but in spite of such antagonism the Government's good faith has been sustained by the action of both branches of the national Legislature. At this writing the bill has not been signed by the President, but it is inconceivable that he would veto it, as it represents the wish of the Secretary of War in order to settle the obligations of his Department, and it is understood that the Dent bill had the President's cordial endorsement. [The Bill was signed on March 3.]

The full text of the bill will be printed next week. Meanwhile we are able to give a telegraphic summary, which shows that it authorizes the Secretary of the Interior to adjust, liquidate, and pay such net losses incurred by any person in producing or preparing to produce manganese, chrome, tungsten, and pyrite in compliance with the request or demand of the Department of the Interior, or the War-boards, to supply the urgent needs of the Nation in the prosecution of the War; the Secretary of the Interior to make such adjustments and payments as he shall determine to be just, and his decision will be final. The Act appropriates $8,500,000 for liquidation of claims arising within its jurisdiction, and all claims, in order to receive consideration, must be filed within the next three months. No claim will be paid unless the expenditure has been made in good faith for production on property containing mineral in such quantity as reasonably to seem to be 'commercial', and the money expended must have been applied during the War, that is, between April 6, 1917, and November 12, 1918. No profits on the money invested will be allowed, and business for purposes of speculation will be ruled out; moreover, if settlement is made on claims that subsequently prove to be fraudulent the Government is given the right and power to recover. In determining the net losses the value of any ore on hand and possible recovery from salvage of plant will be taken into account. The foregoing admits of reimbursement to everyone equitably entitled to it, so that the miners of these minerals may feel that they have received honorable treatment. The representatives of the people have not forgotten that the Government is operated for the good of the people, and not to play sharp tricks in getting something for nothing. The miners responded with what meant protection to their country, and now the country they helped to defend protects them from loss. Honors are even. The result that has been achieved has come from organization and intelligent direction of the propaganda for informing the officials in Washington of the facts. The first organization to have a representative on the ground was the Pacific Coast Chrome Producers Association, which, in conjunction with the Oregon Chrome Producers Association, asked Mr. Courtenay De Kalb to present their case at Washington. His services were contributed by the 'Mining and Scientific Press' in behalf of the mining industry. The foundation laid in Washington was broad and strong, and subsequently other organizations, under the auspices of the American Mining Congress, led to the creation of a War Minerals division of that body, which carried the fight to a finish. It was a notable achievement, for the time was brief and Congress was crowded with urgent business. The justice of the cause, the able advocacy of those in charge of the propaganda, and the sympathetic and efficient efforts of such men as Senators Chamberlain, Henderson, Johnson, and Poindexter, Mr. Julius Kahn, Mr. Nicholas J. Sinnott, Jr., and in fact the entire delegation from the West Coast States, Messrs. Otis Wingo, William A. Oldfield, William Schley Howard, and Edward S. Denison, who will probably be the next chairman of the House Mines Committee—all these, and many others, struggled from a high sense of duty to see that the Government made good in its moral obligation to the miners. The proper presentation of the claims is a matter of great importance. We understand that the Pacific Coast Chrome Producers Association will arrange to serve as a sort of clearing-house for such claims, giving advice and aid in putting them into shape for submission to the Department of the Interior. Information regarding these matters should be widely disseminated at once through the local papers in the mining districts in order to reach all legitimate claimants in time to enable them to take advantage of the relief now offered.

Mexican Concessions

Several weeks ago the State Department presented to Señor Carranza a demand for protection to the rights of American investors in Mexico. It was curt and direct, but the astute Coahuilense seated in the presidential chair found a clause in the document that served as a loophole. He had been asked, among other things, to protect American lives and property. It was easy to regard that as fundamental, so Carranza singled it out for reply. "Lift the embargo on arms and ammunition," was his plea, "and then I can maintain order." To the uninformed this would appear reasonable and just. Back of it is the black history of years of misrule in Mexico that has ruined the business of her own people and of those who have come from abroad to develop the resources of the southern republic. Of course, Carranza would rejoice to have the embargo lifted; he could then the more readily impose upon the industrious and respectable majority of the Mexicans, who are now powerless because unorganized and without leaders, the will of the petty minority that holds the reins of government. To accede to his request would be to sign the death-warrants of the real democrats that have stood by their constitutionalist principles, which means the constitution of 1857, the defence of which served Carranza as excuse for taking up arms against Huerta. Emboldened by his success in thwarting once more the effort of our Government to compel respect for American rights, he has started a new campaign for dispossessing the 'gringo' of his property in Mexico. This time it is the land concessions that are assailed. Under these grants great areas were being brought under irrigation and subdivided into small farms for sale to actual settlers. This was precisely in line with the spirit of the revolution, which was to give clear title to areas that were of a proper size for cultivation by individual owners. The order for revising land concessions cites examples in Chiapas, Lower California, and Quintana Roo, as if to divert attention from the more important concessions, judged on the basis of development done. A further point of interest is that the application of this principle would establish a precedent capable of being extended to concessions for water-rights, timber-lands, smelting, transportation, and other privileges of vital import to mining companies, which have continued to hope that the Mexican storm sometime might end, permitting the sun of prosperity once more to shine upon them.

DISCUSSION



Americanization

The Editor:

Sir—The Secretary of the Interior's views on this subject, as published in the MINING AND SCIENTIFIC PRESS of January 18, have given me the temerity to express a point I have considered for some time. Mr. Lane said: "All Americans must be taught to read, write, and think in one language." I would like to add: "and to do their banking business in the same language, namely, in English, the tongue of the United States."

The banks of this country have given freely a great service to the Nation during the War, and I suggest that they continue that service and extend it to include the teaching of Americanization. It is admitted that the habit of the immigrant of forming national communities is detrimental to his early Americanization, and I consider that some of the banks foster and encourage this community feeling.

In this I refer to the foreign named and hyphenated American banks. Among the large commercial banks of this country there are few offenders; but the fault is common with savings institutions. Right there a danger lies, because the immigrant seeks the savings bank at once. He looks among the list and finds the following: the Scandinavian-American Bank, the Italian-American Bank, the German-American Bank, the Hibernian-American Bank, the French-American Bank, the British-American Bank, and the Swiss-American Bank; and still more alluring and deceiving, the Bank of Italy. At one time, in Oakland, California, there was a Bank of Ireland and a Bank of Germany.

There is no good excuse for employing such national names, entirely out of keeping with their business, with no foreign national connection. The majority of our best banks use suitable titles. The only palpable reason that these banks do this is to attract the depositor who has a preference for one of these nations, and in so doing to cater to him as an Italian, German, Oriental, or other alien.

These banks do not even encourage the newcomer to learn English; they furnish tellers who speak his language. This sort of thing prevents the assimilation of the future citizen. With the genuine foreign banker it is entirely a different matter, and the two institutions must not be confused. Let the American banks use American names, and draw business because of the service given to their customers, thereby furthering Americanization.

DISCOUNT.

San Francisco, February 13.

Proposed Change in State Insurance

The Editor:

Sir—The Industrial Accident Commission is opposing the passage of Senate Bill No. 603 and Assembly Bill No. 791. These bills propose to take the State Compensation Insurance Fund from the management of the Commission and place it under the jurisdiction of other State officials.

The bills have been prepared and introduced by the private insurance companies, competitors of the State Fund. The employers have shown their confidence in the Fund by patronizing it in such large numbers that fully one-third of California's employers have policies with the Fund against the compensation risk. The employees are in favor of State insurance. The 'Reconstruction Program' of the American Federation of Labor opposes private insurance for profit in the domain of workmen's compensation and strongly advocates State monopoly.

There are excellent reasons why the Industrial Accident Commission should continue to direct the State Compensation Insurance Fund. Ever since January 1, 1914, the Fund has been under the actual management of expert insurance men, selected for their positions because of their ability. The outcome is a well-managed Fund, recognized as the most successful institution of its kind in the United States.

More than $790,000 has been returned in dividends to policy-holders, thus affording a striking example of mutual insurance under State auspices. The overhead expenses of the Fund are less than 13% of premiums, as against 40% for stock companies. The net surplus on January 1, 1919, was over $1,000,000. Over $2,000,000 of assets is invested in United States Liberty bonds and Californian municipal bonds, drawing interest for the benefit of policy-holders. California's employers have been saved an average of over 34% of compensation insurance cost for the years 1914 and 1915 (for which the reserve period has expired), and an initial refund averaging 15% is returned to policy-holders at the end of each year.

Equally important is the State Fund's relation to injured employees. Over $2,500,000 has been paid by the Fund for medical service and compensation to injured workers and their dependents. In addition, the Fund is holding a loss reserve of over $1,250,000 for death, permanent and continuing disability cases.

The State Compensation Insurance Fund's policy is liberal. Compensation is paid when morally due. Legal technicalities are avoided. For the fiscal year ended

June 30, 1918, there were 1086 contested cases referred to the Commission for decision, in which insurance carriers were involved. There are approximately 20 compensation insurance carriers in California. Though the State Fund is doing over one-third of the compensation business of the State, only 138 Fund cases were so referred, out of the total of 1086, and the Fund had 18,095 injuries reported during the fiscal year named. That record shows the attitude of the Fund toward claimants under the Commission's administration. The Commission carefully decided each Fund case, as it did each of the 948 contested cases in which the other insurance carriers were interested.

All State Funds in this country are operated by the State Industrial Accident Commissions. This enables these Commissions to so administer the State Funds that they will carry out the intent of compensation laws in setting an example for other insurance carriers in dealing with employers and employees, within the spirit, as well as the letter, of such laws. To divorce the State Fund from the Commission in California would interfere with this vital feature of administration. Not one instance of discrimination against private insurance carriers can be shown. There isn't a practical reason for the divorcement. The idea has been put forward by the avowed enemies of State insurance in California, and that alone should be sufficient to condemn the proposed legislation.

H. L. White, Secretary.

San Francisco, February 21.

Platinum and Government Red-Tape

The Editor:

Sir—Last fall an appeal was made through the public press to the people throughout the United States to surrender their platinum, as the Government was sorely in need of that metal. Being a chemist myself and knowing how essential platinum is in many chemical investigations, I felt that, under the circumstances, it would be unpatriotic to continue to wear a platinum and gold chain, from which a small platinum crucible might easily be made, so I packed up the chain, together with some scrap platinum I happened to have, and sent it to the United States Assay Office at New York, which was the department designated by the Director of the Mint to receive such material. I received an acknowledgement of the receipt of the platinum, dated November 7. A month later, as I had heard nothing further, and thinking a letter might have gone astray in the mail, I wrote to the Assay Office, inquiring if the work had been completed. I received a reply, dated December 16, stating that the work would be finished in about a week. Another notice, dated January 20, informed me that the assay had been completed and the necessary certificate had been forwarded to the Ordnance Department on January 14. A letter, dated January 22, was received from the Ordnance Department, giving the assay and value of the metal, and requesting that an enclosed receipt be signed, when payment would be made. This, though it did not seem to be exactly business, was duly signed and returned on the day it was received, January 28. Finally, a check, dated February 7, was received in settlement for the metal. Thus, it will be seen, it was exactly three months after the receipt of the platinum stock at the United States Assay Office that payment was made by the Ordnance Department.

Though the War, happily, is over, it is evident that platinum is still needed for post-war reconstruction, as appears from the fact that the price of the metal has risen since the Government removed the fixed price of $105 per ounce, but if the Government takes as long to refine the metal as it does to find out its value and settle for it—and it reasonably may be presumed that it takes longer—it is offering little encouragement to the people to contribute platinum, which is now used for ornamental purposes, for such post-war reconstruction.

Nevada Water Laws

The Editor:

Sir—I realize that we who are permitted to express our views in your columns are mere trespassers upon your space and the time and patience of your readers unless we deliver a message of integrity and service, and that, concerning the discussion between Mr. R. T. Walker and myself touching Nevada water adjudication as exemplified in a certain suit referred to by us, there is no question of general interest involved nor justification for appeal to the judgment and action of your readers, unless it is a fact that there is in Eldorado canyon, in southern Nevada, a continuous water-bearing fracture accompanying the porphyry dike that extends from the Colorado river 11 miles westward to the great mass of 'malpais', which, lying along the summit of the River range, is the only water reservoir of the region; that the water of this subterranean channel was first developed, used, appropriated, and filed upon, and granted by the State to the plaintiff company in the suit mentioned; that the defendants in that suit diverted the water from its natural channel in Eldorado canyon, thereby stopping for the first time in nine years the plaintiff's water-supply and making it necessary to cease its mining and milling operations; that waters flowing in such channels and so used, appropriated, and granted, are subject to the same laws that govern surface streams, and that such reservoirs and such subterranean water-channels developed in mining along the dikes in the impermeable igneous rocks of arid regions frequently comprise the sole water-supply for operating that property, and if not being used by others, it becomes by filing, appropriation, beneficial use, and State grant the property of those who developed it; then, its diversion by later comers to the district should not be confirmed by court decision. I regret the necessity for even briefly supplementing my former letter in an effort to establish the fact of these conditions, but they are basic, and, together with the attitude of the courts toward them, constitute a problem of grave interest to many mine-operators in arid regions.

In Mr. Walker's reply to my former letter, his most plausible opposing contention is that his water shaft sunk in Eldorado canyon above plaintiff's shaft could not have attacked plaintiff's water-supply, because he did not pump water from the canyon until some weeks after plaintiff complained of the sudden stoppage of its water-flow.

MAP OF NEVADA SHOWING AREAS COVERED BY THE PRESENT AND OTHER WATER-SUPPLY PAPERS OF THE UNITED STATES GEOLOGICAL SURVEY 1918

25 0 25 50 75 100 Miles

From U. S. G. S. Water-Supply Paper 425-D, by G. A. Waring, 1919

Mr. Walker's predecessor pumped water from this canyon-shaft over the mountain to the mill for several weeks during the early summer, and then ceased such pumping and mill operations to deepen the water-shaft and run drifts and cross-cuts from its bottom. During this quite extensive development work the muddy water constantly baled from the shaft to permit work was not pumped over the mountain to Mr. Walker's mill, but was dumped into the 'wash', whence it could not return to its subterranean channel and thence into plaintiff's mine workings because the conducting dike-apex is almost continuously above the canyon floor for the short distance between these two openings in the channel. It will therefore be readily seen that the effect of this hourly exhaustion of the water from the dike fracture as opened by Mr. Walker's water shaft as effectually cut off plaintiff's water supply as did his resumption of pumping over the mountain in the fall. The fall is the season of low water in that region. Plaintiff's ten years experience had demonstrated a water flow of about 9000 gallons per day during this dry season, and up to 20,000 gal. during the wet season of the year.

Shortly after Mr. Walker's resumption of pumping, he told me that he was taking 8000 gal. of water a day from Eldorado canyon, but that he hoped later to reduce that pumping to 5000 gal. At that time plaintiff was getting less than 1000 gal. per day in its shaft, as against the 9000 gal. formerly coming to it during the dry season. Mr. Walker's statement that his water-shaft supply and the water in the dike fracture a mile farther down the canyon could not be the same, because of difference in analysis, is hardly plausible, because of the chemical changes probable to water in subterranean transit when passing from one enclosing rock to another, as does the water-carrying dike in question; which passes from monzonite to old andesite between Mr. Walker's shaft and the defendant's mine-workings. His suggestion that the water of the region should be treated as percolating water because of the many fractures common to the igneous rocks of the district is not supported by the fact of the absence of water from the miles of drifts, shafts, cross-cuts, and tunnels in the property worked by him, and in other properties, even in Eldorado canyon, whose workings do not open the water-channel. If "the inconceivably complex maze of faults, fissures, joints, fracture-zones, and erratic areas of permeable rocks" as pictured by Mr. Walker, really carried water, the operator's problem would be one of too much water, instead of not enough, and the present conflict could not arise. In Eldorado canyon all these fractures are dry, except the main dike-fracture and its two or three tributaries. I am seeking an adjustment of law to the needs of arid regions, not to localities where all the complex rock-fractures are filled with water.

In view of these facts the question arises, how can a man who invests in the development of his mine and in the building upon it of a mill, basing his operations upon a water-supply and grant of the nature and conditions of the sufferer in the case cited, be protected from ruinous trespass upon his water-supply by later comers to the district?

Several attorneys and judges of special information and experience in water law and decisions in Colorado, Utah, Nevada, and California have stated to me, in effect, that conditions as herein recited set up a water-course and ownership governed by the well-known laws pertaining to surface streams, and that the miner who first develops, uses, and under the laws, files upon and is granted his needed portion of such water, and continues it in beneficial use, stands, in ownership, in the same legal and community relationship to that water as does the farmer to his rightly appropriated and granted water taken from a surface stream. This view will, I believe, commend itself generally to mining men as the most equitable, rational, and simple solution of the problem.

We will admit that care must be exercised by the trial judge to learn whether the ground formation and topography of the section in dispute induce or permit percolation, in the proper meaning of that term; or if the contained water can only move along fractures of the impermeable rock in the manner of the following of depressions upon the surface by streams and their tributaries. This determination is not as difficult as Mr. Walker would have us believe, if the trial judge, after going as far as he can with the testimony and exhibits in the case, will apply "the simple plain common-sense" so ably advocated by Mr. Walker, and make a leisurely personal inspection of the section involved in the suit; taking with him, at the cost of the contestants, his own advisory engineer, if he wishes to do so.

These water cases are well worthy of such personal study by the Court, and during such action the judge may employ various means of satisfying himself as to the questions at issue, and the truth of the testimony presented. For instance; at the close of the trial of the suit cited in this discussion, Judge Horsey, the trial judge in the case, agreed to visit Eldorado canyon and to study its water conditions before rendering his decision. After this, and some months before decision in the case was rendered, the plaintiff succeeded in getting a few gallons of fluorescene, and urged the judge to put this strong coloring, though perfectly harmless, agent in Mr. Walker's water-shaft, and see if the fluorescene color did not presently show in the water-channel openings farther down Eldorado canyon, including the mine-workings of the plaintiff; the latter agreeing to abide by the result of the test. Mr. Walker, through his attorney, refused to consent to this test and Judge Horsey did not visit Eldorado canyon; but the serious results depending upon his decision warranted the proposed effort by him to arrive at the truth, and it may be that Nevada laws, with some modification, would be sufficiently protective if usages sanctioned such aids to the conclusions of the judges.

If necessary, readjustment of court procedure should be made to meet the demands of equity in such cases, and personal inspection and such simple and conclusive evidence as the proposed fluorescene test would disclose should come within the scope of the Court's study of the case, not to be regarded as prejudicial to either party to the suit, but as a high endeavor to arrive at justice.

G. A. Duncan.

Hollywood, California, February 5.

Molybdenum-Steel

The Editor:

Sir—We notice on page 145 of your issue of February 1 an article regarding tungsten and molybdenum in 1918, in which you say with reference to molybdenum steel: "This material was made by the United Alloys Steel Co., at Canton, Ohio, a concern owned and controlled by Garford & Timkin, which is closely associated with the Ford Motor Co."

We would like to call your attention to the fact that we are not owned or controlled by any company. We are at a loss to understand how you could have received this information, and would like to have you correct this mistake if possible.

United Alloy Steel Corporation.

[The article mentioned was an abstract of a review published by the U. S. Geological Survey, as is stated clearly in the text.—Editor.]

Graphite in Texas is found in the silicious pre-Cambrian Packsaddle schist in the central region of the State, between the towns of Llano and Burnet. In many places, the graphite schist has been penetrated and disrupted by granite and pegmatite intrusions. This schist, according to Paige, is a metamorphosed sedimentary, in which the carbonaceous materials have been re-crystalized to form graphite. The ore analyzes 6 to 10% graphite carbon, but the recovery of No. 1 flake is comparatively low because of the presence of amorphous graphite and very small flake in the ore; moreover, the gangue is hard, so that in crushing, a large amount of the flake is destroyed by being ground to finer sizes than are used as No. 1 flake. Three properties are now operating: the Southwestern Graphite Co., 9 miles west of Burnet, and the Burnet-Texas Graphite Co., 7 miles west, have developed open-pits; the Dixie Graphite Co., 4 miles north-east of Llano, is mining underground.

'Kish' consists of graphite, slag, iron oxide, fragments of iron, and other materials that accumulate about a pig-iron casting-ladle, or a Bessemer or open-hearth furnace. The graphite is formed during cooling by the crystallization of excess carbon from molten pig-iron. The kish obtained for refining has contained 8 to 10% of graphitic carbon in the form of a light, thin, and fluffy flake. The method of concentrating and refining kish is similar in many ways to the methods employed with natural graphite. The chief points of difference are that kish is not subjected to crushing, but is carefully screened and passed over magnetic separators. Kish, as a possible source of graphite, should not be overlooked. At the present time, however, it is questionable whether enough of this material can be obtained to interfere or compete seriously with the mining of natural flake graphite.

Magnetic separators, somewhat similar to those used in the zinc-ore plants of Wisconsin, find a place in foundries for separating sand, coke, and iron. Cupola cinder should be crushed first to free the iron, the larger pieces being ready for re-melting, but the finer particles mixed with slag are passed through the separator. Ordinary floor scrapings and chippings are shoveled directly into the machine. Only direct current can be used.

Batteries, chemicals, and kindred industries consume 25,000 tons of high-grade manganese annually, about 1/30 of that used in steel manufacture.

Rossiter W. Raymond: In Memoriam

Addresses by HENRY S. DRINKER and T. A. RICKARD

A memorial service in honor of Dr. Raymond was held on February 17 at New York on the occasion of the annual meeting of the American Institute of Mining Engineers. Dr. Raymond, who was Secretary Emeritus of the Institute, passed away suddenly and peacefully at his home in Brooklyn on the last day of 1918. As the official announcement said, "his passing marks an epoch in mining and metallurgical literature." He is survived by his wife and daughter, both of whom, together with relatives and friends, were present at the memorial service. Sidney J. Jennings, the president of the Institute, presided and opened the meeting with a short and appropriate reference to his great services to the profession of which he had been so long the recognized leader. Addresses were delivered by Dr. Henry S. Drinker, president of Lehigh University and one of the founders of the Institute, and by T. A. Rickard.

Address by HENRY S. DRINKER

A friend, whom we loved, has gone from among us. He was a man who by his genius dominated any assembly in which he stood. He was a teacher of teachers, a leader in all the many lines in which his energetic able personality led him. Of his eminence as an engineer, and of his ability, learning, and surpassing power in argument and presentation as an expert and as a lawyer, I will not speak—the tributes paid him by Mr. Rickard and Mr. Ingalls are so well studied that they should stand as the record of our friend's professional reputation. He was a wonderful man in the absolute absence of pretense in all that he said and did. If Raymond said it, you could rely it was so—and his mind was so encyclopedic—his learning so vast, that association with him was an education, intensive and broad.

It was my privilege to know him for a lifetime. We were associated with the founding of our Institute at Wilkes-Barre in May 1871. I was then a young fellow just stepping out into practice from college training under Rothwell in the Lehigh School of Mines, and Raymond and Rothwell, Coxe and Coryell, the men who organized the first coming together of the Institute, were men in the leadership of the profession, earnest, enthusiastic—early exponents of the profession they dignified and in fact introduced into this country.

From the beginning, Dr. Raymond's trained mind, inexhaustible energy, and wonderful aptitude of expression enhanced by his personal charm of manner, meant everything in the early setting and development of our Institute, which has grown into such a power in the engineering progress of our land.

We all pay tribute to Dr. Raymond's recognized ability and power of leadership—but there are today but few of us left who can personally turn and look back over a half century of actual association with him, a precious privilege filled with memories of a man of whom it may well be said he was typical of "whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report," for he was of virtue—and we may well, in thinking of him, think of these things. Dr. Raymond was generous in his encouragement and aid to younger men. I can personally, with all my heart, echo the words of Ingalls in his recent splendid tribute to Raymond where he speaks of having in his early association with the 'Engineering and Mining Journal' looked on Raymond as "a guide, philosopher, and friend," trite words—but never more aptly or better or more truthfully applied.

Dr. Raymond's history has been recorded, and his engineering record has been and is being given by men far better fitted than I to do technical justice to so large a subject. It is for me as one of Raymond's many friends and admirers, one of his old friends, yet speaking from the standpoint of one younger than he and ever looking up to him as a leader and teacher, to pay tribute to his personal qualities that so endeared him to all who were privileged to know him. I owe a great personal debt to him for encouragement and aid to me as a young man, and I am moved to speak of it only as an instance of what was common to so many, for he was ever ready with counsel and cheering words of uplift and practical suggestion to the younger men who came under his observation, and in this he typified in person what our Institute has done as an Association. Founded as it was by men of large heart and human sympathy, such as Raymond and Eckley B. Coxe, the Institute, particularly in its younger days when our membership was small, and the friendships engendered among members were intimate and common to all, did, and indeed has ever continued to do, a great work in giving to young engineers who came into its fold opportunity for betterment by association with older and eminent men, with an opening for the publication and discussion of their engineering experiences, and theories. In the development of this practice, and as the able Editor for many years of our Transactions, Dr. Raymond ever showed his kindly sympathetic helpful nature, and the men, and their number is legion, whom he so aided, pay tribute today to his memory with loving gratitude and appreciation.

He was a wonderful man in his faculty of doing so well so many different things.

Did his record rest only on his professional work as Mining Engineer, Metallurgist, and Mining Lawyer, his friends might be content, but he was not content with this. Dr. Hillis has told us in his beautiful tribute to our friend, of Dr. Raymond's leadership in religious work in Plymouth Church, and how after Mr. Beecher's death Dr. Raymond was asked to retire from his engineering and editorial work and take up the pastorate of Plymouth Church (and how beautifully his reply reflects Raymond in his sincerity, good judgment, and never-failing humor). Dr. Raymond said, that the Providence of God, through his fathers, had lent him certain gifts, and by His providence guided him into an appointed path, and now that his life journey had been two-thirds fulfilled, he did not believe that the Lord was going to return to the beginning of that path, and reverse Himself, and he would, therefore, follow the way appointed to the end thereof.

And in Plymouth Church and the friendships he made and cherished there, we can see how, while laboring for the good of his fellow-men, and for their souls' good, he yet rested from his professional work, and took pleasure and solace in his touch with the church and sunday-school in which his heart delighted.

His addresses in the church of which many have been published, show a vivid and ever fresh and inspiring flood of wise helpful admonition and teaching—and his annual Christmas stories to the sunday-school children—fifty in all—ending with the one given on Sunday, December 29, only two days before his death on December 31, are a unique and beautiful illustration of the faculty he possessed of using his great gifts for the young. The fiftieth and last of his sunday-school addresses is as vivid in interest as its predecessors, among which those who read them can never forget the delicious talks chronicling the woodchuck who inhabited the Doctor's garden at Washington, Connecticut, and who is introduced with the words—"At our place in the country, where we spend five or six months of the year, we have among other fascinating attractions, a woodchuck of our own. That is nothing very remarkable. The whole region is full of woodchucks, and the difficulty is, *not* to have one. . . . Our garden is not far from his hole on the lawn, yet he never comes into the garden—for which reason we call him Maud, after the lady in Tennyson's poem. That lady did come into the garden; but then she was invited. If the gentleman had sung to her 'Don't come into the garden, Maud', or even if he had never mentioned the garden, I am sure she would have stayed away politely, just as our Maud does"—and then the address goes on with Raymond's never-ending sense of humor, deliciously emphasizing the wise words on current events and international politics that are voiced by the woodchuck in his conference with his host.

As Ingalls has well said, Dr. Raymond was one of the most remarkable cases of versatility that our country has ever seen—sailor, soldier, engineer, lawyer, orator, editor, novelist, story-teller, poet, Biblical critic, theologian, teacher, chess-player—he was superior in each capacity. What he did he always did well.

In his writings and poems his ever-present sense of humor shone out—and yet always there was an adumbration of wise reflection or suggestion—often a direct emphasis of advice on current questions of the day. In his wonderful story of 'The Man in the Moon', published over forty years ago, and doubtless reflecting some of his own personal experiences as an officer in the Civil War, Dr. Raymond recorded in his inimitable way what today may well be read as a prophetic utterance on the folly and the wickedness of the world war, in his account of the way that the opposing soldiers in the ranks come together on Christmas Day—and how a sentiment in favor of peace spread from the ranks to the peoples concerned until the generals in charge of the war, and the governing authorities of the countries concerned, awakened to the folly of the contention in which they had been striving and came together in a peaceful solution.

The story is an immortal one, and those of you who have not read it, have a great treat in store when you find it: 'The Man in the Moon—A War Story.'

Dr. Raymond's home-life was ideally beautiful and loving. On Christmas Day just passed this little poem—so characteristic of him, and so expressive of the love he bore Mrs. Raymond, accompanied his gift to her of a bond:

" 'Tis strange, Oh! Lady fair and fond
Of me (as likewise I of you),
That there should be another bond
Between us two!

"You do not need this thing to make
Your life more full of hope and zest;
And yet sometimes you well might take
More interest!

"And there is nothing better serves
For weary hearts and hands to droop on,
And stimulate exhausted nerves
Than a good coupon."

Dr. Raymond suffered a great sorrow in the loss of the son of whom he was so justly proud, a loss that he bore with a man's fortitude, and in which he was upheld by the faith and hope that his life so strikingly exemplified. That he should have been first taken, leaving here the wife to whom he devoted so many years of loving care is a part of that great mystery into which we cannot look, but she at least has the comfort of the memory of her knight as one "without fear and without reproach," a Bayard among warriors, a Sir Percival among knights.

Dr. Raymond belonged to many societies and his abilities received due recognition in many honorary titles from societies, universities, and colleges. Among them it was the pleasure and honor of Lehigh University to confer on Dr. Raymond in June 1906 the first Doctorate of Laws ever granted by the Institution. When in 1905 I was asked by my fellow-alumni of Lehigh to lay aside my professional work and take on the responsibility of the Presidency of Lehigh University, it was to Dr. Raymond I went for advice on my course. He urged me to take it up and during the years since then I have reason to be grateful for his steady counsel and support, and his

ROSSITER W. RAYMOND

visits to speak to our student body have ever been welcome and uplifting.

He and our honored Dr. Drown and I had a close and common bond in the association we all three had with Lehigh, and I know of no words more fittingly applicable to Dr. Raymond than those he spoke of Dr. Drown at the time we laid the foundation of Drown Memorial Hall on our Lehigh campus. Dr. Raymond said: "How well I remember that sunny afternoon at Philadelphia, when in the sacred stillness of 'God's Acre', ringed with the noisy life of the metropolis, we buried in flowers and evergreens the body of our beloved friend, while, overhead, branches like these, waved their solemn murmurous benediction, and all around us white fingers pointed upward, mutely saying, 'He is not here; he is risen!'—and in our ears sounded that deep, dear message of the Spirit, chanting how the blessed dead rest from their labors, while their works do follow them!

"Methinks we do not always perceive the full meaning of that message. Too often we interpret it as saying, 'They depart; they cease from their labors; and the work they have done takes their place, as their only representation on earth, as all that is now left of their fruitful power'. Surely, this is not all. To rest is not to cease; to follow is not to remain behind forever separated from the leader, but rather to abide with the leader, though he be on the march.

"Our human experience is not without interpreting analogies. We know what it is to rest from our labors for a few happy summer weeks, laying upon other shoulders the daily burden and upon other hearts the daily anxiety, yet still in forest solitudes or up shining summits or by the boundless sea, carrying with us in a higher mood our work—weighing it more accurately, because we are not too tired; seeing it more clearly, because we are out of the dust of it; realizing its proportions and purpose, because distance gives us a perspective view; tasting its full sweetness, because its bitter cloudy precipitate has had time to settle; and renewing our high ambitions for it as we renew our strength for it. We rest from our labors, but our work goes with us, inseparably—only now we bear it, not as weight, but as wings.

"So, it seems to me, we are to think of our absent dead; they rest, but do not cease; they go on, and their work goes on with them. Indeed, the interpretation is yet deeper. To my ears, the Spirit says, 'Blessed are they who have labored so earnestly as to deserve the rest of a higher sphere of labor, and who have left behind them works which deserve to follow them, and to receive, even in that higher sphere, their continued remembrance and interest'."

How more fittingly can I close this tribute to the memory of our beloved friend than by these, his own words, spoken of a friend dear to him, and honored by us all—words that today we may cite as a requiem and fitting thought of Rossiter W. Raymond himself, loved by us, whose name will go down in the annals of our Institute as that of a superman of many parts to whom we owe much.

Address by T. A. RICKARD

"Brethren"—it was thus that he addressed us on an occasion that many of you will remember: in 1893, at Chicago, at the closing session of the International Engineering Congress. Other men, representing other nations, had spoken—some of them in poor English—before he was called upon to reply for the arts of mining and metallurgy in America. When he said "Brethren," the audience was startled into lively attention, which was maintained throughout his speech; for then, as always, he knew how to reach the minds of men, and their hearts too. I remember his saying that those present had taken part in numerous scientific discussions, that they had evolved new ideas and had discovered new principles, but that they had done something much better: they had "discovered one another." So saying he had put his finger on the distinctive feature of all such conventions. His mode of salutation also reminded those of us who were his personal friends that he was an evangelist as well as an engineer, and that he could instruct a bible-class in Job or St. Paul with the same power of exposition as he could deliver a lay sermon on mining and metallurgy. Indeed, Rossiter Raymond was a deeply religious man, and no sympathetic understanding of his extraordinarily versatile character is possible without appreciating this fact. He was not only a prominent member of Plymouth Church, Brooklyn, he was superintendent of the sunday-school for 25 years, he led in prayer-meeting and in bible-class, he interpreted the Old Testament during the period when the so-called higher criticism was undermining the faith of the churches, and he aided Henry Ward Beecher in steering his congregation through the storm of biblical exegesis that crossed the Atlantic forty years ago. The eminence that he attained as a religious teacher is measurable by the fact that when Beecher died the trustees asked him "to give up his work as editor, lawyer, and mining engineer, and take the pastorate of Plymouth Church," as recorded by the Rev. Dr. Dwight Hillis. He declined the honor, thinking it better "to give his life and strength to the vocation of an interpreter, chronicler, guide, and assistant to engineers, rather than to that of a creative and constructive leader." I quote the words he himself used at the dinner celebrating his 70th birthday.

Not many in the mining profession knew this phase of his character, although during his journeys through the West he would occasionally take the pulpit in some mining community and surprise a congregation that knew him only as the most distinguished of the experts engaged during the previous week in an important apex litigation. I have spoken of the part he played in the history of Plymouth Church, but his deeply religious nature was never so brought home to me as when his son Alfred died in 1901. He was a son of whom any father might feel proud; gifted and amiable, and on the threshold of a brilliant career. When he died Dr. Raymond proved, if it were necessary, the sincerity of his religious convictions, for his glad way of speaking of his departed son showed his confidence in a future reunion. I never saw a more convincing expression of the belief in immortality than in the attitude of Alfred Raymond's father and mother. It were improper for me therefore on this occasion to speak of the passing of our honored friend in a melancholy strain. I shall speak of his life and career as an inspiring memory to be treasured as a heritage of our profession; and in doing so, I shall abstain from flattery. To extol the honored dead with honeyed words is an impertinence. Rossiter Raymond's career was so rich in performance as to require none of the insincerities of conventional biography.

To the profession, Dr. Raymond's work as Secretary of the American Institute of Mining Engineers was the outstanding feature of his supremely useful life. When the Institute was founded, in 1871, he was elected vice-president, with the understanding that he would perform the duties of president, which David Thomas, by reason of his age, could not discharge. Thus from the beginning Raymond was the real president, and, on the resignation of Thomas, a few months later, he became president, in name as well as in fact; thereafter to be elected again and again, until an amendment to the rules, proposed by himself, provided that no president could serve more than two years. Soon afterward, in 1884, he became Secretary, a post that he held for 28 years—until his retirement from active service in 1912. He was Secretary Emeritus until the end.

The duties of the Secretary included the editing of the Transactions. For this he was well prepared. He had been the writer of successive volumes of the 'Mining Statistics West of the Rocky Mountains'; he had been editor of the 'American Journal of Mining' for one year, in 1867, and for the seven following years the editor of its successor, the 'Engineering and Mining Journal', of which he continued to be associate editor with Richard P. Rothwell until they had a friendly disagreement over the 'silver question' in 1893, after which he withdrew from editorial responsibility, becoming a 'special contributor', in which capacity he assisted the editors that succeeded Rothwell. Thus he played a notable part in the development of technical journalism in this country, but I regard his share in the early editing of the 'Journal' as important chiefly because it was a training for his life-work, that of Secretary of the Institute. It is noteworthy that as the owner of the 'Journal' in its early days he found the work of writing and editing far more to his taste than the management, for in financial affairs he was too kindly to be a shrewd business-man.

As Secretary of the Institute he performed divers duties; he invited written contributions and revised them before publication; he organized the meetings; he was the administrator. In course of time his ebullient personality so dominated the Institute that he was allowed a free hand to do as he thought fit. Presidents came and went; although nominally Secretary, he exercised complete control. The personnel of the board of management, or 'council', of the Institute changed from year to year, but Dr. Raymond managed its affairs, practically without let or hindrance. The Institute became identified with him. For a period longer than a generation he was the mainspring of the activities of the Institute, its presiding genius, its chief spokesman. Those who participated in the meetings of ten or twenty years ago will retain a vivid impression of the way in which Dr. Raymond stamped his individuality on the organization. Courteous and friendly to all, resourceful and tactful in steering the discussions, witty and eloquent whenever he rose to his feet, he was the managing director of the proceedings; he gave point and distinction to them; he infused them with his keen enthusiasm; he lighted them with the brilliance of his mind. His versatility was unlimited. All knowledge was his patrimony and nothing human was alien to his understanding. Whatever the subject of a paper, he could add something to it; nay more, on many occasions when some new phase of geology or engineering was presented for discussion, he would rise to supplement the speaker's remarks and show himself so well informed on the subject as to eclipse the specialist. He did this not unkindly, but out of superabundance of knowledge and sheer exuberance of spirit. On the other hand, no member engaged in preparing a paper for the Transactions failed to obtain his whole-hearted assistance in collecting the necessary data or in hunting for the needed references. When the member's manuscript arrived, the Doctor went through it with painstaking care. Before the use of the typewriting machine came into vogue, and even after, he would send letters in long-hand of as much as ten pages, explaining or suggesting improvements in the text. As a beneficiary of his conscientious industry, I can testify to the instruction in the art of writing that he gave to those who contributed to the Transactions. He was a delightful helper and a stimulating teacher. If any criticism is to be made, I venture to suggest that he over-edited; that is to say, the writings of the inexperienced were so much revised as to be practically re-written by him. He would take the half-baked production of a semi-literate engineer and subject it to the warmth of his intellectual combustion until it emerged a wholesome biscuit. I recall a valuable metallurgical paper, written by a professor now recognized as an authority, that was so full of German idioms that Dr. Raymond had to re-write it. Shortly before the Colorado meeting of 1896 I persuaded a Cornish mining engineer to contribute a paper on the lode-structure of Cripple Creek. He was a keen observer, but a poor writer; when the paper arrived it was quite unsuitable for publication. Dr. Raymond showed it to me and said, "What am I to do with this?" I replied, "Don't accept it." "No," said he, "that would not be fair; we asked him to write it." "Yes," I said, "but I am responsible for asking him; let me lick it into shape." "No," he insisted, "that is my job, I'll see what I can do with it." He did, and he did it so thoroughly that my Cousin Jack friend obtained credit for an informing and well-written contribution to the Transactions. The result of such revision was to lessen the value of the paper as scientific evidence. The authenticity of the testimony, it seems to me, suffered by being given through the mouth of a skilled advocate. On the other hand, this overplus of editorial labor gave the Transactions a level of style that no other technical society could claim either then or since. All technical writing in the English language has felt, and long will continue to feel, the inspiration to excellence that he gave while editor of the reference library that we call the Transactions of the American Institute of Mining Engineers.

He left an enduring mark on the jurisprudence of mining. As a keen observer and a clear expositor, he achieved distinction when he became an expert witness in the litigation arising from attempts to apply the law of the apex, a subject on which he wrote a series of essays that exercised a strong influence on the interpretation given by the highest courts to that Congressional statute. In the first big case in which he took part, the famous Eureka-Richmond lawsuit, he gave the term 'lode' a definition that not only swayed the decision in that controversy, but influenced all later mining litigation. On one occasion he was invited to address the United States Supreme Court on a point of mining law, and his exposition is said to have been accepted by the Court in its subsequent opinion. At that time he was not qualified as a lawyer, but in 1898 he was admitted to practise in both the State and the Federal courts. Five years later he was appointed lecturer on mining law at Columbia University.

As an expert witness, he was, as he said of Clarence King, approvingly, "an honest partisan." He used the gift of exposition with great effect when addressing the jury, under cover of giving evidence. I recall the explanation of the formation of mineral veins with which he began his testimony in the Montana-St. Louis case. Fortunate was the jury that had the opportunity of listening to such a fascinating lecturer. He was not only an able witness in chief and extremely dexterous in circumventing cross-examination, but he was a great general. He was quick to recognize the important features of a case and skilful in marshaling his forces to the discomfiture of the enemy. In forensic duels he displayed characteristic wit and versatility. This legal practice was a source of honor and profit to him, but I venture to say that he helped geology more in other ways.

In 1868, when only 28 years of age, he was appointed U. S. Commissioner of Mining Statistics, and in that capacity he visited the mining districts of the West, which was then at the beginning of an era of widespread exploration. He was quick to appreciate the economic value of geology and to utilize the opportunities for study afforded by his official travels. In 1870 he was appointed lecturer on economic geology at Lafayette College, which appointment he held for twelve years.

When he became Secretary of the Institute he transferred his keen interest in economic geology to the Transactions. As Secretary he persuaded the engineers to record observations made underground and at the same time he induced the officers of the Geological Survey to present their scientific inductions to the Transactions in a form that rendered them attractive to the mining profession. Thus he brought the official geologist into touch with the mine-manager and consulting engineer, greatly to the advantage of all. He also did much to diminish the self-sufficiency of the Survey and to lessen the shyness of the so-called practical man. By his understanding of geology, his knowledge of Western mining conditions, and the zest with which he pursued the application of geology to mining, he aided greatly in exciting intelligent interest in the genesis of ore deposits. The Posepny volume proves that; so does the volume dedicated to the memory of his friend Emmons. In 1893 he translated Posepny's treatise from the German into his own vigorous English, and organized a discussion that enhanced the value of the original paper. By means of another treatise, by Van Hise, presented to the Institute seven years later, in 1900, he gave a fresh impetus to the study of ore deposits, the general result being to make the mining geologists of this country the leaders in a branch of study in which European scientists had theretofore held pre-eminence.

On his skill as a writer it is pleasant to dwell. He wrote out of the fullness of a rich mind, an alert imagination, and an abundant vocabulary, aided by the knowledge of several modern languages. He knew not only how to select *le mot juste*, but also how to weave words into ingenious phrases and to construct balanced sentences, following each other in logical order within well proportioned paragraphs. He liked to number his paragraphs, in order to emphasize points at issue. He wrote with pen or pencil, usually the former, because it is more resilient and therefore less fatiguing to the fingers. He did not like to dictate anything except ordinary correspondence, but he could dictate a long article or legal testimony, punctuation included, with remarkable clearness and continuity. He wrote easily, with all the joy of the practised hand and the disciplined brain. He twitted one of his contributors with having "an inveterate fluent profuseness of speech" and the happy victim protested that the phrase exactly fitted *him*, not the lesser writer. He was fluent and profuse, but not to redundance or verbosity; on the contrary, his style was marked by force and consecutiveness, and, not infrequently, by those "saber thrusts of Saxon speech" that are the delight of the critical.

His literary ability was partly inherited from his father, Robert Raikes Raymond, who was editor successively of the 'Free Democrat' and the 'Evening Chronicle', at Syracuse, New York, from 1852 to 1854, and later Professor of English in the Brooklyn Polytechnic Institute and Principal of the Boston School of Oratory. It is also a safe surmise that Rossiter Raymond owed much of his fine feeling for the language of Shakespeare to his daily draughts from that well of English undefiled, the King James version of the Bible. There is no better schooling in our language than familiarity with The Book. A third aid to the cultivation of a good prose style was his frequent exercise in versification. The expression of simple ideas in verse by means of short words is excellent training for the effective construction of logical sentences in prose; moreover, the sense of rythm incites assonance. On his return from life at the German universities, he brought with him many old folk-songs and student-songs, some of which he adapted to sunday-school use. Thousands of children sang his hymns with delight because he knew how to present pretty thoughts in simple guise. That he could write serious poetry we know; for example, the lines to the Grand Canyon engraved on the silver tray that formed part of the gift presented to him on his 70th birthday. He wrote merry rhymes for our Institute meetings and for other occasions of a similar kind, making good-natured fun for himself and his friends. This playing with words in rhyme and rhythm gave him facility of expression in the more serious business of prose, and also in public speaking.

He was a delightful speaker. Our profession has never had a more eloquent spokesman. He seemed as little at a loss for ideas as for words; his enunciation was clear, he had a resonant voice, and his gestures were natural. Owing to his retentive memory and easy delivery, it was difficult to distinguish a speech that he had written from one that was extempore.

At any gathering he was individual—a distinguished figure. The wearing of a black silk cap and an old-fashioned way of trimming his beard gave him a striking appearance. Clear eyes wide apart, an aquiline nose, and a square chin indicated imagination, perception, and determination. His military training had taught him to stand upright. His pose was that of a captain of men. When he made a humorous hit he would tilt his head and smile, as if eager to share the fun with his audience. He never touched anything without giving it a human interest. He found

> "Tongues in trees, books in the running brooks,
> Sermons in stones, and good in everything."

Rossiter Raymond exercised an immense influence in his day and generation—nay more, two generations felt the force of his personality. How he stimulated his religious co-workers has been recorded by the successors of Henry Ward Beecher. Both Lyman Abbott and Dwight Hillis have testified to the courage that he imparted to them during the troublous times of Plymouth Church. To the geologists who broke the trail for the scientific investigations of a later day he was a guide, philosopher, and friend. Such men as Clarence King, James D. Hague, and S. F. Emmons have recorded their gratitude for his support and advice. Among his engineering contemporaries were scores to whom he was an ever-ready source of information, a wise counselor, a cheery friend; for them he did many unselfish and kindly things. To those of us who were young when he was at his prime he was the very embodiment of scientific attainments. We looked up to him as the exemplar of effective writing and polished speaking, the pattern of engineering culture, the leader in everything that concerned the welfare of our profession. As Secretary of the Institute we found him a lovable man, full of natural kindness and that helpfulness, without condescension, which the young appreciate so keenly when shown by a senior whom they admire. We—for I was one of them—found him an inspiring leader and a loyal friend. Loyalty—yes, that was one of his qualities. It got him into trouble more than once, for in friendship, as in apex litigation, he was unmistakably partisan. He stuck to his friends through thick and thin; he gave them the benefit of the doubt if they did wrong, he championed them when they were set upon. Lucky was the man on whose side he fought.

He was pre-eminently a publicist and an educator; he declined the pastorate of Plymouth Church to become the pastor of a bigger congregation; he resigned his professorship at Lafayette to be a teacher in a bigger school; he was the dean of the mining profession in the United States. For fifty years the force of his personality was felt among the men that were organizing and directing the mining industry of a continent; for fifty years he did not fail to write a Christmas story for the children of his sunday-school; he was a friend to the old and to the young. Age could not wither him nor custom stale his infinite variety. He influenced those that today are influencing others; his spirit still moves among men. Blessed be his memory!

Cupels with cement bottoms were found by T. G. Martyn to be satisfactory. The mold is first filled with cement, pressed moderately, then filled up with bone-ash, and pressed as hard as possible. In experiments with crucibles those of coarse texture showed more endurance when fired. When fine-grained and hard-burned they tend to fissure in use. Necessity for repeated re-use has shown the average life to be about 18 fusions per crucible. The life is shortened by basic charges (borax, etc.,) or by bedding in glowing fuel. A borax substitute, 'fluxite', is practically pulverized fluorspar, of which 10% less should be used. Martyn believes that in the fusion this forms fluo-silicate, rendering the charge more basic, the reaction being, $2CaF_2 + SiO_2 = SiF_4 + 2CaO$. The SiF_4 forms fluo-silicate. When silver occurs in more than a trace in litharge it is never evenly distributed. For assays of low-grade material such as residues and tailing, the lead button aimed at should be 50 or 60 gm.; 20 gm. is dangerously low. The nitric acid used in parting can be economized by re-distilling. The first run of weak acid might be reserved for cleaning out the still subsequently. Soda ash containing carbonaceous matter is frequently supplied to assay laboratories. Dissolving, filtering, and re-calcining may be necessary for some purposes. The necessary heat for use in parting can be obtained most economically by having an extra muffle-door, which, when heated, can be propped up suitably and made to serve as a hot-plate on which to place an aluminum frying pan carrying the parting capsules.

A shortage of silver exists at Hongkong, according to a recent Consular Report. There is estimated to be $15,500,000 less metal at present than at the beginning of 1919, despite the prohibition of exports. About $2,000,000 has been smuggled out of the colony.

Grinding and Sizing Diagrams

By ALFRED T. FRY

In making tests of the grinding efficiency of a given machine under varied conditions, the following method of constructing an efficiency curve will be found useful in comparing and using the results obtained.

Suppose, for instance, that during each run we have sampled the feed and product for sizing; that the rate of feed and power consumption have also been determined, together with other data that may be considered important. When the effect of tonnage alteration is being studied, if several tests have been made under identical conditions, except as regards rate of feed, from which the results, shown in the accompanying table, were obtained, then, by drawing a simple graph, in which ordinates represent relative efficiency, and abscissæ represent tonnage, several points may be decided. Obviously not less than three tests should be plotted. See diagram A.

Test	Feed per day, tons	Relative efficiency
1	10	36
2	30	79
3	50	106
4	70	115

Then, by drawing a simple graph, in which ordinates represent relative efficiency, and abscissæ represent tonnage, several points may be decided. Obviously not less than three tests should be plotted.

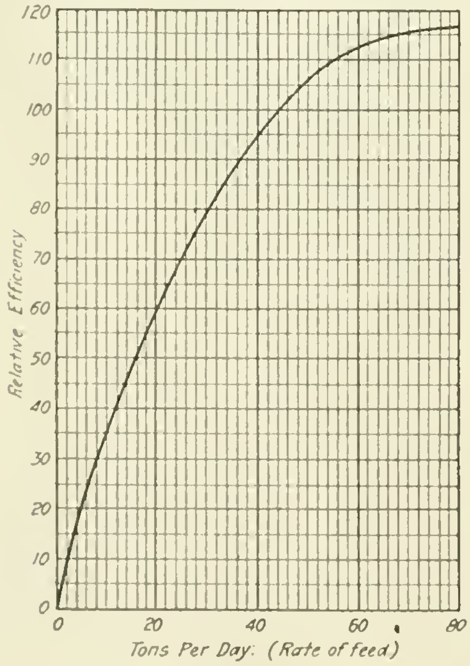

DIAGRAM A

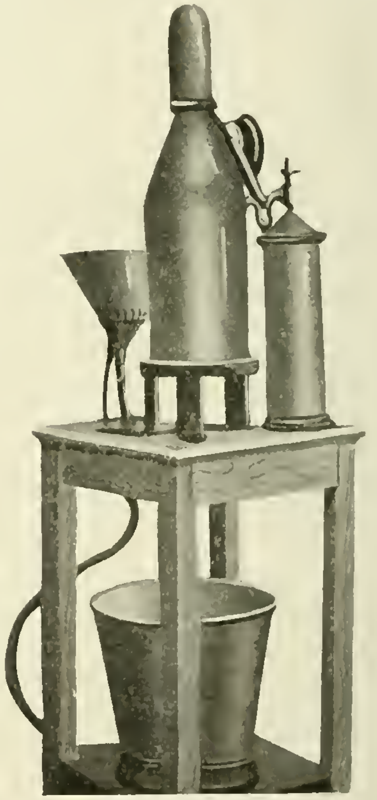
1. If the points lie on a fair curve, it may be inferred that the results include very slight interference, such as: (*a*) error in rate of feed; (*b*) error in sampling; (*c*) error in sizing; and (*d*) error in calculation. Freak results may be recognized and omitted.

2. If the upper end of the curve has attained almost a horizontal direction, it is obviously unnecessary to make further tests at the higher rates of feed. This saves time and expense, besides giving a certainty that the possibilities of the variations observed have been exhausted.

3. The curve shows the efficiency to be expected from any rate of feed of the same sample under the same other conditions in the same machine.

4. The curves resulting from sets of tests (determining the effects of changes such as rate of feed, degree of dilution, speed of machine, change of screens if used, size of feed, size of product) should be plotted together, or to the same scale, on tracing-cloth, so that they may be conveniently compared.

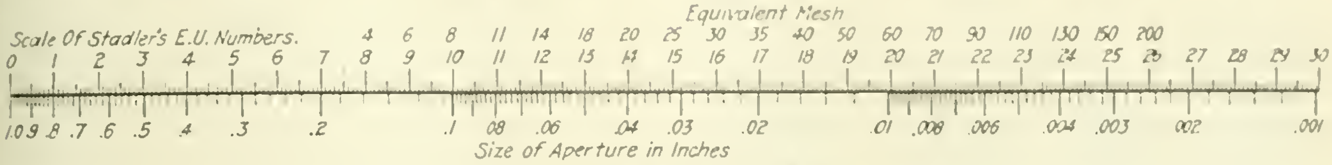


ELMORE EXPERIMENTAL SIZING APPARATUS

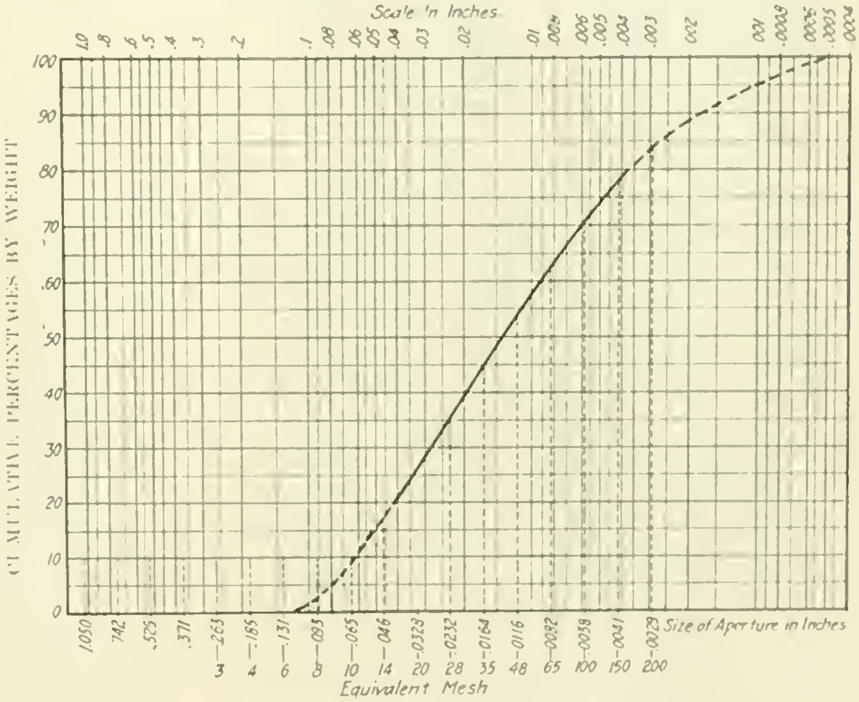
It may be well to remark that curves from a machine of a given size should not be used to predict the performance of other sizes of the same type of machine. Such curves can only suggest the best lines of making tests, for instances are known where the difference in performance of machine bears no apparent relation to the size of the machines. Thus a small single stamp might be more efficient than a large one, owing to the probability of more square inches of screen per pound of ore being presented than in a larger machine. Also, a small tube-mill might be less efficient than one of medium size, owing to the lessened distance of pebble drop as well as the decreased pressure between the pebble-surfaces resulting from a less height of pebble-load.

It may be of interest to say that I use the method of calculation of grinding efficiency, for which I, and possibly many other silent friends, have to thank H. Stadler. In view of the recent adverse criticism of his method and theories, it is a welcome development to find that in Mr. Stanley's reconciliation of the "warring laws of grinding," is a statement from which a set of sizes may be calculated in such close agreement with the 'grades' originally proposed by Mr. Stadler that these latter may be regarded as confirmed. Thus Mr. Stanley says (Journal of C. M. & M. Soc. of S. Africa, August 1914, page 27): "The work required to reduce a given weight of rock from one size to another is proportional to the log of the $\frac{\text{initial}}{\text{final}}$ diameter."

Taking Stadler's initial 1 in. diam. size, we wish to find such a set of sizes down to his lowest grade 0.00098 in., as will involve the expenditure of equal amounts of work to reduce a given weight of a homogeneous rock from any one size, or grade, to the next. The lowest size mentioned is well beyond the limits of any possible screens, and any error arising from imperfect determination of sizes beyond it will scarcely affect the problems we have to attack.



SCALE SHOWING EQUIVALENTS



SCREEN ANALYSIS, RATIO 1 : 1.414

Taking 1 in. and 0.00098 in. as the limiting sizes in the 31 grades to be determined, the work done in crushing from each grade to the next will be 1/30 of that required to crush from 1 in. to 0.00098 inch.

$$\text{Log } \frac{1}{0.00098} \text{ diam.} = \log \frac{\text{initial}}{\text{final}} \text{ diam.}$$

$$\text{Log } 1020.408 = 3.00877386$$

$$\frac{3.00877386}{30} = 0.100292462 = \text{increment for each grade.}$$

Commencing with 1-in. grade and crushing to the next grade X in., the work is represented by:

$$\text{Log. } \frac{1}{X} = 0.100292462$$

$$\text{Log } 1 - \log X = 0.100292462$$

$$\text{Therefore } \log X = 0 - 0.100292462$$

$$= 1.899707538$$

Therefore $X = 0.7937$ in. which is Stadler's second grade. Similarly the other sizes may be found. Sizes above 1 in. may be found in this way if they are required. Thus, 1.0 in., 1.2598 in., 1.5870 in., 1.9993 in., 2.5186 in., 3.1739 in., but the difficulty of handling and sampling quantities of such large sizes will in most cases preclude any use being made of these.

I have found the scale herewith a convenience in obtaining the E. U. corresponding to a size of any diameter. Its accuracy is sufficient for ordinary purposes. Its length is about 15 in. Each logarithmic interval is marked off into equal spaces representing 10 E. U. numbers, each being subdivided into 10 parts.

While the relative efficiency figures obtained in tests give a good summary of the grinding, I have often felt the need of a means of graphically emphasizing the change in sizes during a particular grinding operation, and had made several unsatisfactory attempts to devise a method. Then a friend tried to explain a cumulative-per cent diagram by A. O. Gates, but it didn't 'get over the footlights'. Then the W. S. Tyler Screen Co. kindly sent me their booklet describing two cumulative methods, the direct and the logarithmic, but partly through interruptions I did not quite appreciate them, though the cumulative percentage idea took firm root. Finally I made a diagram in this way: A horizontal base-line is divided into 30 equal parts, representing Stadler's grades 0 to 30. At the divisions the corresponding screen apertures are marked. Between these figures the even divisions 1.0, 0.9, 0.8, etc., are inserted. It is found that the resulting scale is logarithmic. Hence the easiest way to make the diagram is to copy a set of divisions from a slide-rule, the slider used upside down, and reduce them to a suitable interval. This is repeated along the base-line as required to get the three intervals. At the left end of the base-line erect a perpendicular divided into 100 parts to represent percentages; draw the horizontal percentage-lines across the diagram; erect perpendiculars from those points in the base-line which represent the apertures of the screens in use. Plot the cumulative percentages, obtained by sizing, on these lines, to plot the sizing curve. It will have been noticed that we have reconstructed the essential portion of the Tyler Screen Co.'s logarithmic diagram; but their diagram looks much more complicated by the inclusion of lines having reference only to their standard screens and by subdivisions whose utility is overshadowed by their confusing appearance. None the less, the Tyler company deserves hearty thanks for the assistance they have offered, not only in the diagrams referred to, but in the set standard screens whose apertures are marked on them. Their reminder to "Indicate the screen crushed through and also the first retaining screen" is a good one. As long as the apertures of the screens are known, however, it does not matter whether there is any definite ratio between these apertures. The main thing is to choose the screens at suitable points in the diagram. As an instance that different sets of screens yield the same sizing curve on the same sample, when their apertures are known, I quote the following sizing tests and refer to the accompanying sizing diagram. The sample was Broken Hill ore crushed through rolls to pass a No. 7 mesh screen.

The apertures of the commercial screens had been determined by a microscope with micrometer eye-piece, but the 'I. M. M.' screens were made up and could not be so determined, so I had to assume their apertures to be as quoted.

ROLL-PRODUCT THROUGH 7-MESH

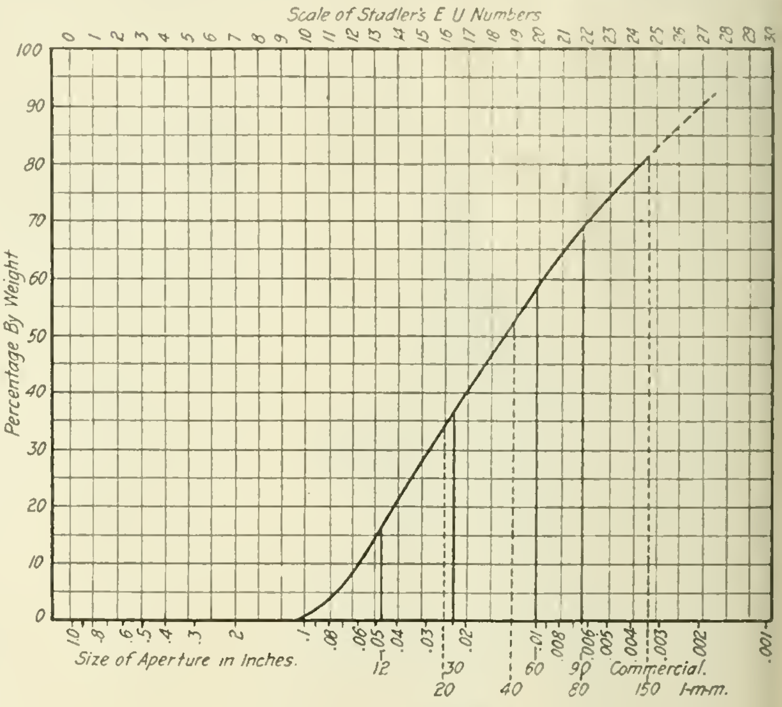
Sized on 'Commercial' Screen

Mesh	Aperture, in	%	Cumulative, %
12	0.017	16.5	16.5
30	0.0229	19.9	36.4
60	0.01	22.2	58.7
90	0.0063	10.2	68.9
−90	....	31.1	100.0

Sized on 'I. M. M.' Screens

Mesh	Aperture, in	%	Cumulative, %
20	0.0250	33.2	33.2
40	0.0125	17.8	51.0
80	0.0063	20.3	71.3
150	0.0063	7.4	78.7
−150	....	21.3	100.0

It will be observed from the diagrams that the assumed or nominal apertures of the 80 and 150-mesh 'I. M. M.' screens are not borne out by their behavior in this sizing. Variations such as this may be unavoidable in the manufacture of screens, or may have been due to some other accidental cause of which I am unaware. It would be interesting to have the result put on record of sizing a particular sample on, say, a dozen or two of new 100-mesh screens, to determine what concordance in results is to be expected. The test should conclude by re-testing the first one or two screens tried, on the same sample, to see whether the sample is altered appreciably by the repeated sizing. Three ways of ascertaining the apertures are usually available: (1) Measurement with a microscope micrometer, the average of a number of readings in both directions being taken. When a microscope is not at hand, samples cut from the rolls of screen in use can be posted to someone whose equipment is more complete. (2) By another use of the sizing curve, as follows: Get an ore-sample which has been sized on a known set of screens and draw its sizing curve. Size the sample again on the screens whose apertures are required and make the list of cumulative percentages. Where these percentages cut the sizing curve, drop perpendiculars to the base-line to find the required or corresponding apertures. (3) Count the meshes both ways and gauge both wires. Referring to the standard gauge diameters, the average apertures may be calculated.



CUMULATIVE SIZING DIAGRAM

A third use of the sizing curve arose in a case where another operator on a check-sample of the product, and using a different set of screens, arrived at a different result in calculation. On drawing his sizing curve beside mine, it was apparent that a serious sampling error had occurred.

A fourth use of the sizing curve lies in cases where, in a mill, for example, it is desired to try some new make of screen without altering the degree of grinding in use. Square-mesh screens may have to be temporarily replaced by slot-wire, round or slot-punched screens. To find whether they are suitable, size the screen-feed, and draw its curve. Size the same sample on the old and new screens, and on marking the plus percentages on the sizing curve it can be seen readily whether the difference between them is likely to be of importance, with reference to the other known properties of the screen. When, however, a change in degree of grinding is contemplated, such as testing the effects on recovery of a finer screen, by making the curve of the screen-feed and marking the percentages retained by the old mill screen and the proposed new screen, one may get an idea of the extra amount at first put back into the return to the grinders, but it must not be forgotten that there will probably be a partial cumulative effect in that circuit among the fine sizes which the new screen just rejects. This is because practically all grinding machines do less efficient work as the size of the feed decreases. Thus one may have the coarse sizes well ground while the fine sizes may be imperfectly reduced and come back again from the screens. With coarse screens this effect might not be easy to detect, but with fine screens it would be more noticeable.

Bolts and Spikes From Scrap

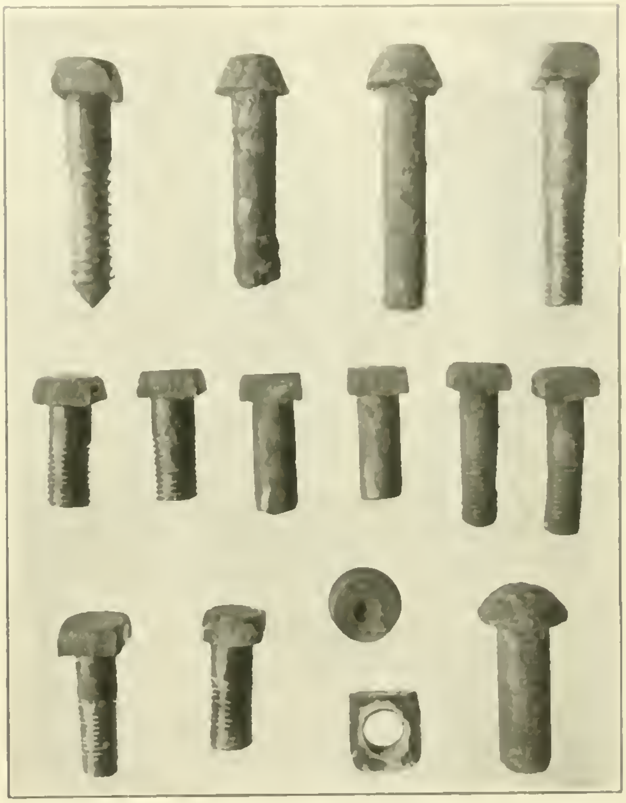
By LETSON BALLIET

During the War I was employed at one of the shipyards as an efficiency engineer. While so engaged, my mining experience proved of great benefit in several ways. Incidentally the adaption of a mining tool to ship-building work carried the development further, which I think might be profitably used at a mine.

One particular installation and its subsequent development is of interest. I had installed a Sullivan drill-sharpener with which to make bolts. The idea was not wholly new nor original with me, though I designed and made special dies and dollies for special shaped heads needed. Drift-pins were headed, countersunk heads of various sizes and the like were made in large numbers. Then we made ball stanchions, grab-iron ends, rivet dies, and numerous other things that required upsetting; in fact, the drill-sharpener became an upsetting machine of great possibilities.

Heading long rods quickly in three seconds dispensed with the necessity of threading two ends of a rod, and using two nuts. Upsetting the end of a rod to a ball, and then flattening it under the vertical hammer, and punching a hole in the flattened part, did away with drawing a rod out and welding it into an eye-bolt. In some cases this dispensed with expensive turnbuckles. All of these features will have more or less use in building of head-frames, the framework for mill buildings, and possibly in making one side of hanging-bolts, to avoid the upward pointing hook for safety. What appears to me to be of greatest value for a mine is the making of the track-spikes and track-bolts out of the scrap-pile.

Few mines can be found that do not have a lot of old bolts, hanging-rods, and scrap rod-iron lying around. This may be run through the drill-sharpener and made into spikes of any size. They make a better, stronger, and more perfectly formed spike than any that can be bought; they are all uniform because they are in effect a drop-forge spike, and all come from the same die; they can be made by the blacksmith, helper or any common laborer because they do not require tempering. A heater boy, who heats rivets, can lay them with the tongs in the die, and throw the lever that operates the machine—the machine does the rest. A perfect spike is made in about three seconds from the scrap now wasted. The machine can be so used when it is not engaged in sharpening drills, and it will make easily from 3000 to 4000 spikes in eight hours.



The above shows a lag-screw made from a burnt rivet from the scrap-pile, and a $\frac{7}{8}$ by 5-in. bolt made from another rivet. In the centre are two $\frac{3}{4}$ by 2-in. bolts made from two bent bolts with stripped threads. On the bottom line is the end of a headed drift-bolt which is 1 by 32 in., and $\frac{7}{8}$-in. nut made from a punching from boiler-plate. The nut is partly or imperfectly finished on the outside to retain enough of its rounded corners to show what it originally was.

The question arises, why pay from \$8 to \$10 per 100 lb. for 300 or 400 spikes (depending on size) when a man or boy at 50 cents per hour can make them from the scrap-pile in an hour? Any old bolt 3 or 4 in. long will make a track-spike. More than this, the same machine with a change of die, will make all the track-bolts from the same scrap or will make a new bolt out of an old one. The neck and head of every bolt is perfect in size and shape. Naturally they come from the machine without threads, but the threading die can be chucked in a small lathe or drill-press, and a head-holding tool made for the lathe or press. Thus a track-bolt or any other bolt that is costing from \$7 to \$15 per 100 lb. (depending on size) can be made and threaded for \$1 or \$1.50. Even the nuts are hot forged from bits of scrap in three seconds time, and the hole punched. They must be tapped, but by using an extension chuck fastened in the lathe, or in a wood-boring machine fastened to a work bench, we tapped them at the rate of 720 per hour.

The Attitude of Employers

By P. B. McDONALD

The outstanding problem in industry seems more and more to be that of labor. Prominent capitalists are directing their thought to get at the fundamentals of the matter in a way that a few years ago would have seemed most extraordinary. The more far-seeing employers recognize that labor unrest such as now impends cannot be quashed by ignoring or throttling it. Many of them are sincerely anxious to adjust things fairly and are striving to compensate for the traditional dilatoriness of their class as regards labor problems by convincing their business associates that a change is necessary. When such a conservative engineer as W. R. Ingalls admits the seriousness of the situation and suggests that employers may be partly to blame, it is evident that the sentiment in the country's financial circles has altered considerably in a few months. Mr. Ingalls said, in his presidential address before the Mining & Metallurgical Society of America, "Probably, on the whole, there is more intelligence among the great corporations than there is among the labor-unions, and a better understanding of economic principles, but there are some labor-unions whose leadership is bright and some corporations whose management is stupid, while of both there are many that are only mediocre."

The same attitude of conciliation is noticeable in England. The master of Balliol College, Oxford, recently presided over a governmental committee that has published an interim report of the Committee on Adult Education, in which the statement is made that "the degradation of human beings to the position of 'mere hands' and the treatment of labor as a commodity to be bought and sold, has created a revolt in the minds of a large section of the community." This same idea has been enunciated by Mr. Gompers, who protests against the ruthlessness with which employers 'hire and fire' labor. The 'Athenaeum', formerly devoted to literary subjects, has turned over a good share of its pages to the discussion of problems of labor and reconstruction. It makes the suggestion that, while wages is the obvious bone of contention, it is not everything. Unrest among workmen, argues this famous London monthly, is due in part to a sneering and condescending attitude of employers based on the premise that capital can do as it pleases in its own factory; and so it can, continues the 'Athenaeum', so long as the factory is empty, but when men enter to work, a responsibility arises that is all the more serious when it is remembered that on such labor are men dependent for the living of themselves and families. As our Secretary of War has pointed out, industry exists for men, not men for industry.

Charles Eliot of Harvard has offered the explanation, in regard to labor troubles, that increases of wages brought by strikes and propaganda do not necessarily bring happiness to the worker, because "happiness is a point of view." Perhaps it can be stated in another way by saying that the habit of mind induced in employees by frequent strikes is fundamentally opposed to being satisfied no matter what monetary conditions are obtained. If, then, the important point is the comparative contentment of the employees, it is probably true that their point of view is dependent on how they are treated by their employers. That is, the latter have the power of inspiring class hatred by their attitude toward the men who work for them. Unfortunately, too many employers have done this. Disraeli portrayed such conditions in his novels of seventy-five years ago, and, although a Conservative, he advocated improving the workman's lot.

In correcting the attitude of employers, such that class hatred will be minimized and democratic practice more nearly prevail, the mistake should not be made of patronizing, or playing to, the grand-stand. Some employers, figuratively speaking, slap an employee on the back and call him brother in a way which they think is particularly comradely, but which, as a matter of fact, is peculiarly irritating. The Y. M. C. A. in France has been criticized for just such affectation and ignorance toward the soldiers.

On the other hand, it is remarkable what a hold and influence for good some emyloyers have over the men who choose to work for them. The employee is not slow in judging character; on the contrary, he is quick to recognize the qualities of a real leader in the boss. Unfortunately, broad-minded leaders are not plentiful. The quality is, perhaps, partly a natural gift, but, for the most part, it varies with the philosophy of life of the individual. A philosophy of life can be cultivated, but to be effective it must ring true. In a general way, it might be said that the men put in charge of important industries are picked too much for showy characteristics of mis-called efficiency or for a disposition to kow-tow before the directors or owners. Such qualities as tolerance, humaneness, and far-sightedness are often disregarded to make room for pushfulness, bossiness, and obviousness. The following extract from a recent number of 'Blackwood's Magazine' is a description of the showy type of business-man as seen by the veteran soldier, Sir C. E. Callwell: "The man of business procedure, when he is placed at the head of a Government department in time of war, is well known. He makes himself master of some gigantic building or some set of buildings. He then sets to work to people the premises with creatures of his own. He then becomes wrapped up in devising employment for the multitudinous personnel that has been got together. . . . While the big men at the top are wrestling with housing problems, the staff are engaged in writing minutes to each other—a process which, when indulged in by anyone else is called 'red tape', but which, when put in force by men of business is called 'push and go'."

The more one notices the signs of the times the more it appears that quick transitions in industry and sociology are near. Pessimists are inclined to compare these present times with the decline of the Roman empire. William James considered what he called the prevalent world-weariness to be analogous to the noisy period of the Sophists in Socrates' time, and he advocated pragmatism as a practical way out. Some optimistic thinkers predict such an awakening and broadening of life as occurred in the days of the Renaissance and of the Romantic movement, the former marked by a disposition to organize into guilds of workmen, the latter distinguished by idealistic schemes for individual freedom. Whatever course things take, few will deny that a menacing tension is in the air, and that in industry much appears to hinge on the attitude of the employers.

Silverado Flotation Concentrator

By W. L. ZEIGLER

The ore in the Silverado mine is minute stringers and grains of galena, gray copper, and pyrite disseminated through a heavy gangue of spathic iron with quartz, all the silver being associated with the galena and gray copper. Gravity or water concentration is not suitable for this ore, as it requires fine grinding to free the mineral particles and the gangue is of nearly the same specific gravity as that of the tetrahedrite.

The flotation mill was built at a cost of $7500 and will treat five tons of ore an hour, making the cost of erection about $62.50 per ton of daily capacity. The mill as a unit is the utmost in simplicity, both in construction and operation, and has no screens, elevators, or pumps.

It was found that grinding to about 40-mesh gave results as good as when all passed 100-mesh. The walls of the vein are barren quartzite, which is much harder than the vein material, so that the coarser particles going to the flotation machines are practically all quartzite.

The following results were compiled from an average:

Screen-test of flotation feed

	%
On 40 mesh . . .	7
" 50 "	10
" 60 "	11
" 100 "	23
" 150 "	13
" 200 "	8
Through 200 "	28

	Feed	Concentrate	Tailing
Lead	2.6%	30.0%	0.1%
Silver	6.0 oz	83.0 oz	0.5%
Copper	0.35%	5.1%	Trace

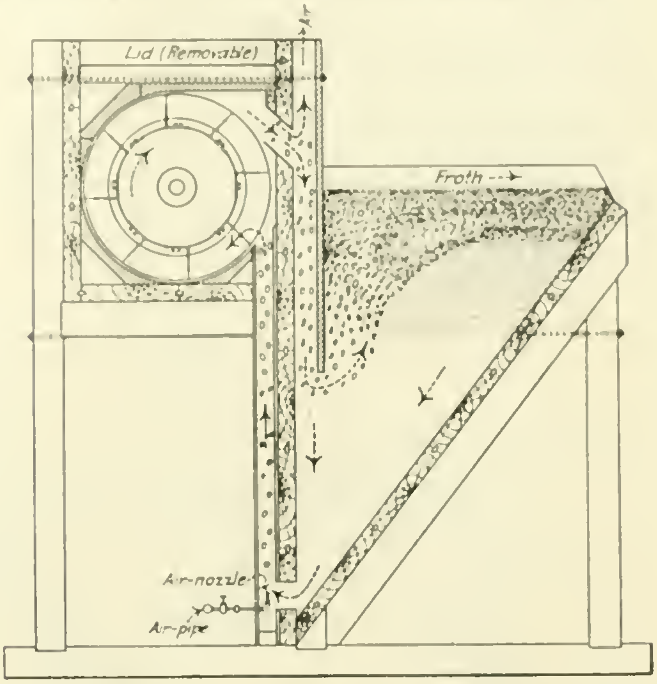
The ratio of concentration is about 15 : 1.

The lead shows an extraction of 97%, the silver 92.2%, with practically all the copper.

The total power is supplied by a 75-hp. induction-motor, which draws 13.5 amperes at 2200 volts—equivalent to about 54 horse-power.

Consumption of water is very small, 75 to 80 gal per minute being required to bring the pulp to the proper dilution. A small amount is added at the head of the ball-mill and diluted enough for classification at the discharge end.

The ball-mill is of the quick-discharge type using manganese-steel grates in the discharge end, and white-iron step-liners with chilled iron balls. The feed to the mill is delivered by a conveyor, after being crushed to [illegible] in., about 50% of the discharge being returned by the drag-classifier.



SECTION OF ZEIGLER FLOTATION MACHINE

Two Zeigler flotation machines were installed, but only one is operated at a time, as one handles the feed perfectly. They will treat the sand at 40-mesh with very little wear or trouble with clogging. Only a small amount of compressed air at five pounds pressure is required for the air-lifts, which spray the pulp and air into the atomizing-chamber. After leaving this chamber the greater part of the air passes out the openings at the top, the pulp being so thoroughly aerated that it carries enough air into the frothing-compartment to make a froth that strongly resembles that made by a pneumatic cell.

The agitator is light in weight, yet is made extremely rigid by the angle-iron blades. Angular vanes are bolted to the blades between the cells, which prevent longitudinal flow in the compartment and keep the pulp in the form of a spray. Special water-drip collars, requiring no packing, are used at both ends of the shaft, which prevent leakage. The total power required by the machine is four to five horse-power.

The concentrate flows into tanks where it is drained, and, as the principal part is galena, it settles readily.

A Mining Camp Club

*The accompanying drawings and photograph illustrate the club house built for the employees of the Tennessee Copper Co. at Copperhill in 1909. The building is a wooden structure with shingle exterior; it consists of two stories and basement and has a wide verandah around two sides. On the main floor to the right of the entrance is the billiard-room. To the left is the main hall, which is used for dances and receptions, and at other times as a music and lounging room. The library opens off the main room, thence a pantry, kitchen, etc. The library serves as dining-room when occasion requires.

On the second floor are four bedrooms for the use of directors and other visiting officials.

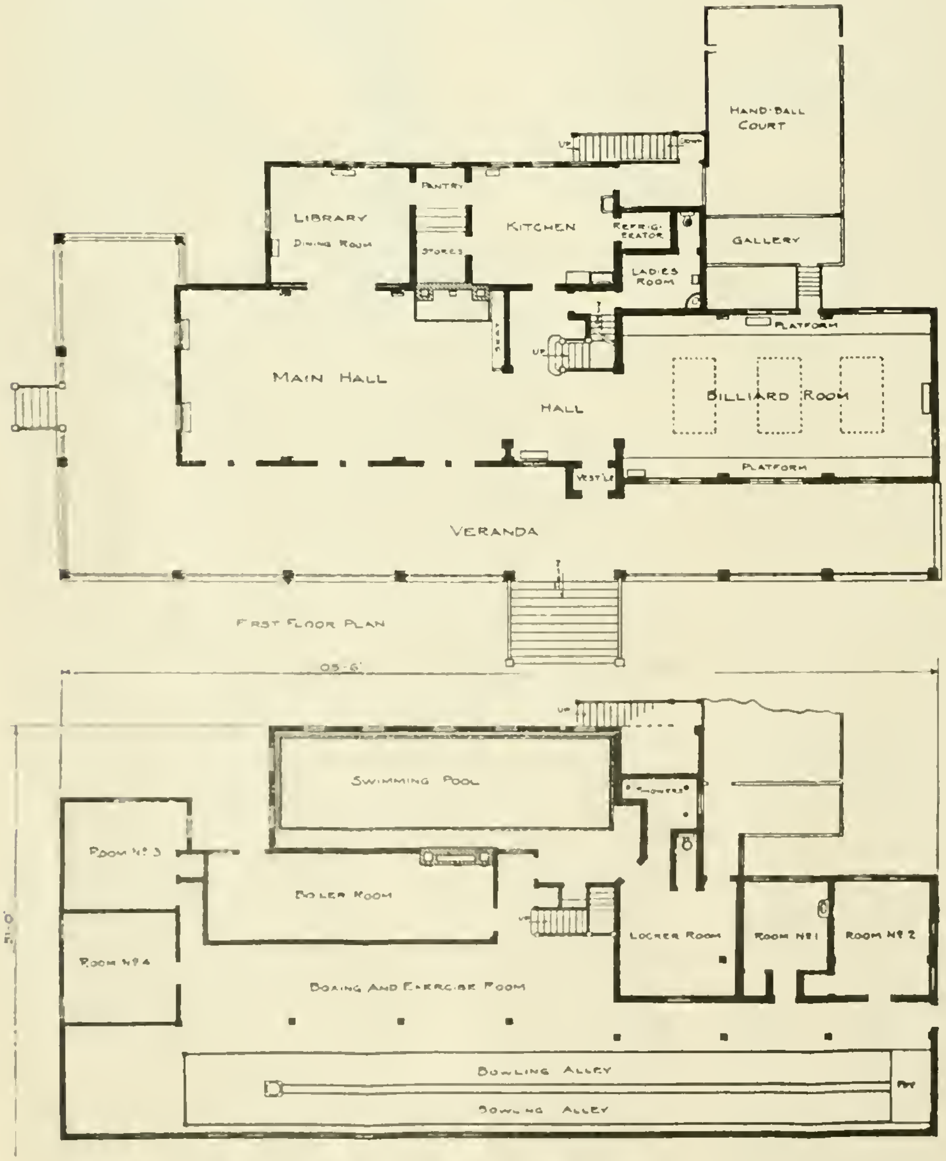
On the ground-floor are bowling-alleys, swimming-pool, showers, gymnasium, handball court, lockers, and heating plant. Outside of the building the club exercises control over two tennis-courts and trap-shooting grounds.

The organization, which is called the Cowanee Club, started in 1903 from very modest beginnings. For quarters it had a room in the basement of the office-building. Here were pool and billiard tables and an assortment of periodicals. Club dances were given in the dining-room of the company mess-house. All expenses were borne by the club, except heat and light, which the company donated. The need for proper and more commodious quarters was felt and a movement was started to achieve this end. The 40 members of the club subscribed $2000, and with this amount in hand the company was approached for assistance. The response surpassed expectations, making possible a building that cost $15,000.

The club has a State charter and its administration is altogether in the hands of the members. It is not run as a company affair, and while most of the members are on the technical or clerical staff, employment by the company is not a requirement for membership. The ladies of the members' households are accorded the same rights as the men, and the club is open to them at all times, thus taking into account the equal if not greater need of women for recreation and diversion under conditions of mining-camp life. The club house is on the flat below the acid works.

With its new home, the club soon came to be the social centre of the camp. Its design and equipment, proved so successful that the prevailing comment was "How did we ever get along without it?"

Sub-atomic studies by Kotaro Hondo show that in the molecules of a solid there are rectilinear vibrations about a mean position, and small dependent rotational vibrations about central nuclei. At fusion, the rotational vibrations become complete revolutions. The latent heat of fusion is shown to consist of the energy of rotation gained during fusion. By experiment he proved that for the elements, except where specific heat is abnormal or a transformation takes place during fusion, the latent heat of fusion consists of the energy of rotation gained by the molecules during fusion. Amorphous substances have little or no latent heat of fusion; they are very viscous liquids and already have the rotational energy characteristic of liquids.



PLAN OF FIRST FLOOR AND BASEMENT OF THE COWANEE CLUB, COPPERHILL.

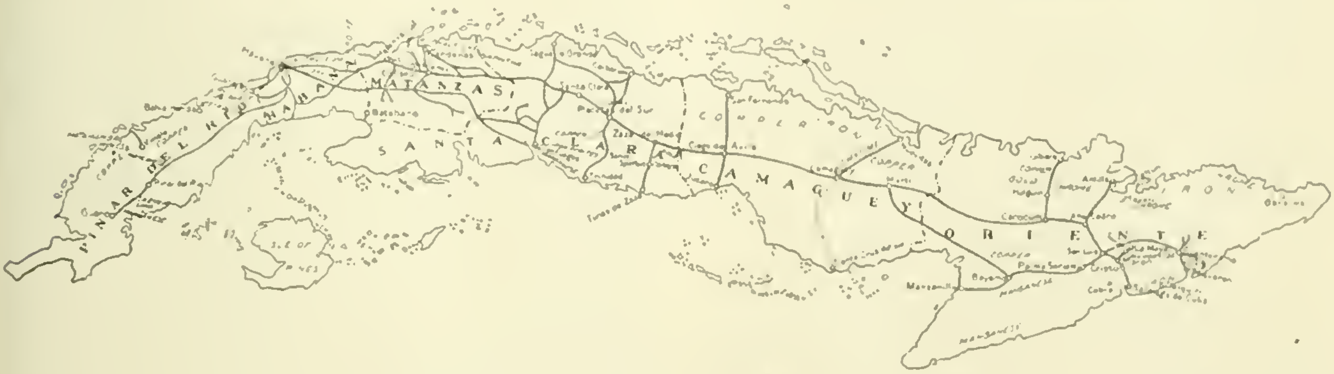
REVIEW OF MINING

HAVANA, CUBA

Mining Possibilities of the Republic.

In 'The Cuba Review' for November 1918, the mining industry of Cuba is described by Edward I Montoulieu. To the layman, even to engineers, beyond copper and iron production, the industry is considered unimportant. This idea is incorrect. The Spaniards took great interest in mining from the earliest times. Gold, copper, iron, asphalt, manganese, and chrome was the order in which the minerals were extracted from buccaneering days until the present.



MAP OF CUBA SHOWING WHERE THE VARIOUS MINERALS ARE MINED.

Mr. Montoulieu then briefly covers the various deposits and properties operating, the accompanying map showing their situation.

CRIPPLE CREEK, COLORADO

Dividends and General Development.—The Vindicator in 1918.—The Cresson Discovers More Rich Ore.

Dividends to the amount of $167,000 were paid on the 10th to shareholders of the Cresson and the Golden Cycle. The Cresson was at the usual monthly rate of 10 cents per share, $122,000, and the Golden Cycle at 3 cents, $45,000.

The Modoc is now shipping 150 tons per week from two orebodies under development on the 1200-ft. level. The No. 1532 or Last Dollar-Modoc ore-shoot is 275 ft. long, and the stope has been carried up 100 ft. so far with good indications. The new vein has been driven on for 130 ft. in length, with the value holding in the north breast. The ore averages $30 per ton.

Rich float has been found in the Petrel, a Squaw mountain property; and the lessee, Gus Nelson, claims to have found its source, a vein in place in the granitic country rock. Samples shown here were plastered with rusty gold. The property is owned by the Petrel G. M. Company.

E. B. Mack is saving ore at the Engineer, a Mineral hill property. Mack is driving on the vein in an adit, and ore in the bins will ship at about 1 oz. per ton. This is the only property on Mineral hill that is active at present.

Darwin T. Mason, lessee of the El Paso Consolidated, has opened a new shoot in the Tillery vein between the second and fourth levels of No. 1 shaft, on the south end of this Beacon Hill estate. The pay-streak, 3 ft. wide, will ship close to 2 oz. per ton for screenings and 1 oz. for coarse rock.

The Backhoff Leasing Co., operating the properties of the Midget Bonanza company on the western slope of Gold hill, has resumed production after a shut-down lasting from December 1917. Ten sets of sub-lessees are at work.

The annual report of the Vindicator Consolidated Gold Mining Co. was presented at the annual meeting last week at Denver, by George A. Stahl, the general manager. The output during 1918 was 230,304 tons of crude ore, from which was shipped to the mill or smelter 21,392 tons of ore valued at $1,166,295 gross. Lessees shipped 24,320 tons worth $463,513, from which the company received $151,285 in royalties. The flotation plant treated 222,626 tons averaging $2.13 per ton. Of this, 176,623 tons of $1.42 ore was rejected by screening and 46,003 tons assaying $4.18 was sent to the flotation plant. There was shipped from the flotation plant 6029 tons of concentrate valued at $206,254 gross, and after marketing $171,037 net. After deduction of all operating costs the net profit from this source was $27,955. The yearly financial statement shows a gross income of $1,175,471, of which $1,167,181 was proceeds of ore sales on company account and royalties. Ore-reserves are estimated at $870,129. The company's property is valued at $1,269,613; mill, $181,286; mine equipment, $287,658; and ferro-alloy plant and equipment at Denver, $68,696. Current assets are given as $574,927, including $279,316 cash, and $50,000 U. S. certificates. Dividends paid during 1918 amounted to $69,000, making a total of $3,772,500.

Another rich discovery is officially reported by the Cresson company. This was made at the 10th level of the main shaft, where a new orebody has been opened, with ore assaying 10 oz. per ton.

Fifty-dollar ore has been exposed in a new vein opened in the Yellow Bird, a Gold hill property, by Martin Colgin, the lessee. The shaft is down but 25 ft., and will be equipped with an electric hoist.

The discovery made by J. L. Wilson in the Anaconda tunnel of the Mary McKinney company on the southern slope of Gold hill persists with development. The vein cut, between 3 and 4 ft. wide, is assaying from $30 to $160 per ton. Shipping commenced last week.

COBALT, ONTARIO

Labor in Plenty.—Boston Creek Developments.

For the first time since the period of labor shortage due to the War set in there is a surplus here. It is now possible for mine managers to select experienced men.

Shareholders of the Ophir company have ratified an agreement giving the Nipissing an option on a two-thirds interest for $150,000. The Nipissing is now in possession of the property, and will carry on development at the contact at a depth of 580 feet.

Production at the Kerr Lake is falling off considerably. The December output was 102,289 oz. of silver, a decrease of about 50% when compared with the monthly average of the last two years.

The annual statement of the Temiskaming showed earnings of $425,014, and profits of $135,394. Current assets amounted to $870,114.

Boston Creek.—The result of sinking the Miller Independence shaft to 500 ft. is a large tonnage of high-grade ore. Plans are being prepared for erection of a 100-ton mill and roasting plant.

At the Cotter property the eastern continuation of the Independence vein has been cut by diamond-drilling at a depth of 600 ft., with high assays.

The Patricia was closed last fall on account of labor shortage and the difficulty of obtaining fuel, but arrangements are being made to resume in March, when the shaft will be sunk.

A 75% interest in the Connell, adjacent to the Independence, has been sold to Dayton people.

VICTORIA, BRITISH COLUMBIA

Engineers to Have Access to all Properties.—Educating Miners.—Gold-Cobalt-Molybdenite Ore.

Engineers in the employ of the Provincial government, of whom there are six, each having charge of one of the mineral districts into which the Province has been divided, have been given authority to make examination of any metalliferous mine, reduction works, or concentrating plant. Non-compliance entails a fine of from $10 to $500. It is not suggested that the engineers have received anything but the most courteous treatment from the mine and smelter operators, but the Minister of Mines proposes that they shall be provided with the fullest authority in carrying out their responsible duties.

Arrangements have been made by the Minister of Mines and Minister of Education for the establishment of a system of instruction by means of correspondence, which will give all miners who are British subjects and resident in British Columbia an opportunity to qualify for positions of trust and responsibility in connection with their chosen vocation. In making this announcement it is pointed out that for some years the Department of Education has been conducting night schools for the benefit of men engaged in the mining industry, with a view to providing that instruction which is necessary for thorough preparation for the examinations set by the Department of Mines for those aspiring to important charges in connection with the operation of mines. The conditions of the shift system under which miners work heretofore has mitigated against the success that is so much desired by both the Mines and the Education departments, and in order to overcome this difficulty and to bring the opportunities of study within reach of a greater number of men the decision has been reached to conduct the classes and disseminate the required knowledge through the medium of correspondence. It is considered probable, although no definite statement has been authorized as yet, that the correspondence will be augmented by personal visits on the part of instructors to the various sections of the Province for the purpose of giving at intervals such guidance and assistance to students as, perhaps, may not readily be obtained through the mail.

The property of the New Hazelton Gold-Cobalt Mines company, situated on the west side of Rocher de Boule mountain and close to the line of the Grand Trunk railway, gives promise of developing into a producer of importance. Returns have been received on a carload of gold-cobalt-molybdenite ore which was shipped last August to the Government ore-testing plant at Ottawa. The gross value of the 26 tons, based on molybdenite at $1 per lb., cobalt at the same, nickel at 50 cents, arsenic at 5 cents, and gold at $20, was $2399. This company some months ago shipped 28 tons to the Anyox smelter that gave returns of $1090 in gold, or $53 net per ton in gold alone after payment of railway and smelter charges. As there is no means at Anyox for saving the other metals they were not considered.

PORCUPINE, ONTARIO

Labor Influx and Accommodation.—Kirkland Lake Producers.—Cobalt Developments.

Porcupine.—A large number of the men laid-off by the International Nickel Co. at Sudbury are seeking employment on the goldfields, in addition to the influx of labor from southern Ontario. The main drawback in the way of the companies increasing their staffs is the lack of house accommodation, which is entirely inadequate. The Hollinger has undertaken the construction of 50 new dwellings for its employees, which, however, will only go a short way toward meeting the difficulty. Until sufficient provision has been made for housing the men the plans of the leading producers for greatly increasing their forces cannot be put into effect.

Kirkland Lake.—At the annual meeting of the Tough Oakes on January 23 it was announced that as the result of litigation, control of the property had been handed over to the directors chosen on January 26, 1916. The number of directors was reduced from seven to five, the following being elected, Harry Oakes, R. J. Robins, John B. Holden, J. Y. Murdoch, and A. Burt. The head office was changed from Haileybury to Toronto, and the sale of unissued shares at a discount of not less than 55% of par value authorized. An investigation will be made by a competent engineer before any program of operation is adopted.

The fifth annual report of the Teck-Hughes shows that operations were carried on under great difficulties, resulting in the mill being closed down in July, having during the previous term of about 10 months treated 15,879 tons of ore averaging $7.87 per ton. The December output however was the highest, 2035 tons of $10.12 ore was treated.

Diamond-drilling results at the Elliott-Kirkland have been encouraging. A large 'break' has been cut in a contact between the conglomerate and porphyry formations, and a belt of conglomerate 400 ft. wide has been passed through.

ROCHESTER, NEVADA

The Rochester Nevada Silver Mining Company.

Controlling stockholders of the five leading Rochester companies have signed an agreement fixing the status upon which these companies are to be consolidated. This supplements the earlier agreement of January 31, which placed the administrative control in the hands of two trustees. The new agreement provides for the immediate incorporation of a holding company, known as the Rochester Nevada Silver Mining Co., to control a majority of the issued shares of the five corporations involved and to bring about a single economical conduct and operation of the properties. The new corporation will have 8,000,000 shares, $1 par, of which 3,000,000 shares will remain in the treasury. Of the remaining 5,000,000 shares, 60% will be issued to owners of shares of the Rochester Mines Co. and Rochester Combined Mining Co. and 40% to holders of the Rochester Merger Mines Co., Rochester Elda Fina Mining Co., and Nenzel Crown Point Mining Co. In the division of the 60%, the Rochester Mines Co. receives 35/60 and the Rochester Combined 25/60, and of the remaining 40% the Rochester Merger receives one-half. Shares of the old companies are to be deposited for exchange in the Reno National Bank, and are to remain in pool until all indebtedness of the constituent companies is paid, but not longer than one year from April 1, 1919, and the pool may be dissolved earlier by resolution of the directors. Judge L. N. French, Frank M. Manson, and Jay H. Clemons are constituted trustees, to act as attorneys and proxies for the stockholders, and are empowered to vote all stock in pool. The directors of all the companies are to resign upon the organization of the new company, and the trustees have power to fix the number and name the members of the new directorate. A majority of the directors are to be selected from holders of the Rochester Mines and Rochester Combined companies. Upon deposit of a majority of the shares, judgments will be entered in favor of the defendant in the suit for $2,272,000 damages, brought by the Elda Fina company against the Rochester Mines Co., without costs to either side. The latter has resumed operating its mine and mill. Engineers report a large quantity of ore available in three of the properties, and under the new management a tram will be built to the Combined mill. The two mills are in good condition, and have a total capacity of 600 tons daily.

DURANGO, COLORADO

Fire Destroys Vanadium Concentrator.—Smuggler Union Closes Part of Mine.

Ouray.— The Ouray Consolidated M. & R. Co. continues to find rich shoots in the Guadeloupe. One carries 29% copper, and pockets that assay high in gold and silver have also been opened.

Placerville.—The reduction plant of the Primos Chemical Co. at Vanadium has been destroyed by fire. The loss is estimated at $100,000, but is covered by insurance. One hundred and fifty men have been thrown out of employment, and this may result in the abandonment of the little town of Vanadium, which has grown up about the plant. The works were built by the Vanadium Alloy Co. The structure was a frame type, with only part fire protection of corrugated iron. The fire started in the drying-room, spreading with great rapidity. The boarding-house, laboratory, and office adjoining escaped. Whether the buildings will be rebuilt is unknown. The large deposits of vanadium ore are now at old Placerville, and it is probable that if the plant is re-built it will be at that point, as the deposits of the Bear Creek section are practically worked out.

Rico.—The Standard Chemical Co. has temporarily closed some of its workings, as its Eastern plant has a surplus of ore on hand. There is a large quantity of ore blocked out. This will be milled as soon as water-power is available.

The Syndicate M. & M. Co. has opened a large body of lead-zinc ore.

Telluride.—An important even in this district is the closing of the Humboldt workings of the Smuggler Union company, due to high operating costs and insufficient profit. While the ore of the Humboldt carries high value in silver, it entails expensive mining and milling methods. Fortunately the closing of this part of the mine will not seriously affect production, as the majority of the men employed on the Humboldt have been placed in the other workings, and the output from these will be doubled. A number of men will be kept on development.

WASHINGTON, D. C.

The Army Gas-Mask Unsuitable for Mines.

A warning against the indiscriminate use of the army gas mask in the industries and by fire departments as being dangerous to life was issued on February 26 by Van H. Manning, director of the U. S. Bureau of Mines, who said:

"Through the fact that the American army gas-mask proved to be most efficient for the purpose intended, there has grown up a general belief on the part of the public that this type of mask will protect the wearer under all conditions against any gas whatsoever, even in absolutely irrespirable air, to the exclusion of the more cumbersome mine-rescue oxygen-breathing apparatus. This erroneous belief will, no doubt, be further confirmed by millions of discharged soldiers, who have been trained in the use of the gas-mask and have been taught that it gives them absolute protection against all gases used or likely to be used in warfare. These men will not realize that out in the open air of the battlefield the percentage of gas in the atmosphere can never be anywhere near as large as may occur in the confined space of factory operations. A mask may afford complete protection under out-of-door conditions, yet break down at once when used indoors, where a gas-container has burst and filled the room with a greater concentration of gas. It must also be remembered that the absorbent in the army respirator, which filter out the poison gas, are especially designed for the gases used in warfare, and, as a matter of fact, do not protect against the most common industrial gases, as, for example, illuminating, natural, producer, and blast-furnace gases. The army gas-mask should never be used in mines, because of the uncertainty that exists as to the amounts of gases in the atmosphere and the liability of there being insufficient oxygen to support life. Its use in the mines will lead to serious accidents and fatalities. The army gas-mask is by no means the unusual protective appliance that it is popularly believed. It does not afford absolute protection against all gases, nor can it ever be safely used in low-oxygen atmospheres. It furnishes no oxygen to the wearer and can only remove comparatively small percentages of poisonous gas from inhaled air, usually less than 1 or 2%. Higher percentages will immediately penetrate the canister and will gas the wearer. The field of usefulness of the army mask is confined to certain of the chemical industries, around smelters and roasters, where sulphur fumes are given off, and in the industries using chlorine and bleaching powder. The army canister also contains cotton filter-pads which remove irritating and poisonous dusts, which increases its usefulness around smelters where sulphur and arsenic fumes must be removed. The army mask furnishes no protection whatever against carbon monoxide. This is the poisonous constituent of blast-furnace, producer, and illuminating gases, and of mine gases after fires and explosions in coal mines. Carbon monoxide is also likely to be present in ordinary fire-fighting conditions met by fire departments. Moreover, in all of these cases there is likely to be a deficiency of oxygen. Therefore, for adequate protection the oxygen-breathing apparatus must be used, and reliance on the army mask may be fatal.

Owing to the many factors entering into the use of protective respiratory appliances, the importance of competent advice on the selection and use of such appliances cannot be over-estimated. In connection with the Bureau's work in safeguarding the health and safety of miners and workmen in the metallurgical industries, a general investigation of respirators, gas-masks, and breathing-appliances is to be undertaken at the Pittsburgh experiment station of the Bureau. The results of these investigations will be given to the industries promptly."

In the canister of the army gas-mask is charcoal and soda-lime for filtering poisonous gas from inhaled air.

THE MINING SUMMARY

ALASKA

Juneau.—The Alaska Bureau of Publicity has issued its first monthly bulletin. The matter is authorized by the Governor, and is optimistic for the current year. Mining, fishing, lumber, agriculture, stock and reindeer, climate, and business opportunities are discussed. The Territorial Legislature convened on March 3 for a session of 60 days.

Kennecott.—The Kennecott Corporation has borrowed $12,000,000 for one year from March 1 at 6½%. This money is said not to be actually needed, but it was thought advisable to obtain additional funds to carry accumulated metal (over 50,000,000 lb.) without using up cash reserves until the copper market improves, also to continue development.

ARIZONA

Ajo.—Foundations for the new 500-ton experimental flotation plant of the New Cornelia Copper Co. are almost complete. Most of the machinery is on the ground, and it is anticipated that it will be in operation within three months. The company has announced that it will curtail production 40%, with a similar reduction in working force.

It is announced that the Little Ajo company is to have a second drill-hole sunk by the Longyear company. This hole will be put down by diamond-drill instead of churn-drill as was done in the first, which reached a depth of 1750 feet.

Chloride.—Driving in the 900-ft. level of the Tennessee mine, being done by the Schuylkill Mining Co., has opened 6 ft. of ore said to be as good as any ever opened in that mine.

Christmas.—It is reported that the management of the Christmas mine of the Gila Copper & Sulphide Co. has been relinquished by the A. S. & R. Co. The mine will be operated by the receivers of the Gila company.

Clifton.—The Arizona Copper Co. in its last financial year, ended September 30, 1918, paid 3s. (72 cents) per share, against 4s. (96 cents) in the two previous years. The directors state that "in view of the present uncertainty of the copper situation the board considers it prudent to increase the amount to be carried forward, which will be £66,400 ($317,000), against £13,700 ($65,700) at the end of 1916-1917."

Jerome.—The strike has been declared off, but the mining companies will not resume work until all agitators have left the place.

The United Verde Copper Co. in 1918 produced 77,501,595 lb. of copper, 29,281 oz. of gold, and 1,292,109 oz. of silver. Of the total, 51,431,342 lb. was sold at 24.427 cents per pound. Total sales were $13,902,199.

The United Verde Copper Co. during the next two years contemplates improvements that will double the present output. These consist of steam-shovel mining, erection of three reverberatories, a coal-pulverizing plant, a crushing-plant, a Cottrell precipitator, 12 additional roasting-furnaces, and a new concrete-lined shaft.

Kingman.—A payment of $15,000 to Clack brothers has just been made by the Itleo Consolidated Mines Co., this being the first payment on the purchase price of the property.

Ray.—The fourth quarterly statement of Ray Consolidated Copper Co. for 1918 shows a net profit of $408,113, about half of the previous term. Dividends amounted to $1,182,884, thus leaving a deficit of $774,770. The mill dressed 805,600 tons of 1.621% ore, recovering 75.05%. The yield was 19,601,149 lb., making 86,919,270 lb. for 1918, a reduction of 5,300,000 lb. from 1917. The average cost of producing copper was 14.305 cents per pound, a decrease of 0.978 cents.

Tucson.—The Sasco smelter of the American Smelting & Refining Co. has been closed because of lack of sufficient ore. The mines at Silverbell will ship their ore to the El Paso plant.

Managers of the large copper-producing companies of Arizona recently met at Tucson to discuss measures to meet the new operating conditions caused by the fall in the price of copper.

CALIFORNIA

Bakersfield.—At Los Angeles, on the 3rd, the Federal Oil Inspection Board for California announced the new wage-scale for all workers in the oil industry, effective December 1, 1918, and February 1, 1919, for certain classes. Increases were awarded all employees.

Engelmine.—The Engels Copper company has reduced wages by 50 cents per day.

Junction.—The $1800 belt that was swept off the Valdor company's dredge during high water two weeks ago, has been found. Work on the levee protecting the boat is under way, so that digging will be resumed shortly.

Sacramento.—The Senate Mining Committee's only bill was disposed of on February 27. A measure by Senator Boggs proposing an appropriation of $25,000 for the establishment of a mining and metallurgical experiment station at the University of California mining building was ordered favorably reported. It will be re-referred to the Finance Committee.

COLORADO

Creede.—Collins & Wheeler are shipping a carload per day of high-grade silver ore from their lease on the Monon at Sunnyside.——Some shipments are being made by lessees from the Manitoba adjoining the Monon.——Lessees at the Bachelor and Commodore mines are making regular shipments of low-grade ore.——Nothing has been sent out from the Last Chance during the past two months, as road conditions have prevented hauling coal to the hoisting-plant; but the lessees have several carloads stored in stopes to be dispatched shortly.——The Creede Exploration Co. is making regular output from the New York mine. This company has abandoned work below the level of the Nelson tunnel at the Amethyst, as ore in commercial quantities was not found in the drifts from the Berkshire shaft. The 350-ft. level of the Commodore shaft is being driven both ways.——Regular production of a good-grade ore is being made from the Equity mine.——The Solomon has been leased recently. Some ore has been opened and preparations are being made to start the mill.

The fluorspar mine at Wagon Wheel Gap is shipping several carloads per week to various parts of the country.

Leadville.—Silver in the Fryer Hill district is receiving much attention at present, and several lessees are extracting rich ore. Some of it is carbonate, other is iron bearing.

The Dold Mining Co., having a long contract, continues to mine 75 tons of manganese ore daily, employing 65 men.

Ouray.—The American-Nettie group of 14 claims, north of this town, is to be leased for one-year terms, with extension privileges. The royalty basis is 15% on ore valued up to $100 per ton, and 20% on ore over that grade. Previously the royalty was 30% straight. This new arrangement is expected to result in more leases being taken.

Silverton.—The Sunnyside M. & M. Co. will be operating three shifts after March 1, producing two cars of lead concentrate daily and a similar quantity of zinc. The Sunnyside has been working only one shift for some time, a large force of men being engaged at underground development. The fear of contagion had a tendency to restrict the importation of miners from districts where the plague was prevalent.

The Empire State M. & R. Co. has been organized to develop the holdings of the company, which are in the Eureka district, adjoining the Sunnyside properties. The Empire will build a mill similar to that of the Sunnyside company, and anticipates similar results, as the ore carries high zinc content. The first 50-ton unit of the mill will be constructed during the coming season.

IDAHO

Boise.—The annual report of the State Mine Inspector, Robert N. Bell, for 1918 has been issued. It covers 135 pages, is illustrated, and is well indexed. Statistics are given for 21 years. The past two years compare as follows:

Metal	1918	1917
Copper, pounds	6,210,400	7,282,000
Gold, ounces	16,36[illegible]	63,000
Lead, pounds	290,818,12[illegible]	346,000,000
Silver, ounces	9,572,211	12,496,000
Zinc, pounds	41,691,000	96,000,000
Total value	$37,320,000	$46,292,210

There were 1600 full-time workers employed at mines and works last year. There were 19 fatalities, a decline of 5 from 1917; also 485 serious and 663 minor injuries. In his usual outspoken, though expert, manner, Mr. Bell discusses all phases of the industry in Idaho, especially in connection with trouble at the Morning mine, mine inspection, and ventilation. Notes on the various mines come under main heads of the metals or minerals they produce. Generally the report is interesting, and has been issued promptly. We will abstract from it in other numbers of the 'Press'.

Forest.—The Deer Creek Mining Co. will start its new 125-ton mill as soon as water power is available. The former plant was burned in August 1916. To recover gold, silver, and copper the process is amalgamation and concentration by tables and flotation. W. J. Orr is manager.

MAP OF IDAHO.

MICHIGAN

Houghton.—The Allouez company has now six electric locomotives. One on No. 19 and one on No. 20 level of No. 1 shaft are of the storage-battery type; four trolley type are operating at No. 2 shaft. Tramming costs and speed have been improved greatly.

A small steam-shovel is being tried in the Quincy mine as an aid to tramming. Calumet & Hecla has had success with this machine. Tramming is the hardest work in the mines. Good men do not remain trammers for long; they fast develop into miners, so that the problem of maintaining a new and constantly shifting supply of trammers always has been the greatest difficulty in this district even with normal labor conditions.

Electric haulage will soon be installed at the No. 6 shaft of the old Osceola. This is a long haul. Two four-ton trolleys will be used. Five storage-battery type will be placed in the North Kearsarge No. 1 and 3. One now is used on the 15th and one on the 16th level, No. 4 North Kearsarge, and are doing efficient work.

At the Calumet & Hecla mine proper, on the Osceola lode, the use of electric haulage has made profitable this low-grade copper ore. The locomotives haul two cars 1000 ft. each trip. Cars hold 3½ tons and dump by air back of the shaft directly into skips.

Ahmeek has 12 locomotives, using them the same as the C. & H. and Isle Royale.

Isle Royale is using four locomotives at each shaft—4, 5, and 6. At this mine the cars carry 5 tons an average distance of 800 ft., each car filling a skip.

Wages were cut 15% by the Calumet & Hecla and subsidiaries on March 1. About 10,000 men are affected.

MISSOURI

Bonne Terre.—St. Joseph Lead Co. in 1918 produced 160,000,000 lb., against 190,000,000 lb. in 1917. The current year's output may be lower than last year on account of the present curtailment. The net surplus at the end of 1918 was $1,823,183, compared with $5,610,273 a year ago.

Joplin.—Production of the Tri-State region last week was as under:

State	Blende, tons	Calamine, tons	Lead, tons	Value
Kansas	1,859	...	382	$100,183
Missouri	1,178	71	44	54,266
Oklahoma	5,541	...	983	283,788
Average price	$42	$27	$52	......

The total value is $83,000 greater than that of the previous week. The general tone of the ore market was somewhat improved.

MONTANA

Butte.—The fourth quarterly report of the Butte & Superior Mining Co. shows that a net operating profit was made of $96,506, compared with $145,448, $128,386, and $327,981, in the previous periods. The revenue was fairly even for the four terms. The mill concentrated 110,039 tons of ore assaying 15.5% zinc and 6.51 oz. silver. The recovery was 93.78%, yielding 15,997 tons of zinc in concentrate. Costs totaled $11.19 per ton, a reduction 3 cents, but the second quarter's costs were only $9.90. Ore-reserves were increased somewhat. The supply of labor is now plentiful.

In the suit of the Clark-Montana Realty Co. (Elm Orlu Mining Co.) versus the Butte & Superior Copper [Mining] Co., before the Supreme Court at Washington, D. C., on March 3, the plaintiff was awarded the ownership of the Rainbow lode, through prior location of the Elm Orlu claim, of which the lode is a part. The Court restrained Butte & Superior from entering the vein, which lies beneath those worked by it. The decision also awarded the Clark company $178,000 for ore alleged to have been extracted by the defendant from the plaintiff's holdings through secret underground workings.

Helena.—To maintain a State bureau of mines and metallurgy, A. V. Corry has introduced a measure to the Legislature for an appropriation of $20,000. The bureau would be connected with the School of Mines at Butte, similar to the arrangements in other States.

NEVADA

Ely.—The Nevada Consolidated Copper Co. in its last quarter reports a profit of only $10,189, against $1,070,213, $2,372,171, and $470,809 in the previous periods. After paying the dividend, equal to $1,499,592, there was left a deficit of $1,489,103. The surplus for 1918 was reduced to $9,934,361, against $13,180,526 in 1917. The mill treated in the fourth quarter 985,665 tons of 1.51% ore, plus 21,765 tons of custom ore. Operating costs were 19.01 cents per pound, a decrease of 1.69 cents.

Goldfield.—The Goldfield Development Co., successor to the Goldfield Consolidated Mines Co., has elected Corrin Barnes as president, A. I. D'Arcy as vice-president and general manager, H. G. McMahon as secretary and treasurer, with A. H. Howe and B. J. Henley as other directors. The capital is $125,000, shares 5 cents par, of which 1,500,000 shares have been set aside to permit Consolidated holders to have the first opportunity for purchasing shares in the new corporation, their purchases to be limited to one share of Development for each share of Consolidated held. All subscriptions by Consolidated holders must be in the hands of the secretary before March 20. Twenty-six leases have been granted so far.

Manhattan.—The White Caps company has opened the main orebody on No. 6 level.

McGill.—The Nevada Consolidated Copper Co. is to open a new store here and at Ruth, supplying employees with groceries at lower prices than the local firms charge.

Tonopah.—The Extension in January treated 9390 tons for 1324 oz. of gold and 131,549 oz. of silver, and a profit of $65,251.

NEW MEXICO

Santa Rita.—The Chino Copper Co.'s report for the fourth quarter of 1918 shows a net profit of $66,801, compared with $1,030,562 in the third period. Dividends paid were $869,980, leaving a deficit of $803,179. The mill treated 991,400 tons of 1.705% ore. The output was 20,191,391 lb., making 79,340,372 lb. for the year, a decrease of 4,000,000 lb. Costs totaled 18.10 cents per lb., a drop of 0.98 cents.

OKLAHOMA

Bartlesville.—The Bartlesville and Lanyon-Starr zinc companies have curtailed smelting operations by 50%, laying off over 200 men. The companies assert that at present prices for spelter they are running at a loss.

Miami.—It is probable that a school of mines will be organized here. The Tri-State Safety and Sanitation Association is behind the movement, and 29 members of the State legislature recently visited Miami and Picher.

TEXAS

Terlingua.—A promising quicksilver district is being exploited in a remote section of the Big Bend region, 50 miles east of this place, according to B. H. Hedrick of San Antonio. Some claims are yielding rich cinnabar, but no furnaces have been erected yet. In the Terlingua district the Chisos, Rainbow, Study Butte, and Texas Almaden properties continue operations.

UTAH

Alta.—The Albion, Alta-Germania, and Mineral Flat properties of 600 acres have been consolidated under the name of Albion Consolidated Mining Co. G. H. Watson is general manager. The Quincy tunnel, now 1¼ miles in Albion ground, is to be extended, and it is estimated that 400 ft. should cut the downward extension of lead-silver ore on the surface.

Bingham.—Effective March 1, the Utah Copper Co. has reduced wages of skilled miners another 25 cents and all other labor 20 cents per day. At the mills the cut was from 15 to 25 cents.

The Utah Copper Co. reports a profit of $1,577,138 during the last quarter of 1918. In the previous term it was $4,169,697. Adding other income, there was available the sum of $3,331,728. Dividends absorbed $4,061,225, leaving a deficit of $729,496. The mills concentrated 3,047,400 tons of 1.23% ore, recovering 64.43%. The copper output was 48,303,692 lb., making 197,978,557 lb. for the year, a decrease of 8,000,000 lb., an increase of 1.07 cents

Garfield.—Up to February 26 a total of 259 men had downed tools at the A. S. & R. smelter here, as a protest against the cut of 75 cents in wages. The Magna mill of the Utah Copper Co. was closed on the 27th.

Heber.—The Glenallen Mining Co.'s 100-ton mill is nearly completed. The property is near that of the Ontario company at Park City, and the ore carries lead, silver, and zinc. J. B. Allen is general manager.

Park City.—The Daly West, Judge, and Ontario companies have reduced wages by 75 cents per shift, effective March 1. This is the first cut made in this district.

Salt Lake City.—The Cardon bill, passed by the House and sent to the Senate, provides for the creation of a State Securities Commission, consisting of the Secretary of State, State Bank Commissioner, and Attorney General. It would be the duty of this Commission to pass upon all proposed issues of stocks, bonds, or other securities by corporations in the State. It would require that persons engaged in the sale of securities be licensed by the board. The issuance or sale of securities not authorized by the Commission would be made a felony.

The joint appropriations committee of the Legislature has not reported favorably on the proposed fund of $12,000 for maintenance of the office of State geologist.

Tintic.—The Tintic Central Mining Co.'s balance-sheet for 1918 shows a deficit of $205. The revenue was $14,351, including an assessment of $9942. Most of the work was carried out on the 1700-ft. level. Part of the property was leased.

MEXICO

Mexico

Mexico City.—The general manager, Felipe Pescador of National Railways of Mexico, including the old Mexican Central system, has issued a frank statement on the physical and traffic conditions of these lines. He says:

"To pretend that railroad service in Mexico is given with accommodations of former days would be devoid of reflection. Many passenger-coaches are lacking in usual interior equipment; in some the window-glass is broken, in many the seats are worn out, and it is impossible to get prompt repairs. Coaches which have been used in military service are in dilapidated condition. Train-schedules are difficult to maintain, as precautions have been taken against rebel bands. Generally speaking, however, service is normal and accidents not frequent. On the Interoceanic we have not been able to control the situation. Rebels have frequently torn-up the rails and attacked the trains. They have been very bad between Puebla and Jalapa, destroying the road and requiring guards of 100 or more soldiers to protect each repair-gang. Often we find newly repaired track again destroyed before a train can be got over it. The Mexican Central from Mexico City to La Colorado in Zacatecas may be said to be open. North of the latter point repairs have been made only as the military situation would permit work. Between Torreon and Chihuahua City, and north of the latter there have been frequent interruptions by Villa rebels. On the old Mexican Central's Gulf line from Monterrey to Tampico the roadbed is in bad condition, and repair work has been effected only with great difficulty. This is on account of scarcity of laborers and danger from rebels which infest that section. A tri-weekly service is maintained, however, also, tri-weekly trains are run each way between San Luis Potosi and Tampico. This last is also a part of the old Central system. Construction on the projected line from the city of Durango to Mazatlan, Sinaloa, continues; but completion of it is very remote. Laborers and money are needed in large amounts, and are both lacking. Over 100 kilometres of this line is in operation and material trains are being run over it. A part of the revenues of the National Railways is being used to re-build stations and other structures, as well as for renewing rails."

Nuevo Leon

Monterrey.—Preparations are being made by the American Smelting & Refining Co. to resume at an early date operation of its smelter at Asarco. Mechanics have been overhauling it for some time. This plant is in the division of the National Railways of Mexico that runs between Torreon and Durango. Ever since the revolutionary period began more than eight years ago the region around Asarco has been bandit-ridden. That this condition still exists, to some extent at least, is shown by the fact that only a few days ago the 'stub' passenger train that runs from Asarco to Velardena, where connection is made with the main line, was held up by bandits and all the passengers robbed. It is understood that pending restoration of complete tranquility, the Government will give military protection.

PHILIPPINE ISLANDS

Manila.—The Benguet Consolidated Mining Co., operating in the Benguet district, island of Luzon, during 1918 treated 23,539 tons of ore averaging $21.35 per ton. The residue assayed $2.34 per ton, giving an extraction of 89% of the gold. The loss was made up of 34 cents as dissolved and $2 as undissolved metal. There was shipped 160 bars, weighing 30,012.77 ounces, slightly over one ton. The average fineness was 664.4 in gold and 194.7 in silver, and the Mint value per ounce, $13.73. The total estimated value was $417,611. Added to this was the estimated value of slag produced, $35,400, giving a total production of $453,011 for the year. C. M. Eye is superintendent.

PERSONAL

Note.—The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Hennen Jennings is in San Francisco.

Maurice D. Leehey was here last week from Seattle.

Philip Wiseman has returned from New York to Los Angeles.

W. H. Aldridge is president of the Texas Gulf Sulphur Co., of New York.

F. H. Mason was in San Francisco last Saturday on his way from San Diego to Victoria, B. C.

Sergio Bagnara, recently in the Ordnance Department at Washington, is at Santa Rosa, California.

Cecil G. Fennell passed through San Francisco on his way from Arizona to the Pend Oreille region of Idaho.

Louis A. Wright is returning from Chile in the middle of April. His address will be 61 Broadway, New York.

H. Robinson Plate will be in charge of the operating end of the Golden Gate Exploration Co., with offices in the Hobart building.

Joseph H. Playter, manager of the Crown Mines at Golconda, Nevada, has returned to Golconda after professional work in California.

E. H. Nutter, of the Minerals Separation company, is in New York. His assistant, **Albert Roberts**, is now in the North-West and will go shortly to Utah.

Donald McLaughlin has been appointed geologist to the Cerro de Pasco Mining Co., and **H. I. Altshuler** has been appointed his assistant. The latter sails for Peru this week.

Robert D. Adams, well-known chrome and magnesite engineer in this State, who has been in northern Russia for several months with the Canadian forces, has been awarded the D. S. O.

Courtenay De Kalb has gone to Washington, on his way to Spain, as a commissioner appointed by the Department of Commerce to investigate the mining and metallurgical resources of that country.

Livingston Wernecke, geologist of the Alaska Treadwell and Alaska Juneau mines, is giving a course of lectures at the College of Mines, University of Washington, on the mining geology of the Juneau district.

James T. Norton, ore-dressing engineer with the U. S. Bureau of Mines, who has been engaged in work on war minerals at Minneapolis and Colorado Springs, has lately been transferred to Moscow, Idaho, to investigate the differential flotation of lead-zinc ore.

The fourth annual meeting of the American Association of Petroleum Geologists is to be held at Dallas, Texas, on March 13 to 15. W. E. Wrather is secretary.

Obituary

Anthony W. Barnard, who staked the first claim at Butte, Montana, died there on Feburary 27. He was 73 years old.

H. P. Tracy, advertising manager for the Denver Rock Drill Mfg. Co., died on February 18 from pneumonia following influenza.

James S. Austin, president of the Tonopah Mining Co., died suddenly at his home in Ardmore, Pennsylvania, on February 27.

Charles H. Gibbs, for the past few years general manager for the Wasatch Mines Co., Salt Lake City, died on February 18 from the effects of influenza. He leaves his widow and two children.

THE METAL MARKET

METAL PRICES

San Francisco, March 4

Aluminum dust large and small lots, cents per lb.	65—70
Antimony, cents per pound	8.00
Copper, electrolytic, cents per pound, in carload lots	16.00
Lead, pig, cents per pound	5.50— 6.50
Platinum per ounce	$100
Quicksilver per flask of 75 lb	$85
Spelter, cents per pound	9.00
Zinc dust cents per pound	15.00

EASTERN METAL MARKET

(By wire from New York)

March 4 —Copper is quiet though steadier. Lead is more active and firm. Spelter is dull but steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce, of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1 01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1 01½ per ounce. The British government fixed its maximum at 49½ pence, on September 2, but on November 12 this was changed to 48¾, on December 13 to 48 7/16, and in February to 47¾ pence.

The shortage of silver is adversely affecting the general trade situation all over China but its effects are much more serious in some portions of the country than in others, according to a recent U. S. Consular Report. In the interior districts of northern and central China comparatively good crops and general financial conditions have made the demand for the metal increasingly acute. In southern China, particularly the districts subsidiary to Hongkong, the demand is felt much less commercially, for despite the fact that the export of silver from Hongkong except for government account—even for the protection of Hongkong bank-notes—is prohibited, the Hongkong bank-note issues are always fully protected under the laws of the colony by the banking policy of the institutions issuing them. At times during the past year Hongkong bank-notes have circulated at a discount because they could be redeemed in silver only in Hongkong, whence no silver could be exported, whereas when native bank-notes were at par they represented silver obtainable on demand at least theoretically. But with the uncertainty of finances in China generally this condition continued for a short time only. Owing to the increasing discount of Canton notes silver could only be had in small amounts causing a considerable appreciation in the value of subsidiary coins and transactions, especially in import and export lines could be counted upon safely only in Hongkong bank-notes. In some districts in southern China the need of silver has been very acute—for example in the Kotchiu tin mines where silver for the payment of expenses could only be had from Shanghai at times, and then only on the payment of a considerable premium. In the districts near the Indo-China border there has been continued trouble due largely to the drain on the stocks of silver in these districts for the benefit of Indo-China. In a general way inter-city trade in the interior has been greatly retarded by a lack of silver and this has borne particularly heavy upon districts where it was necessary to have silver at any price. The result has been an inflated value of the Shanghai and northern China dollars compared with Hongkong dollars, exchange in favor of Shanghai most of the time. The respective stocks of silver in Shanghai and northern and central China, on the one hand and in Hongkong territory on the other, are rather significant.

Copper held by the Government, over 100,000,000 lb., is to be sold through the large copper-selling agencies.

Copper for export has been sold at 15 cents per lb., f.o.b.

With the lower price for copper comes a drop in refining charges. These were raised last year when the price was fixed at 26 cents per lb. As much as $35 per ton (1¾ cents per lb.) was paid by some mining companies to the refineries.

Casting copper has been sold at £68 per ton in London, equal to 14½ cents per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. On December 3 the War Industries Board fixed the price to consumers and jobbers at 72½c. f.o.b. Chicago and Eastern points, and 71½c. on the Pacific Coast. This will continue until the U. S. Steel Products Co.'s stock is consumed.

Eastern Metal Market

New York, February 26.

Demand is light for all metals, but in one or two the price tendency is firmer.

Antimony is inactive and unchanged.

Copper has reached lower levels again on sales of small quantities.

Lead has advanced, and there has been some buying and more inquiry.

Tin is still restricted, and is stale and stagnant.

Zinc is quiet, with the price situation easier.

ALUMINUM

Conditions are unchanged. Government maximum prices are nominally in effect until March 1 at 33 to 33.20c. per lb. for 50 to 1-ton lots, but No. 1 virgin metal, 98 to 99% pure, is obtainable at 31 to 32c. per lb., New York, for early delivery.

ANTIMONY

The market is quiet and demand is light. Wholesale lots are obtainable for future delivery at 7 to 7.12½c., New York, duty paid, with spot delivery at 6.87½ to 7c. per lb. In jobbing lots, quotations range from 7.37½ to 7.50c., New York.

COPPER

The market continues to fall, and there seems to be no bottom to it. On Monday, electrolytic copper had reached 16c., New York, and yesterday it was obtainable at 15.50c. Even this could be shaded by both large and small producers. There is evidently no control possible, and it is probably a question of supply and demand. The seriousness of the entire situation is exemplified, in the opinion of some, by the fact that one large copper company [the Kennecott Copper Corporation] recently borrowed $12,000,000 to carry its copper metal in stock, rather than sell it and take a loss now. Demand now is only hand to mouth and the total turnover is ridiculously small, as judged by normal times. Lake copper is nominal at about 16.25c., New York. As to Government stocks, it is stated that a plan is under consideration whereby producers and consumers or manufacturers may possibly take over this supply on some fixed basis. Copper for export is still held at 23c. The committee of the Copper Export Association, which went abroad some time ago to visit England, France, Italy, and Germany, is expected back about March 15.

IRON AND STEEL

The scheme of the Secretary of Commerce to establish prices on a lower plane is not looked on favorably by steel producers; it is regarded as more than a matter of price that is holding back business. There has been more evidence of price shading recently. In a sale of 3000 tons of plates, part for export to Canada, a cut of $2 per ton was made by three makers. Hard-steel bars have been sold at a concession of $2. There is not much export business so far. An inquiry for 12,000 tons of billets and 1200 tons of sheet-bars has come from Belgium, and a recent order for 50,000 boxes of tin-plate for export is said to have been closed at slightly above the domestic price.

LEAD

The American Smelting & Refining Co. advanced its price last week. On February 21 it announced an increase of 10 points to 5.10c., New York, and yesterday, February 25, one of 15 points more to 5.25c., New York, or 5c., St. Louis. The market has evidently reached bottom. Inquiry is better and a moderate business has been done in the past week at not under 5c., New York. Lead is really the first market to approximate stabilization.

TIN

The only really open market in tin is that in jobbing lots or under five tons. Such quantities can be purchased without a purchase license from the authorities controlling the larger market. Anything above five tons or more can only be secured from the United States Steel Products Co. at 72.50c., the fixed price, for allocated metal. Of the 10,000 tons allocated by the International Tin Executive to the United States, only about 4000 tons has been disposed of, it is said. This does not portend an early unrestricted market. There is no market now; it is dull, stale, and stagnant, and could hardly be otherwise. American electrolytic tin is obtainable at 69.12½c. per lb., New York, in small lots and at about 68.25c. in wholesale quantities. The 99% metal is quoted at under 67c. per lb., New York. Spot Straits in London is quoted at £213 per ton. Arrivals in February to the 17th were 1190 tons at Pacific and 50 tons at Atlantic ports.

ZINC

After a period of firmness covering several weeks—firm for markets like these—a weakness has developed that is reflected slightly in lower quotations. The market for prime Western for early delivery is down to 6.25c., St. Louis, or 6.60c., New York, today, with demand very light. A fair business for nearby delivery has been done in the last week or so at 6.30 to 6.40c., St. Louis, but the market is now quiet. It is believed that stocks are piling up rather than otherwise, which may explain the lower tendency. Producers generally are supposed by each other to be curtailing output, but it is probably a fact, as suggested by one dealer, that each one is expecting the other to cut his production, and as a result the yield has not been decreased as much as has been estimated.

ORES

Manganese Alloys: Ferro has sold in lots up to 300 tons in all at $150, delivered, establishing a market for the first time in many weeks. These sales include both re-sale material and some 80% alloy by one or two producers. Spiegel is nominal at $50 to $53, delivered, with inquiry light.

Molybdenum: The market is quiet with quotations nominal at 85c. per lb. of MoS_2 in 85 to 90% material.

Tungsten: Prices are not obtainable in the absence of any testing of the market, but the condition has not improved. Ferro is said to be obtainable at less than $1.50 per lb. of contained tungsten, but no definite quotations are available.

Production of fuel briquettes in the United States in 1918 was 477,235 net tons, valued at $3,212,793, an increase, compared with 1917, of 70,379 tons, or 17%, in quantity, and of $978,905, or 44%, in value. The output in 1918, which represented the results of the third successive year of material progress in the industry, was the highest yet recorded. It was more than double that in 1915, according to the U. S. Geological Survey.

Value of the primary aluminum produced in the United States in 1918, as reported by the U. S. Geological Survey, was $41,159,225, a decrease of $4,722,775, or 10% from the value in 1917. The decrease is due largely to a decline in the price of aluminum during 1918, and does not represent a corresponding decline in quantity of output.

Company Reports

BARNES-KING DEVELOPMENT CO.

Property: mines and mills at Kendall and Marysville, Montana.

Operating Official: G. T. McGee, general manager. At the North Moccasin. T. W Heatherley in the mine, A. E. Worsdell in the mill, C. A. Morgan in the office, E. G. R. Manwaring, mining engineer, and W. A. Young, assaying. At the Piegan-Gloster: J. H. McCormick in the mill, J. W. Johns in the mine, William McClean, mechanical engineer, F. C. Eccles in the office, and Ward Cole, assaying. At the Shannon: J. W. Johns in the mine and J. E. Goyer in the office. At the Kendall: A. B. Fox in the power-plant.

Financial Statement: the operating profit in 1918 was $189,313, less $49,980 for taxes, development of outside claims, etc., leaving $139,333 net. Current assets at December 31, 1918, amounted to $198,246, and liabilities $42,229. Cash at that date was $88,808.

Dividends: four absorbed $160,000, making a total of $260,000.

Development and Production:

Mine	Feet	Tons	Gold	Profit	Cost per ton
Kendall (leased)	...	7,152	$12,873	$657	....
North Moccasin .	3384	21,378	178,230	16,926	$7.56
Piegan-Gloster . .	2890	15,338	141,326	16,941	10.20
Shannon	4359	26,048	349,138	163,110	6.89
Total . .	10,633	69,916	$681,577	197,634	

In the North Moccasin, exploration on the lowest level was unsatisfactory. Reserves are 5255 tons of $8.90 ore, consisting mainly of pillars. In the Piegan-Gloster, the advance of the 500-ft. level, 937 ft. west, cut four ore-shoots with a combined length of 350 ft. They do not appear to extend far above the level. Reserves are 2835 tons of $7.30 ore in the Shannon, only 100 ft. of the 620 ft. opened on the vein at the 650-ft. level was of milling value. In the 500-ft. level a new shoot was opened for 400 ft. of good value.

Milling Data: the Gloster mill treated 41,386 tons of ore from the Piegan-Gloster and Shannon mines, extracting gold worth $443,513 and silver worth $49,084. The ore assayed $11.56 per ton, of which 95.6% was extracted. The milling cost was $2 per ton. At the North Moccasin the extraction was 93.4%; cyanide and zinc consumption, ½ lb. each per ton; and lime, 3.4 pounds.

ENGELS COPPER MINING CO.

Property: mines, tramways, mills, and railroad in Plumas county, California; the mining claims covering 3175 acres.

Operating Official: E. E. Paxton, general manager.

Financial Statement: gross earnings in 1918 totaled $1,781,637. Operations cost $1,302,464, leaving $479,173 net. Deducting depreciation, depletion, and compensation liability— $429,249, the balance to profit was $49,925; and adding the balance of $400,210 from 1917, there was available $450,135. After paying dividends the balance at December 31, 1918, was $179,882. Current assets totaled $531,681, and liabilities $324,585. Since operations started, the company has expended $1,165,720 in cash. During 1918, additions to capital investment totaled $489,089 net. The entire property is valued at $960,982, but ore broken in stopes, ready to mill, represents a net value of at least that sum.

Dividends: in 1918 the sum of $269,979 was distributed.

Development: there was a total of 25,181 ft. of work done last year. At the upper, or Engels mine, the three-compartment shaft was driven from the surface to a depth of 400 ft., and is well equipped with a large Nordberg hoist, capable of hauling from 2000 to 3000 tons of ore daily. This shaft is being sunk as rapidly as possible below No. 6 level, and at 200 ft. a new level, No. 7, will be opened. The ore from No. 7 will be hoisted to No. 6, from there transported by rail and aerial tram to the Superior mill. No. 6 tunnel has been extended in the main orebody for a distance of 600 ft. Fifteen cross-cuts have been driven from the main tunnel partly blocking the ore on that level. The main tunnel will be extended at least 200 ft. farther in continuous ore already developed by diamond-drilling. The first ore opened on No. 6 level, 1800 ft. from the portal, is now being opened, and promises a large deposit of chalcocite ore of high-milling grade. As yet this ore is separate from the main body, but may connect with the same at depth. A deep diamond-drill hole, driven at an angle of 58° and crosscutting the orebody, carried value for a depth of nearly 600 ft., and high-grade ore for nearly 300 ft. below No. 6.

At the Superior mine a large stope, 500 ft. long by an average width of 120 ft., has been opened on the main orebody on No. 1 level. In addition to this two other shoots are also being developed, with stopes from 100 to 300 ft. in length and of varying width, from 10 to 40 ft. The main tunnel, cross-cutting the orebodies in the Superior, is now being driven toward another large deposit disclosed last year by diamond-drill. No. 2 level, 200 ft. below No. 1, is now being opened, and already a large quantity of ore has been developed. The three-compartment shaft at the Superior has been sunk to a depth of 342 ft.; this ultimately will be extended not less than 1000 ft., and is well equipped with hoisting machinery for handling large tonnage at that depth.

During the past two years there has been expended $23,690 on diamond-drilling, but the results have more than justified the cost, as the basis of the value of any mining property depends first, on the amount of probable ore, and second, on the amount of ore blocked and ready for milling. There was also expended during the past year a total of $197,379 on mine development, that is, in driving, raising, and blocking out the ore, which to a considerable extent accounts for the high cost of operation. With the work already accomplished and planned for the coming year (1919) the mines are in good condition for yielding 2000 tons of ore daily.

The tonnage of ore blocked out by the stopes now being excavated, is shown below:

	Engels	Superior	Total
Blocked above stopes, tons.....	1,400,000	500,000	1,900,000
Broken in stopes, tons.........	350,000	25,000	375,000
Total	1,750,000	525,000	2,275,000

During the past year 1,200,000 tons of additional reserves have been blocked and 90,000 tons added to broken ore in stopes, the cost of which has been charged to operating expense. In addition to the foregoing blocked reserve, further driving and diamond-drilling in both mines have disclosed probable orebodies of many times the amount actually blocked, already insuring a long life to the property on large-scale operations.

Production: the two mills concentrated, by flotation, a total of 265,888 tons of ore, averaging 2.23% copper. This yielded 9,244,069 lb. of copper, 1108 oz. of gold, and 119,708 oz. of silver. The quantity treated was an increase of 71% over that of 1917. The average recovery was 77.94%, somewhat low due to the inclusion of some carbonate ore. With the 748 tons of crude ore shipped direct to smelter, the output was 9,419,957 lb. of copper, 1131 oz. of gold, and 114,262 oz. of silver. Since 1915, there has been treated 622,485 tons for 22,566,239 lb. The plants were enlarged last year, and additions are under way in 1919.

Costs: operations cost 11.73c., development 2.10c., freight and smelting 5.75c., a total of 19.58c. per lb. of copper. The price received was 24.68c. Reductions have been made so that total charges are now [February 1919] 16.50c., but when normal conditions are prevailing this is expected to be lowered to 11 cents.

Mining Decisions

Mineral Leases of Washington State Lands

Under the laws of the State of Washington mineral leases of State lands may be had in legal sub-divisions upon application by the discoverer of precious minerals therein to the State Commissioner of Public Lands.

State v. Savidge (Washington), 175 Pacific, 568.

Party in Possession—Right to Enjoin Trespass

Where a plaintiff has been in open, peaceable, and notorious possession of land, even though his legal title thereto is not well established, he will be awarded an injunction against the forcible entry of defendant under a claim of legal title made for the purpose of extracting oil from the land.

Colher v. Bartlett (Oklahoma), 175 Pacific, 247.

Miners' Liens—Not Available to Superintendent

The claim of an oil-well superintendent for unpaid salary cannot be made the basis for a miner's lien in California. Such liens are only for the benefit of those who perform manual labor on the property in question. A lien cannot be filed until after the claimant has ceased to labor.

McCreary v. Toronto Midway Oil Co. (California), 175 Pacific, 87.

Severance of Minerals—Adverse Possession

A purchaser of land having notice that the minerals have been severed by deeds from the surface, cannot claim adverse possession of the minerals through adverse possession of the surface. Adverse possession of the minerals can be obtained only by actual working of them or some other act of domain over them showing assertion of title and use in accordance therewith.

Midkiff v. Colton (West Virginia), 252 Federal, 420.

Adverse Possession—What Does Not Constitute

Where there has been severance of title to land and underlying minerals, the owner of the surface, in possession thereof, does not acquire title to the coal by taking from existing openings of the veins coal for his own domestic purposes and occasionally permitting neighbors to take it, or himself digging it and selling it to them for their domestic use. Such evidence does not establish adverse possession of the coal.

Vance v. Clark (West Virginia), 252 Federal, 495.

Mining Location—Abandonment and Re-location
